THE INTERNATIONAL CYCLOPÆDIA.

DISRAELI, BENJAMIN, Earl of BEACONSFIELD, author and statesman, eldest son of ISAAC, was b. in London, 1804; he received a private education, which was carefully superintended by his father. At the age when most other young men who rise to political distinction are sent to a university, he was articled to a solicitor, with a view of qualifying him for a situation in a government office, which had been obtained for him by his father. The drudgery of a lawyer's office being distasteful to him, he contributed to a tory journal, the *Representative*, which came to an untimely end. In 1837, he published his novel *Vivian Grey*, which was succeeded at intervals by other brilliant works of fiction, including *The Young Duke*; *Contarini Fleming*; *The Wondrous Tale of Alroy*; and *Henrietta Temple*. He also wrote *The Rise of Iskander*; *A Vindication of the British Constitution*; and *The Revolutionary Epic*. After visiting Italy, Greece, Turkey, and Syria, he returned to England, to find the country involved in the reform bill agitation. His sympathies appear now to have inclined to radicalism in politics; and having obtained recommendations from Mr. Hume and Mr. O'Connell, he presented himself in 1832 to the electors of Wycombe, but was defeated. At the general election in 1835, he met with no better success. In April in the same year, he contested Taunton on conservative principles, but again without success. In 1837, his desire for a political career being unabated, he contested Maidstone in the conservative interest along with Mr. Wyndham Lewis. He was elected, and at the age of 32 took his seat in the house of commons. His maiden speech, which was in a high-flown style, and delivered with extravagant gestures, excited the laughter of the house of commons. He was so much disconcerted, that he stopped short abruptly, but not without uttering the remarkable prophecy: "I shall sit down now, but the time will come when you will hear me." In 1838, Mr. W. Lewis died, and in the following year D. married the widow of his late colleague. He then carefully studied the style of successful parliamentary orators, making few speeches. It was not till 1849 that he began to attract notice, and not long afterwards he gained the ear of the house as the leader of the Young England party. After entering parliament, D. wrote several novels—*Coningsby* (1844); *Sybil* (1845); and *Tancred* (1847), in which the principles of Young England are most ingeniously blended with theories about the intellectual supremacy of the Jews, inaccurate scientific notions, and misconceptions of English social life. At the general election in 1841, he obtained a seat for Shrewsbury. He then became the organ of the dissatisfaction with which the landed aristocracy and country gentry regarded sir Robert Peel's relaxations of the system of protection to native industry. His brilliant invective and polished sarcasm inspired the protectionist party with fallacious hope and confidence. On the death of lord George Bentinck in 1848, D. succeeded to the leadership of the protectionist party in the commons. He bore generous testimony to the political consistency and private worth of his predecessor in his *Lord George Bentinck, a Biography*. In 1852, the earl of Derby, having undertaken the construction of a cabinet, offered him the post of chancellor of the exchequer. It was the first time a brilliant novelist had ever figured as the finance minister of a great commercial state and it argues well for the versatility of his genius that he emerged with honor and credit from the ordeal. His second budget, in 1853, failed, however, to find acceptance with the house of commons, and the government being outvoted upon it, the Derby cabinet ceased to exist. D. resumed the leadership of the opposition, from which he was again summoned in 1858, to fill the post of chancellor of the exchequer in the second administration of lord Derby. In 1859, he introduced a measure of parliamentary reform, which, being thrown out, was followed by the resignation of the government. For seven years the liberals remained in power, and Mr. Disraeli, in opposition, displayed talents as a debater, and a spirit and persistency under defeat, which won for him the admiration of his opponents. When lord Derby returned to power in July, 1866, D. again returned to the post of chancellor of the exchequer. It was he chiefly who induced the conservative party to pass the reform bill of 1867, his argument being, that the working-class householders are more conservative than those to whom the franchise had been previously extended. In Feb., 1868, D. succeeded lord Derby as

premier, but, in the face of a hostile majority, he resigned in the following Dec. On this occasion, Mrs. Disraeli, in acknowledgment of her husband's services, was raised to the peerage as viscountess Beaconsfield (died 1872). In 1870, D. published another novel, *Lothair*, marked by most of the merits and defects of those which preceded it. In 1873, the popularity of Mr. Gladstone subsided, and the election of 1874 giving the conservatives a large majority, D. returned to power as prime-minister. In 1877, D. took his seat in the upper house as Earl of Beaconsfield. Still premier, the earl was the guiding spirit of his cabinet during the critical years 1877-78, seeking by energetic action in eastern affairs to give an "imperial" character to English policy; and he returned from the congress of Berlin bringing, as he said, "peace with honor." D. was LL.D. of Edinburgh, D.C.L. of Oxford, and was twice made lord rector of Glasgow university, and held many other honorary offices and titles. The elections of the year 1880 were a surprise to all parties in England. It had been known that there was considerable dissatisfaction with D.'s foreign policy, with the theatrical manner in which he sprang his diplomatic surprises upon the public, with the Royal Titles bill, which he had fathered and carried through parliament, and with the Afghan and Transvaal wars, which had just broken out. The Liberals, therefore, had looked forward to making some parliamentary gains, and a few of the more sanguine had even had hopes of overturning the D. administration by a small majority. The returns showed a sweeping defeat of the Conservatives, the new parliament numbering 349 Liberals, 243 Conservatives, and 60 Home Rulers. D. thereupon resigned his premiership and was succeeded by Gladstone. During his retirement he sometimes spoke in the House of Lords in indignant and sarcastic protest at the reversal of his favorite measures. He also published his last work of fiction, *Endymion*, 1880. He died at his house in Curzon street, London, 1881, April 19, and was buried on the 26th in the churchyard of Hughenden, Buckinghamshire. See *Lord Beaconsfield's Correspondence with his sister*, 1832-52 (1886); his *Selected Speeches*, edited by Kebbel (2 vols. 1882); Clayden, *England under Lord Beaconsfield* (1880); Thompson, *Public Opinion and Lord Beaconsfield* (1886); the *Lives* by John Mill (1863), O'Connor (hostile, 1879), Brandes (trans. 1880), Clarigny (French, 1880), Ewald (1882), Hitchman (1885), Kebbel (1888), Froude (1890).

DISRAELI, ISAAC, D.C.L., a well-known English author, was the descendant of a Hebrew family which flourished first in Spain, and afterwards in Italy. His father, Benjamin D'Israeli, came to England in 1748, entered into business in London, amassed a fortune while yet in middle life, and retiring to Enfield, there died in 1817, aged 90. His son Isaac, born at Enfield in 1766, was educated at Amsterdam and Leyden. He commenced his career as a poet and novelist; but, after the publication of the first volume of his *Curiosities of Literature* (1791), he discovered that his forte lay not in creative literature, but in the illustration of history and literary character, and to this he devoted himself. His style is elegant and pleasing, presenting the fruits of antiquarian research and study without their dryness and general want of connection. No writer is more instructively amusing or amusingly instructive than he. Lord Byron speaks of him as "that most entertaining and searching writer." D. died in 1848.

D.'s principal works are the *Curiosities of Literature* (1791-1823; new edition, with Life, Lond. 1851); *A Dissertation on Anecdotes* (1793); *Essay on the Manners and Genius of the Literary Character* (1795, 14th ed., 1850); *Inquiry into the Literary and Political Character of King James I.* (1816); *Commentaries on the Life and Reign of Charles I.* (1828-31); *Eliot, Hampden, and Pym* (1832); *Amenities of Literature* (1841)—for which he received from the university of Oxford the honor of D.C.L.

DISRUPTION. See FREE CHURCH OF SCOTLAND.

DISSECTION. See ANATOMY, in Law.

DISSECTION WOUNDS. The practical study of anatomy is attended with certain dangers, which, however, during the last quarter of a century have been much lessened. The atmosphere of the dissecting-room, now comparatively pure by the application of proper ventilation and other sanitary measures, was, less than a generation ago, too commonly loaded with noxious emanations, which more or less poisoned the blood of those who continuously inhaled it, and consequently produced nausea, sickness, diarrhea, a bad taste in the mouth, and other symptoms. D. W., which are always attended with a certain amount of risk, were rendered more dangerous by the low state of the system, induced by the depressing influence of the surrounding air. Now, probably in consequence partly of the purer air, and partly of the general and extensive use of antiseptic injections into the vessels of the subjects to be dissected, it rarely happens that severe symptoms follow a cut or puncture. We may incidentally remark that a puncture in making a post-mortem examination, when the body is comparatively fresh, is much more likely to be followed by serious consequences than a wound in the dissecting-room in which the bodies have been lying for some weeks.

In the great majority of cases, punctures or cuts in the dissecting-room are followed by no unpleasant results; it being an established rule, that every puncture should be carefully sucked as soon as it is observed, and then freely touched with nitrate of silver. When, however, the poison has been absorbed, and is going to act, the patient begins to have a feeling of general illness in less than 24 hours. He is low-spirited, faint, and chilly, and often complains of nausea. Then come rigors, intense headache, rapid and sharp (but weak) pulse, a coated tongue, vomiting (sometimes), and great restlessness.

The first local symptom is intense pain in the shoulder of the wounded side, which is followed by fullness of the neck and armpit, extending in the form of a doughy swelling down the side of the trunk, and assuming a pinkish tint.

The general symptoms increase in severity, the breathing becoming difficult, the pulse very rapid and weaker, the tongue dry, brown, and often tremulous when protruded, and the skin more or less yellow. The case may terminate fatally at or before this stage; or abscesses may continue to form, from which the patient may more slowly sink; or if he survive, the arm may remain stiff and useless, or some of the fingers may be destroyed by gangrene. In the article POISONS we have noticed the rapidity with which death occasionally ensues in these cases. The essential points of treatment are briefly summed up as follows by Dr. Druitt in his excellent remarks on this subject in *The Surgeon's Vademecum*: "The indications clearly are to eliminate the poison from the blood; to support the strength; and to relieve pain, and promote the discharge of pus or sloughs." The treatment, both general and local, is, however, so similar to that of pyæmia, that it is sufficient to refer our readers to that article.

As a precautionary measure in post-mortem examinations, the surgeon, especially if he be out of health, or if the patient have died from a disease of an erysipelatous character, should thoroughly anoint his hands with lard. Very thin india-rubber gloves have been recommended as a safeguard to dissectors; but they have not been found to answer; probably from the constraint to which they subject the action of the fingers.

DISSEISIN. See SASINE.

DISSENTERS, the common appellation of those who dissent or differ from the established church of their country in any of its doctrines, or in any part of its constitution, and therefore separate themselves from it. Although sometimes employed as a sufficiently appropriate designation of the sects which separated themselves from the general body of the church during the early and middle ages, the term D. belongs to modern times and Protestant countries; the claims of the Roman Catholic church, where dominant, having always been asserted in a manner incompatible with the existence of recognized religious dissent. The measure in which the rights of D. are conceded by law, may be esteemed a fair test of the religious liberty enjoyed in a country, and of the general enlightenment of a people. The term D. is of English origin and growth, although its almost exact equivalent may be said to have existed in Poland in the name *dissidents*, a term which first appears in the acts of the Warsaw confederation of 1573, and there denotes the Polish Protestants, in contradistinction to the members of the established Catholic religion. After 1632, the term dissidents was applied in Poland to all who were not Roman Catholics, such as Lutherans, Calvinists, Greeks, Armenians, etc.

In England, the term D. appears to have come into use in the 17th c., as synonymous with *nonconformists*; and from England its use was transferred to Scotland in the 18th c., after the Secession church had been founded in that country. It is usually applied to those who agree with the established church in the most essential doctrines, but differ from it on some minor point, or on questions of church-government, relation to the state, rites, etc., as in England to Presbyterians, Independents, and Baptists. The claim of the church of Rome to be regarded as the Catholic church prevents its members from accepting the name D., and others seldom seek to apply it to them. On somewhat similar grounds, it is rejected by *Episcopalians* in Scotland; and for very different reasons, to be found in the peculiar circumstances which attended their growth, the *Methodist* (q. v.) churches are seldom included in it, as ordinarily used. See ESTABLISHED CHURCH; NONCONFORMISTS; PURITANS; UNITED PRESBYTERIAN CHURCH; TOLERATION, etc.

The term D. is not strictly legal or ecclesiastical, those to whom it applies being usually described in legal language by a periphrasis. It is in Gt. Britain a convenient term to designate those Protestant denominations which have dissented from the doctrine and practice of the church as by law established. Immediately after the reformation, D., or nonconformists, as they were then called, were subjected to severe restrictions and penalties. "During the rebellion, the laws against Protestant sectaries were repealed; but they revived at the restoration; and the parliament of Charles II. proceeded to enforce systematically, by new measures of vigor, the principle of universal conformity to the established church."—*Stephen's Com.*, iii. 53. By 1 Will. and Mary, c. 18, the restrictions on D. were first relaxed, and certain denominations were suffered to exercise their own religious observances. From that period, various statutes have been passed, each extending in some degree the free exercise of religious opinion. At the present time, D. of all denominations are allowed to practice without restraint their own system of religious worship and discipline. They are entitled to their own places of worship, and to maintain schools for instruction in their own opinions. They are also permitted, in their character as householders, to sit and vote in the parish vestries. A dissenter, if a patron of a church, may also exercise his own judgment in appointing a clergyman of the church of England to a vacant living.

Since the beginning of the 18th c., the Presbyterian, Independent or Congregationalist, and Baptist denominations in England, have been associated under the name of the *Three Denominations*. This association was fully organized in 1727, and enjoys—like the established clergy of London and the two great universities—the remarkable privi-

lege of approaching the sovereign on the throne. Notwithstanding much weakness, arising from doctrinal and other differences, this association has contributed much to promote toleration and religious liberty in England.

DISSEPIMENT (Lat. *dissepio*, I separate), in botany, the partition between two carpels (q.v.) in an ovary or fruit composed of a number of carpels. A D. is formed by the union of the sides of two carpels. Sometimes dissepiments meet in the center or axis, completely dividing the ovary or fruit into cells; sometimes they are partial, appearing as mere projections from the outer walls of the ovary or fruit, and leaving it one-celled. Many ovaries and fruits exhibit partitions not formed by the union of the sides of carpels; these are sometimes called *spurious dissepiments*.

DISSOCIATION, or **DISASSOCIATION**, a word belonging to the nomenclature of chemistry, first adopted by Henry St. Clair Deville to express the influence of heat in the decomposition of compound bodies. In a paper presented to the French institute, 1857, he says that "by selecting a proper compound and heating it sufficiently, the distance between the molecules can be increased to such extent that they will separate into their elementary conditions." He holds that water may be thus dissociated into its constituent elements at the temperature of melted silver. Deville placed a tube of porous porcelain within a tube of glass, and provided each with a separate outlet. He passed hydrogen through the inner tube, and carbonic acid through the annular space; both the gases passed through the pores of the septum, and a combustible gas issued from the carbonic acid tube. Thus far the experiment was not new. He now placed the tubes in a furnace heated to between 1000° and 1300° C., and substituted steam for the hydrogen of the inner tube. Part of the steam was decomposed, the hydrogen passing through the porous matter to the outer tube, and a corresponding portion of carbonic acid entering the inner tube by the same route. Some hydrogen was lost by combining with oxygen of the carbonic acid, $\text{CO}_2 + \text{H}_2$ yielding $\text{CO} + \text{H}_2\text{O}$. From the inner tube came steam, carbonic acid, and oxygen, from which the oxygen was easily isolated; from the outer tube came steam, carbonic acid, carbonic oxide, and hydrogen, from which the hydrogen was also isolated. If the carbonic acid of the process were derived from the furnace which furnished the heat, and the steam were generated by the same heat, there results from the heating of water in this apparatus a certain quantity of separated oxygen and hydrogen, which might be used for the production of light and heat. By a modification of this process, sulphurous acid was separated, at 1200° C., into sulphur and anhydrous sulphuric acid; hydrochloric acid into hydrogen and chlorine; carbonic oxide into carbon and carbonic acid; and carbonic acid into carbonic oxide and oxygen. The economic value of this discovery is yet a problem. Lamy has applied it to the preparation of a pyrometer for showing high temperatures.

DISSOLUTION OF MARRIAGE. See **DIVORCE**.

DISSOLVING VIEWS are pictures painted upon glass, and made to appear of great size and with great distinctness upon a wall by means of a magic lantern with strong lenses and an intense oxyhydrogen light, and then—by removal of the glass from the focus, and gradual increase of its distance—apparently dissolved into a haze, through which a second picture is made to appear by means of a second slide, at first with a feeble, and afterwards with a strong light. Subjects are chosen to which such an optical illusion is adapted, such as representations of the same object or landscape at different periods. Dissolving views were invented and first exhibited as a popular entertainment in England.

DIS'SONANCE is the opposite of consonance, and is applied to those intervals in music whose relative proportions are to a certain extent unsatisfactory to the ear, and produce a degree of disquietude. In a special sense, the term dissonance is applied to the interval causing the unpleasant effect; which sound is not always, as some think, the upper note, but may be the middle or the lowest note. Many believe that the feeling of dissatisfaction produced by the dissonances of music, arises from the mind not being able without difficulty to comprehend at once the arithmetical proportions of the vibrations. The foundation of dissonance, however, is generally allowed to be more æsthetic than intellectual, as through the vibrations of a sounding body the air is put into a similar state of vibration, which is communicated to our ear, and so to our whole nervous system, through which we obtain the inward feeling representing the sound. In music, dissonance may be called a necessary æsthetic evil, which is used in the finest musical works for the purpose of producing pleasing contrasts, with their resolutions. In modern music, dissonance is divided into *essential* and *accidental*; the former arising fundamentally, the latter arising from passing notes, anticipations, suspensions, etc. See **HARMONY**.

DISTAFF, the staff on which the flax or wool is fastened, and from which the thread is drawn in spinning. A distaff of a very elegant construction is represented in art, and was no doubt generally used in antiquity. It is made of a cane-stick, the top of which is slit in such a manner as that the portions, when bent downwards, form a receptacle for the flax or wool. A ring was put over the top, for the purpose of keeping the divided ends of the cane together. The distaff was dedicated to Pallas; and the Fates are always represented with it, and engaged in spinning the thread of life. It has ever

been considered as the peculiar emblem of feminine as opposed to male occupations, and has come to be used figuratively for a woman.

DISTANCE. The limit of view in a picture, or *point of distance*, as it is called in perspective, is that portion of the picture where the visual rays meet; the *middle distance* being the central portion between the extreme distance and the foreground. The art of producing on the eye the effect of real distance, in so far as it is not accomplished by mere mechanical rules, is one of the most subtle branches of landscape-painting, and cannot be acquired otherwise than by long experience, and a careful study of the effects of light and shade.

DISTEMPER (Fr. *détrempe*), a coarse mode of painting, in which the colors—of a commoner kind than those usually employed for artistic purposes—are mixed in a watery glue, such as size and whiting. The chief purposes for which distemper is now used are scene-painting and staining-papers for walls. But it is known that the old masters frequently executed pictures and portions of pictures in distemper, and then oiled them, by which means they acquired the character of being painted originally in oil. It is said that Paul Veronese sometimes began his pictures in distemper, and finished them in oil, and that he frequently painted his skies in distemper. Distemper is often ignorantly supposed to be identical with fresco (q.v.). The difference is, that whilst in the former the colors are laid on a dry surface, in the latter they are put on wet mortar or plaster. See WIERTZ, ANTOINE.

DISTEMPER is a typhoid inflammation affecting the upper air-passages of young dogs, and resembling in many respects the strangles of young horses, and the scarlatina and other such complaints of children. Like these, it is generally contagious, occurs only once in a lifetime, runs a definite course, is accompanied by low fever and debility, and is most successfully treated by good nursing and attention to diet and regimen. The eyes are red, weak and watery; the nose dry and hot; draughts of air or movements of the animal readily excite sneezing or cough; there is dullness, fever, and loss of appetite. The thickened slimy mucus which the inflamed membrane, after some days, secretes, accumulates about the eyes and nostrils, and lodging in the bronchial tubes, prevents the free access of air, and the proper purification of the blood. Hence ensue distressed breathing, increasing weakness, and symptoms of nervous disturbance, such as staggering gait, chorea (q.v.), and fits. All dogs are liable to distemper, but the delicate, highly bred, and artificially treated varieties suffer most severely, and amongst them the mortality is very great. Bleeding, physicking, and all irritating and reducing remedies, must be carefully avoided, and a good dry bed in a comfortable airy place provided. The stomach, which is generally overloaded, should be relieved of its contents by an emetic, which, for an ordinary-sized English terrier, may consist of two grains each of tartar emetic and ipecacuanha, with eight or ten grains of common salt, given in a wine-glassful of tepid water. If no effect is produced, the dose must be repeated in twenty minutes. Constipation, if present, should be corrected by half an ounce each of castor and olive oil, to which, in large dogs, a few grains of gray powder is a useful addition. The febrile symptoms, if acute, may be alleviated by giving four times daily, in cold water, two drops of tincture of aconite, and five grains each of niter and extract of belladonna. Distressed breathing will be relieved by applying to the chest and sides, for an hour or two continuously, a thick flannel cloth, wrung at short intervals out of hot water. The throat may also be rubbed with hartshorn and oil, and the nostrils sponged and steamed occasionally. Give frequently, and in small quantities at a time, milk and bread, or any other such simple and digestible food; and when recovery is tardy, and weakness ensues, endeavor by nursing, tonics (q.v.), and stimulants (q.v.) to support the strength.

The term D. is sometimes applied to influenza (q.v.) in horses, and epizootic pleuro-pneumonia (q.v.) in cattle.

DISTICH (Gr. *distichos*, consisting of two rows or ranks) is the classical name given to any two lines, but especially to a hexameter and pentameter, making complete sense. It was much used by the Greeks and Romans as a vehicle for the expression of single thoughts and sentiments; and hence became almost exclusively employed for the classical epigram. The great poets of modern Germany, Goethe, Schiller, etc., have also shown a fondness for the D., and remarkable skill in the use of it. A collection of moral maxims in Latin, ascribed to a certain Cato, Dionysius (q.v.), are called *Disticha*, and were highly popular during the middle ages.

DISTILLATION is an important process in the arts. It consists essentially in converting a liquid into vapor in a close vessel, by means of heat, and then conveying the vapor into another cool vessel, where it is condensed again into a liquid. When applied to a solid, the process is called *sublimation*. The object of D. is to separate one substance from others with which it may be mixed. In D. proper, no chemical decomposition takes place; when any of the substances are decomposed, it is called destructive D. (q.v.). The possibility of separating substances by vaporizing them, depends upon the fact that very few substances are volatile at the same temperature. Thus, water boils or becomes rapidly converted into vapor at 212°, alcohol at 173°, sulphuric ether at 94.8, while oil of turpentine must be raised to 318°, and mercury to 662°; and some sub

stances, again, are altogether *fixed*. By applying the proper degree of heat, then, *and no more*, the more volatile of two substances may be expelled from the less volatile; and supposing the vapors of the two to rise mixed, as they are gradually cooled, that of the less volatile will be condensed before the other, thus affording another opportunity of separation.

It is often, however, not so easy to obtain a perfectly pure product by distillation as might at first appear, owing to another fact in chemistry—namely, that many bodies which, when pure, require a high temperature to vaporize them, become more easily vaporized when mixed with substances more volatile than themselves. Owing to this, it is impossible to obtain, by D. alone, alcohol perfectly free from water. The circumstance, on the other hand, is sometimes turned to good account in another way. By distilling, for instance, parts of plants with water, the essential oils pass over with the steam, and are then separated from the condensed water by other processes.

The applications of D. are numerous both in chemistry and in the practical arts. Pure water is obtained by D., the most of the substances dissolved in natural waters being fixed. Sea-water may thus be rendered drinkable, and there are apparatus for the special purpose. But wherever there are cooking-utensils, a distilling apparatus might be improvised. The pure water that descends from the clouds is produced in a way which is just the process we are speaking of on a large scale. See EVAPORATION. It is no figure of speech to say that the dews are “distilled.”

The extraction of zinc from the ore is a distillation; the metal, when reduced, passes over in vapor, and is condensed in a separate vessel. When the zinc ore contains cadmium, this metal, being more volatile, comes over in the first portions, and may be removed. When mercury is used to extract particles of gold from sand, the mercury is distilled off from the amalgam, leaving the gold, which is fixed. The mercury being condensed, is again ready for use.

The most extensive application of distillation is in the manufacture of intoxicating spirits, and in ordinary language this is the most common use of the word. Strictly speaking, indeed, the spirits are not produced by the act of distillation; that is done by the previous step of fermentation (q.v.); and distillation merely separates the spirits from the mixture in which they already exist. But it may be as well to give some account of the whole process under this head.

All the intoxicating drinks used in ancient times seem to have been the products of fermentation merely. The art, as it has been called, of evoking the fiery demon of drunkenness from his attempered state in wine and beer, is a discovery of modern times. It is first mentioned by an Arabian physician of the 11th c., Abulkasem, though the invention is attributed by some to the northern nations. The name *aqua vitæ*, given to distilled spirits by early physicians and alchemists, shows what an estimate they made of the discovery. Raymond Lully “declares this admirable essence to be an emanation of the divinity, an element newly revealed to man, but hid from antiquity, because the human race were then too young to need this beverage, destined to revive the energies of modern decrepitude.” Sadly have these anticipations been belied!

Spirits were first distilled from wine, and hence called spirits of wine. An endless variety of substances are now used in this extensive manufacture. Alcohol (q.v.) is the essential ingredient of all spirits, and it results from the decomposition of sugar, which, by the process of fermentation, is resolved into carbonic acid and alcohol. Sugar, then, is the direct source of alcohol, and accordingly all vegetable products containing sugar, such as grapes, the sugar-cane, sweet fruits, beet-root, etc., may be used in the manufacture of spirits. But there is another more abundant vegetable substance—namely, *starch*—which is easily convertible into sugar, and thus becomes indirectly a source of alcohol. In malt, and in germinating seeds generally, there is found a substance called *diastase* (q.v.). If a small quantity of this, or of an infusion of malt, be added to a paste of starch, it will in a short time become thin and sweet, the whole of the starch being transformed into sugar. See BEER. It is thus that grain of all kinds, potatoes, and other substances which contain little or no free sugar, are yet capable of yielding alcoholic spirits.

All substances, then, containing either sugar or starch, or both, will yield spirits. With sugar, the manufacture consists of two processes—fermentation and distillation. When starch is the original source, as is more commonly the case in the distilleries of this country, the first step is to convert it into sugar, or to *saccharify* it. This is the object of what is technically called *mashing*, which consists in mixing the materials in a triturated state with water at the temperature of about 160°. It is mostly from barley, oats, and rye that spirits are manufactured; wheat is less used, owing to its cost. Raw grain is ground to meal; malt is only bruised. A certain proportion of malt is always used, even in distilling from raw grain or potatoes, as the diastase of the malt is necessary to set agoing the saccharine fermentation. After being agitated for two or three hours, the saccharine infusion, called *wort*, is drawn off from the grains, and cooled. To this wort is now added a certain quantity of yeast or barm, which induces the vinous fermentation, and resolves the saccharine matter into alcohol and carbonic acid, accompanied by a rise of temperature. The alcoholic mixture which results is called the *wash*, and is now ready for distillation. This takes place in an apparatus called a still, or alembic (q.v.). In its older and simpler form, the still consists of a copper vessel, into

which the wash is put. This vessel is provided with a close head, terminating in a bent tube, which passes, in a spiral form (the worm), through the refrigeratory, filled with cold water. See STILL. When heat is applied to the still, the spirit begins to rise in vapor at 176° , along with more or less steam; these vapors pass through the worm, become condensed by the cold, and drop or trickle in the form of liquid into a receiver. The product of this first distillation in a simple still is called *low wines*. This is then redistilled at a lower temperature, in order to deprive it of part of the water and of the fetid oils that had passed over with the alcohol. To obtain great purity and strength, repeated distillation is used.

A great improvement in distilling was invented in 1801 by a workman of Montpellier, of the name of Adam. By making the vapors arising from the still pass through a series of winding passages, maintained at a determinate degree of heat, and deposit part of their water and other impurities, he was able to obtain from wine a spirit of any required cleanness and strength *at one operation*. This principle has been adapted, by Pistorius of Berlin (1817), to the distillation of the coarser washes of grain and other materials.

Absolute or anhydrous alcohol (q.v.) cannot be obtained by distillation alone. Rectified spirit, or spirit of wine, for burning in a lamp, still contains, when of ordinary strength, about 25 per cent of water. Alcohol is considerably lighter than water, its specific gravity being 793 (water, 1000). The stronger any spirit is, then, the less will be its specific gravity; and thus the strength of spirits may be ascertained by an instrument which measures their specific gravity, the *areometer* (q.v.) or *hydrometer*. The excise of Great Britain has established one degree of strength as the legal standard, and this is called *proof*. The specific gravity of proof-spirit is 918.6, and it contains nearly equal weights of water and alcohol.

If only alcohol and water passed over in distillation, all spirits, from whatever extracted, would be the same; but this is not the case. Brandy, which is distilled from wine, has a peculiar essential oil derived from the grape, and also some acid; rum is impregnated with an essential oil from the sugar-cane, and with other impurities; malt liquor has the essential oil of barley, etc. It is these essential oils that give to the various spirits their distinguishing flavors. Some of the oils and other impurities are disagreeable and positively noxious; and it is the objects of *rectifying* to remove these. The mellowing effect of age upon spirits is owing to the evaporation or spontaneous decomposition of the essential oils. Newly distilled spirits are in general fiery, and specially unwholesome.

Sugar, when fermented, resolves itself into nearly equal weights of carbonic acid and alcohol; a pound of sugar, therefore, should yield upwards of half a pound of proof-spirit. The quantity of spirit afforded by different grains depends upon the proportion of starch they contain: 100 pounds of starch is calculated to yield 35 pounds of alcohol, equal to nearly 8 gallons of proof-spirits. Of the various grains, wheat is the most productive. Taking the average of wheat, barley, rye, oats, and maize, 100 pounds of corn yield 40 pounds of spirit of specific gravity $942 = 3.47$ gallons proof. A distiller of malt whisky, says Dr. Ure, calculates on obtaining two gallons of proof-spirits from one bushel of malt in ordinary years. The highest yield is 20 gallons per quarter of 8 bushels.

The principal intoxicating beverages produced by distillation are: 1. Brandy (q.v.), which name is applied properly only to spirits distilled from wine. 2. Rum is manufactured from molasses and other uncrystallizable products of the sugar-cane. 3. Corn or malt spirit, under the various names of British spirits, gin, whisky, etc. The Dutch distillers give a peculiar flavor to their spirits (Hollands) by adding a portion of juniper-berries to the other ingredients. From the French name of the juniper, *genièvre*, come *geneva* and *gin*. 4. Spirits from various vegetable substances. In Germany, a great quantity of spirit is distilled from potatoes, which contain about five per cent of starch. Beet-root and carrots are also used in the same way. The Swedes make a kind of spirit from the sap of the birch, and the maple and other trees are turned to a similar account. We have, besides, cherry-brandy, peach-brandy, cider-spirit, etc. 5. Arrack (q.v.) is the East Indian name for all ardent spirits. See SPIRIT.

DISTILLATION, DESTRUCTIVE, is the term applied to the process of heating vegetable and animal substances in retorts or similarly closed vessels, at a temperature sufficient to decompose the original substance, and obtain therefrom products possessing different properties from the material which yielded them. Examples of this process are, the heating of coal in gas-works at a red heat, when it resolves itself into coke, which is left in the retort, and coal-gas, naphtha, tar, etc., which distill over into suitable receivers; the treatment of coal at and below a low red heat, when it yields much paraffine oil; the distillation of wood in close vessels, at a red heat, when charcoal is left in the vessel, and wood-vinegar, wood-spirit, tar, etc., pass over in vapor, and are condensed; and the heating of bones in similar retorts, when animal charcoal is left in the retort, and Dippel's animal oil distils over.

DISTILLED WATER is the condensed product obtained by the distillation of water. All natural waters, even rain-water, contain certain saline matters (common salt, etc.) in a state of solution, from which they can only be completely freed by the process of distillation. The characters of distilled water are, that it possesses a mawkish, insipid

taste, without odor or color, and when evaporated to dryness in a vessel, it ought to leave no residue. The other properties of distilled water will be noticed under **WATER**.

DISTILLED WATERS are obtained by distilling water along with the parts of plants containing essential oils. Rose-water and lavender-water are familiar examples.

DISTINGUISHED SERVICE ORDER, an order instituted in 1886, and conferred primarily upon British naval and military officers who have been honorably mentioned in despatches. The badge is a gold cross enameled white, bearing the imperial crown on a red ground on the obverse, and the cipher V. R. I. on a red ground on the reverse, and is worn, suspended from a red riband, on the left breast.

DISTORTION. The rules of perspective impose certain conditions in the delineation of natural objects, and when the image formed by a lens on the focusing screen of a camera obscura does not fulfill those conditions, it is said to be distorted. The effect of distortion is to render all straight lines, which do not pass through the center of the lens, curvilinear, and also so to alter the relative proportions of objects in the picture as to be opposed to the principles of true perspective.

DISTRAIN. See **DISTRESS**.

DISTRESS is defined to be "the taking of a personal chattel out of the possession of the wrong-doer into the possession of the party injured, to procure a satisfaction for the wrong committed." (Stephen's *Com.*, III. 342.) It was a remedy of feudal law, inseparable from fealty to the lord, and incident to every service. Now it is practically enforced chiefly for non-payment of rent, or of certain public dues, and upon cattle straying upon land not belonging to their master. The English law of distress has been generally adopted in the United States, with some local difference. It does not seem to be very popular, however, as a means of collecting rents, as it places the landlord in a better position than the other creditors. In New England distress has given place to an attachment on *mesne profits*. In New York it is expressly abolished by statute, and in North Carolina is held to be inconsistent with the spirit of the laws and not to exist in that state. The law of Louisiana permits the landlord to follow his tenant's goods for fifteen days after removal from the premises. There are some articles, however, which cannot be distrained under the law of any of the states. For example, where the proprietor is compelled by necessity to place his goods on the land, or where he does it for commercial purposes; as, in the first instance, the goods of a traveler at an inn, or in the second, goods deposited in a warehouse on storage. Beasts of the plow, implements of trade, and similar chattels in actual use are often exempt. Goods when taken under distress are properly advertised and sold at public auction, and the overplus, if any, returned to the tenant.

DISTRIBUTIONS OF LIFE, ANIMAL AND VEGETABLE. In the light of modern discoveries, the interdependence of every part of nature is clearly revealed, and the life of the world is seen to be one symmetrical organism, the different parts of which are distributed in time and in space by the operation of laws as yet but imperfectly understood. Animals and plants, though sustaining very close relations to each other, form two distinct branches of study, whose phenomena require to be carefully discriminated. Animals are divided into terrestrial and aquatic, the first class being the most important and best understood. Their distribution is considered in two aspects—the climatical and the geographical—which present distinct and sometimes conflicting classes of facts. Of the two, the geographical conditions are the most important. The range of animals is determined in some degree by the altitude or depression of the land-surface on which they dwell. A very important element to be considered, in determining the causes of the distribution of animals, is found in their different powers of dispersal or migration, some having no means of passing over seas, or lofty mountains, or arid deserts, while others, especially the insect tribes, are not thus limited. But migrating animals can not always maintain themselves in a new region, the organisms in previous possession of the soil being too strong for them. The power of adaptation is generally inferior to the power of dispersion. The nature of the vegetation determines the range of some animals. Deserts, marshes, and forests have each their peculiar inhabitants, which do not often stray beyond their limits. Tropical forests especially supply the wants of a great number of peculiar form of life. Mountains of great height and in unbroken ranges form a barrier to the migration of many groups, but their geological age is limited, while oceans, owing to their great antiquity, have separated the faunas of different continents for countless ages. The zoological regions of the earth, according to the best authority, are six in number, each one having marked and distinct peculiarities. The last of these divisions is the Nearctic, which comprises all temperate North America, and is subdivided into the Californian, the Rocky mountain, the Alleghany, and the Canadian regions. The peculiar fauna of the Nearctic region is best represented in the United States, where many peculiar genera of mammalia, birds, reptiles, and insects are found. The distribution of the higher animals during the post-tertiary and tertiary periods is a subject of very deep interest. It is found that, during the post-tertiary period, the reindeer and the antelope inhabited France; elephants and rhinoceroses roamed all over Europe; in North America there were lions, horses, camels, bison, elephants, and mastodons. This period was characterized by great movements or migrations of the higher animals, and by the extinction of many huge creatures belonging to almost every order of mammalia,

and several orders of birds. The tertiary fauna of North America, compared with that of Europe, exhibits proof of a former communication between the two northern continents. From the knowledge now possessed of the extinct fauna of most of the great continents, scientists can approximately determine the original birthplace of some now widely distributed groups. The distribution of the marine animals also presents many interesting phenomena, but they cannot be noticed here. The geological record on which depends our knowledge of the distribution of animals in respect to time, though it reveals much important truth, is yet very imperfect. The evidence, so far as it goes, tends, it is thought, to confirm the doctrine of evolution.

The distribution of vegetable life is involved in much obscurity. For a long time the investigation of the subject was pursued under great disadvantages, and with very unsatisfactory results. The writings of Darwin, Hooker, Gray, and Bentham, however, have thrown much light on the subject. Bentham recognizes three ancient floras—the northern, the tropical, and the southern. The northern is divided into that of the old and new world by the severance of North America from Northern Asia, and by the barriers of the Rocky mountains. The divergences in the flora of these two regions originated in distance, but have been greatly increased by isolation. Lesquereux believes that the origin of the present American flora is American. There is a strong analogy, however, between it and the miocene flora of Central Europe, and the American element in the latter is supposed to be derivative, confirming the observation of Gray that plants tend to migrate from east to west, rather than from west to east. The boundaries of the northern flora, under the influence of climatic variations, have also undergone longitudinal changes. The northern flora, by the combined influence of physical and genetic causes, has undergone a specialization into three distinct groups—the Arctic-Alpine, the temperate, and the Mediterranean-Caucasian. The southern flora is still more complex in its relations, and is described in five types—the Antarctic-alpine, the Australian, the Andine, the Mexico-Californian, and the South African; the latter, though limited in extent, being the richest of all. The tropical flora has hardly as yet been investigated.

DISTRIBUTION, STATUTE OF, the distribution of the personal property of any person dying without a will by order of the court having authority. Real property is said to be acquired by descent, and goes to the heirs; personal property is distributed to the next of kin. In a large proportion of the states the rules of distribution of personal property follow the laws of descent of real estate, in others there are important distinctions. In N. Y., for example, it is provided that after the payment of debts, etc., the residue shall be distributed as follows: One-third to the widow, and the residue equally among the children. If there be no children, one-half to the widow, and the other half to be divided among the next of kin. If there be no children, parents, brothers, or sisters, then the widow takes the whole. If there be no widow, the children take the whole; if they too are wanting then the property is divided among the next of kin. The statute is very full and provides for a very large variety of contingencies, and reference should be made to it. 3 N. Y. Rev. Stat., 6th ed., p. 104.

DISTRIBUTION OF SPECIES. See SPECIES.

D'ISTRIA. See GHICA, HELENA.

DISTRICT ATTORNEY OF THE UNITED STATES, is a member of the bar appointed to try civil and criminal suits for the government in the circuit and district courts of the United States, and required by law to report his doings to the attorney-general in Washington. He has a merely nominal salary, but receives fees, often large, prescribed by act of congress. The office is one of responsibility and honor.

DISTRICT, CONGRESSIONAL, is that portion of the territory of a state the voters in which are by law entitled to choose once in two years a representative to the congress of the United States. The number of such districts varies from time to time, being fixed by congress immediately after each decennial census. (See CONGRESS, UNITED STATES.) The boundaries of the district in each state are determined by the legislature thereof. The ratio of representation (number of inhabitants required for a district) under the census of 1890 is 173,901; the number of districts is 356. The ratio is raised after each census, on account of increase of population, as otherwise congress would be inconveniently large. The time may come when a member of congress will represent a million of people. The constitution declares that each state shall have at least one representative, even if its whole population should at any time come short of the prescribed ratio. Under this rule the state of Delaware with a population of only 168,493 has one representative in the lower house of congress, while in the senate its representation is equal to that of any other state.

DISTRICT OF COLUMBIA (see WASHINGTON), a small territory between Maryland and Virginia selected in 1800 as the site for the national capital of the United States. The selection of a place for the seat of government provoked the first discussion of a sectional nature after the adoption of the federal constitution. The government was organized at New York, Mar. 4, 1789, and congress met in that city until 1791. In 1790, after a long discussion, a bill was passed providing that the seat of government should be changed to Philadelphia, where it should remain from Dec., 1790, to Dec., 1800, at which time it should be upon "a district of territory not exceeding 10 sq. m., on the

river Potomac, between the mouth of the eastern branch and Conogocheague." The land was on both sides of the Potomac, and was ceded by the owning states with the condition that congress, or the United States, should have exclusive control forever. Maryland ceded 64 sq. m., or the whole of Washington co.; and Virginia ceded 36 sq. m., which was Alexandria co.; but in 1846, the Virginia portion was returned to that state, as no part of the government establishment had been erected s. of the river. It is said that the site of Washington, or near there, was a favorite meeting-place for Indians. Among the earliest white settlers was an Englishman named Pope, who bought land and named the stream flowing through it the Tiber, and to the eminence on which the United States capitol now stands, he gave the name of Capitoline hill, calling his whole plantation Rome, and signing himself "Pope of Rome." About 60 years before the revolution, one of the ancestors of Daniel Boone owned the land now occupied by the city of Georgetown, on which he laid out a town of the same name. The first movement towards selecting a permanent seat of government was in 1783, when, through acts of mob violence, congress was forced to adjourn from Philadelphia to Princeton, New Jersey. At that time Elbridge Gerry of Massachusetts offered a resolution (adopted, but afterwards repealed) providing for the selection of a site on the Delaware, and one near the falls of the Potomac, his idea being to have a northern and southern capital. The authority to select a site was given, finally, in the federal constitution. The government title to the territory was perfected, and buildings suitable for the accommodation of congress and the executive departments were ready at the prescribed time, and on the first Monday of Dec., 1800, the capital was fixed in the federal city called Washington. For many years afterwards, Washington was but the skeleton of a town, and from its ambitious proportions was nicknamed "the city of magnificent distances," while even the poets flouted its pretension with the line, "And what was Goose Creek once is Tiber now." In 1814, the British took possession of the territory, and burned the capitol and other public buildings. Soon after that war, the District of Columbia began to improve in population and industries. When the civil war began, strong fortifications were erected for the defense of Washington, which was several times menaced or in danger, but never actually attacked.

The district of Columbia was governed directly by congress until 1871, when the people of the district were given the privileges of self-government as a regular territory; A governor and secretary were appointed, and a delegate to represent the territory in congress; also a legislature of 11 councilmen and 23 delegates, these last elected by the people annually. Two of the councilmen were required to be residents of and appointed from Georgetown, and 2 from that part of the district outside of Georgetown and Washington. In 1874 the government was placed under control of 3 commissioners appointed by the pres. and approved by the senate. The citizens have no voice in the appointments to office within the district, and have no vote in district or national affairs.

In 1896, there were in the district 5 daily and 30 weekly newspapers, 25 monthly, 2 semi-monthly, and 6 other periodicals, 68 in all. Children between 6 and 17 are within school age, and in 1895 there were 68,670 in the district; 41,557 enrolled; average attendance, 33,844; school property valued at \$3,260,027. The colleges are: Columbian university (Bap.); Gonzaga college (R. C.); National Deaf-Mute college (non-sect.); and Howard university (non-sect., though under Con. and Pres. patronage); all at Washington; Georgetown (R. C.) university. Both sexes are admitted to Howard university, and colored students are admitted to the theological department. The Baptists have also a school (Wayland seminary) in Washington; there are medical departments in nearly all the colleges, and also a National college of pharmacy. All except Gonzaga and the Deaf-Mute college have law departments. There are over 60 public libraries, with an aggregate of over 1,515,000 volumes, and more than 600,000 pamphlets. Thirty-five libraries belong to the government. Pop. '90, 230,392.

DISTRICT COURTS OF THE UNITED STATES are tribunals subordinate to the circuit courts. Each of the nine judicial circuits (corresponding to the number of justices of the supreme court) is divided into a larger or smaller number of districts. In some instances a district embraces the whole territory of a state; in others, states are divided into two or more districts. In one instance a single judge serves three, in others, two districts. With these exceptions, there is one judge for each district. When a circuit court is held within the limits of a judicial district, the district judge sits with the judge of the supreme court appointed for that circuit. See JUDICIARY IN THE UNITED STATES.

DISTRICT, SENATORIAL. A territory, the electors of which are entitled to choose a representative in the upper branch of a state legislature. The U. S. senators are chosen by the state legislatures, two for each state, without reference to population; hence the term district is in no way applicable to them.

DISTRICTS, MILITARY, are certain regions into which the United Kingdom is divided for military purposes, to facilitate command and organization. Before Mr. Cardwell's act of 1872, England was divided into four districts, and Ireland into five, while Scotland formed one. Now there are nine general districts in England—namely, the northern, with Manchester as its headquarters; the eastern, with Colchester; the southern, Portsmouth; the south-eastern, Dover; the home district, London; the Chatham; the

Woolwich; the Aldershot. In Ireland there are four—Belfast, Dublin, Cork, and the Curragh. Scotland is still one district, with Edinburgh as head-quarters. Jersey is a military district, and Guernsey and Alderney form another. See DIVISION (military).

DISVELLOPED, or **DEVELOPED**, is applied to the colors of a regiment or army, which are said, heraldically, to be disvelloped when flying.

DITCH, in agriculture, is a trench usually made along the sides of fields, so that all the drains may be led into it. A hedge is often planted along the side, and the two form a better fence for cattle. In cold, undrained lands, the earth thrown out of the trench forms a mound of dry earth, which is particularly serviceable for the growth of thorn-hedges. Accordingly, this is the common mode adopted in planting hedges in such districts, where the subsoil is often close, tenacious, and not well suited for their growth. Various forms of ditches are made; sometimes a double D. is adopted, and the hedge planted between. In arable lands, however, since the general use of small and large pipes, ditches have been converted into underground drains, which has effected a great saving of land, as well as giving to the fields a tidy appearance.

DITCH is one of the most important of the defense-works of a fortified place. It is a broad and deep trench, that may either be kept dry or filled with water; in practice, it is generally dry.

In permanent works, such as the regular fortifications of a town, the *rampart* and the *ditch* are the most important; the former being inside the latter, and formed mainly of the earth excavated from it. The D. is often 120 ft. wide, 12 ft. deep below the natural level of the ground, and 24 ft. beneath the parapet of the rampart. See **FORTIFICATION**.

DITHYRAMBUS, originally a surname of Bacchus, of uncertain derivation and meaning, was subsequently applied to a species of lyric poetry cultivated more particularly at Athens, and characterized by loftiness and vehemence of style, which, however, at a later period, degenerated into bombast and extravagance. The D. was originally a passionate hymn, sung by one or more revelers to the music of a flute; but Arion (q.v.) invented for it a regular choral or antistrophic form. It is this form which is generally spoken of as the dithyramb. It subsequently received various alterations, but no specimens of it have survived.

DITMARSH, NORTH and SOUTH (*Norder and Süder Dithmarschen*), the name given to the western district of the German duchy of Holstein, lying between the Eider and the Elbe. The entire area is 500 sq. miles. In old German times, D. formed a part of Saxony beyond the Elbe, and is worthy of special notice, because the inhabitants have preserved to the present day the peculiarities of antiquity. It has its own collection of laws, known as the *Ditmarsh Land-book*, which originated in 1321 from 48 judges; was altered in 1447, first printed in 1497, amended in 1567, and finally enjoined anew in 1711. Whatever authentic notices, traditional and otherwise, we possess of D., we owe to Joh. Adolphi (b. 1559, d. 1629), whose *Chronik des Landes D.* (Ditmarsh Chronicle), written in the Lower Saxon dialect, was published in the original text, with 23 dissertations by Dahlmann (Kiel, 1827).

DITTANY, *Dictamnus*, a genus of plants of the natural order *rutaceæ*, having a short 5-partite calyx, 5 somewhat unequal petals, 10 stamens, and 5 1 to 3-seeded follicular capsules cohering at the base. The COMMON D., also called BASTARD D., or FRAXINELLA (*D. albus*), a native of sunny mountains and rocks and dry mountain-forests of the s. of Europe, especially in calcareous soils, is very generally cultivated as a garden-flower. It is a perennial, with stem $1\frac{1}{2}$ to 3 ft. high, perfectly unbranched, bearing a few pinnated leaves, which have 3 to 5 pair of leaflets and an odd one, and terminating in a beautiful erect raceme of 10 to 20 flowers. The flowers are of a fine rose color, with darker veins, more rarely white. The plant diffuses a powerful fragrance from its numerous oil-glands when in flower, and during dry, hot weather exhales such a quantity of volatile oil that its sudden combustion makes a slight flash when a candle is brought near it on a warm summer evening. The root is thick, white, and very bitter, and was formerly in high repute in medicine as a tonic stimulant, but is now neglected.—D. of Cretæ, used as a febrifuge, is a very different plant (*Origanum dictamnus*), a kind of marjoram (q.v.).

DIT'TAY, a technical term in the criminal law of Scotland, now little used, signifying the ground of indictment or substance of the charge. By *taking up dittay* was understood the collecting of information in order to trial, which is now effected by what is called a precognition.

DITTEE'AH. See **DUTTEEAH**.

DITTON, HUMPHREY, 1675–1715; an eminent English mathematician, for some years a dissenting clergyman. The influence of Sir Isaac Newton secured for him a professorship in the new mathematical school at Christ's hospital, where he remained through life. He and Whiston published a new method for determining longitude at sea, but it was rejected by the board of admiralty. Ditton was the author of several mathematical works.

DIU, a seaport, situated at the eastern extremity of an island of the same name off the s. coast of Guzerat, in Hindustan; is well fortified, having a tolerably safe harbor, with a general depth of three or four fathoms. The anchorage, however, is said to be gradually becoming shallower. The place has been in possession of the Portuguese ever since 1515; but, from its detached and isolated position, its trade is of little consequence. The area of the island is about 62 sq. m.

DIURETICS, medicines having the property of increasing the secretion or excretion of urine, and on this account much employed in dropsies, as well as in a variety of other diseases. The principal diuretics are the salts of potash, especially the nitrate, acetate, and bitartrate (cream of tartar); squill in powder, vinegar, or sirup; digitalis or fox-glove, in powder or infusion; the decoction or infusion of broom-tops (*scoparium*): the decoction of the American winter-green or pyrola; the alcohols and ethers, with most of the volatile oils, especially that of juniper, as in gin; the berries of the common elder; the tincture of cantharides or Spanish flies; turpentine, etc. The last named (from the alcohols onwards in the above enumeration) are more or less irritating in their effects on the urinary organs, and should not be used without due consideration as to the requirements of the particular case. Cream of tartar and the broom-decoction form one of the safest and best diuretic mixtures which can be employed for domestic purposes; or cream of tartar may be given alone, either dissolved in hot water, and allowed to cool, or in substance along with sirup.

DIURNAL MOTION is the apparent daily motion of a heavenly body caused by the rotation of the earth on its axis. See **AXIS**; **EARTH**; **PLANETS**.

DIVAN is a Persian word, having various significations. It is used in the sense of a muster-roll, a register of payments or account; it is also applied to a collection of poems or songs by one and the same author. Goethe uses it in this sense in his *Westöstliche Divan*. Divan means next an administrative board; the highest council of state at Constantinople is called *Divani humâjûn*, most illustrious divan. Finally, divan is the name for the state or reception room in palaces and the private houses of the richest citizens. Along the walls of the room are ranged low sofas, covered with rich carpets, and provided with cushions. Hence the name **divan** is used for a kind of sofa.

DIVEL ON THE NECK, an instrument of torture used against the Lollards. It is thus described by Fox, in his *Acts and Monuments*: "Certain strait irons called the divel on his neck being after an horrible sort devised, straitening and winching the neck of a man with his legs together, in such sort as the more he stirreth in it, the straiter it presseth him, so that within three or four hours, it breaketh and crusheth a man's back and body in pieces."—Cowel's *Interpreter*.

DIVER, or **LOON**, *Colymbus*, a genus of birds of the family *colymbidæ* (q. v.), having a strong, straight, rather compressed pointed bill, about as long as the head; a short and rounded tail; short wings, thin compressed legs placed very far back, a *d* the toes completely webbed. They fly well, but are particularly expert in diving. They prey upon fish, which they pursue under water, making as much use of their wings as of their legs and webbed feet in their subaqueous progression. They are scarcely capable, however, of walking on land, and the name *loon* is supposed to refer to this incapacity, and to be from the same root with *lame*. The **GREAT NORTHERN D.**, or **LOON**, also called the **IMMER** or **EMBER GOOSE** (*C. glacialis*), is a bird about 2½ ft. long, exhibiting no little beauty of plumage; the upper parts black, spotted with white; the head black, with tints of green and blue; the belly white. It is a winter visitant of the British coasts, even to the furthest s., and is occasionally seen in inland districts; is found in like manner in most parts of Europe, the n. of Asia, and North America, as far s. as Texas, but it breeds chiefly in the more northern regions, as Labrador, Iceland, and Spitzbergen. It is not exclusively marine, being often seen on large rivers, and making its nest on the shores of fresh-water lakes. Its cry is very peculiar and wild, has been likened to the howl of a wolf, and is in some countries superstitiously regarded as ominous of evil. It is easily tamed, and becomes very familiar. The **BLACK-THROATED D.** (*C. Arcticus*) is another northern bird, of similarly wide geographic distribution, but much smaller size, being only about 26 in. in length. It is found at intervals distributed round the coasts of Britain, and it occasionally breeds in the fresh-water lochs of the n. of Scotland. The **RED-THROATED D.** (*C. septentrionalis*) is also found in all the northern parts of the world, is more common in Britain than either of the other species, and is the bird generally called loon on the British coasts. See *illus. DEER*, vol. IV.

DIVERGENT. See **CONVERGING**.

DIVERTIMENTO, or **DIVERTISSEMENT**, a species of musical composition consisting of different movements, arranged in an easy style for one or more instruments, but not so elaborately wrought out as the sonata, or other more regular compositions. The D. has generally no fixed character, being merely a musical picture without any attempt at artistic effect, or other aim than to please the ear, and may be said to take its place between the *etude* and the *capriccioso*. The D. was greatly in vogue during the last half of the 18th c.; until then, the word had never been used as a musical term.

DIVES is a Latin word meaning *rich* or a *rich man*. It has been incorrectly supposed to be a proper name in the story of the rich man and Lazarus in Luke xvi. The mistake is thought to have occurred from an old picture upon the subject, having the title in Latin *Dives et Lazarus*, and some illiterate person supposed the first word to be a proper name the same as the last word.

DIVIDEND, the sum apportioned to creditors from the realized assets of a bankrupt estate, and which is at the rate of so much per dollar of the claims. The half-yearly interest on the public funds, and periodical profits on shares in joint-stock undertakings, are also called the dividends, the latter being usually declared half-yearly, by order of the directors. Occasionally the dividends do not exhaust the profits, and the surplus is allowed to accumulate, until it is paid to the shareholders as an extra D. called a bonus.

DIVIDING ENGINE. See GRADUATION.

DIVIDIVI, or **LIBIDIBI**, the curved pods of *cæsalpinia coriaria* (see **CÆSALPINIA**), a tree which grows on the coasts of Curaçoa, Carthage, and other parts of tropical America. They have been long used there for tanning, but have recently acquired importance as an article of commerce. D. is one of the most astringent substances known.

DIVINATION (Lat. *divinatio*) is the act of discovering the hidden, but more particularly the future, in a supernatural way. Men have at all times set their imaginations above the causes of nature, and by a curious subjective process, have endeavored to draw out of themselves what could in reality be only derived from a study of the laws of nature. Thus, there have been instituted systems of superstition among almost all nations of the world at one period of their history, which the march of scientific discovery and the beneficent influences of a rational religion have failed to wholly eradicate, so that, even among comparatively enlightened peoples, there lurks a deep substratum of this old-world feeling. A more special use of the term is to denote fortune-telling or sorcery (middle-age Latin *sortiarius*, one who reads the future by means of lots or *sortes*). It was a maxim with the nations of antiquity, that if there are gods, they care for men; and if they care for men, they will send them signs of their will. This, with some variations, has been a universal sentiment in all ages and countries. But it was the first step in this journey which presented the whole difficulty. How was man to know the will of the gods? The variety of answers which this question has drawn forth constitutes the history of divination. Thus, among the Greeks, the word for D. was *mantikê*, which signified more than the Latin *divinatio*; inasmuch as it was applied to any means by which the Deity discloses himself to man, while the Latin word denoted more the power which man is supposed to possess of discovering the future. With the Greeks, the seer was passive; with the Romans, he was active. See **SEER** and **ORACLE**. Astrology was a favorite method of D. among the ancient Chaldeans, as well as in the middle ages. *Auguries* and *auspices*—both words derived from *avis*, a bird—were systems brought to perfection by the Romans as means of knowing the will of the gods. See **AUGURIES** and **AUSPICES**. The sacrifice of beasts, besides, the casting of the horoscope, and the observing of the constellations, were all favorite modes of guessing at the future practiced by the Romans. But the belief was not confined to the old world. The Araucanians, a warlike nation of South America, seem to have placed as implicit faith in the D. of birds as did the Romans, and they practiced this art in a way not very dissimilar. Even among ourselves, the merry-thought bone of fowls is thought to possess a curious virtue.

An extensive set of omens have been taken from observing what first happens to one, or what animal or person one meets first in the morning, or at the commencement of an undertaking—the *first-foot*, as it is called. To stumble, has been universally held to presage misfortune. Some semblance of a reason might be found for this belief, inasmuch as stumbling may be supposed to indicate that that self-possession and conscious courage, which are in themselves half a victory over circumstances, are lacking—the want of them, therefore, being half a defeat; but in most cases the interpretation seems altogether arbitrary. The dread of a hare crossing the path seems to be widely prevalent; while to see a wolf is a good omen. This feeling is probably a remnant of warlike times, when the timid hare suggested thoughts of cowardice and flight; while the bold wolf, sacred to Odin, was emblematic of victory. The character of the hare for being unlucky is also connected with the deep-rooted belief, that witches are in the habit of transforming themselves into hares. That to meet an old woman is unlucky, is another very general belief; arising, without doubt, from the same causes that lead to their being considered witches. In some places, women in general are unlucky as *first-foot*, with the singular exception of women of bad reputation. This belief prevailed as far back as the age of Chrysostom. Priests, too, are ominous of evil. If hunters of old met a priest or friar, they coupled up their hounds, and went home in despair of any further sport that day. This superstition seems to have died out, except in the case of sailors, who still consider the clergy a "kittle cargo," as a Scotch skipper expressed it, and anticipate a storm or mischance when they have a black-coat on board. This seems as old as the days of the prophet Jonah.

The observation of *lucky* and *unlucky* days was once an important matter, and was often the turning-point of great events. It is now confined to the one subject of mar-

riage. In fixing the wedding-day, May among months, and Friday among days, are shunned by many people both in the higher and lower orders; for in this matter, which is the exclusive province of women, and in which sentiment and fancy are in every way so much more active than reason, the educated and uneducated are reduced to a level. Perhaps half the superstitious beliefs that yet survive among civilized and Christian communities, group themselves round the subject of love and marriage—of such intense interest to all, yet so mysterious in its origin, and problematical in its issue. The liking or passion for one individual rather than any other, is so unaccountable, that the god of love has been fabled blind; it is of the nature of fascination, magic, spell. And then, whether happiness or the reverse shall be the result, seems beyond the reach of ordinary calculation. All is apparently given over to mystery, chance, fortune, and any circumstances may, for what we know, influence or indicate what fortune's wheel shall bring round. Hence the innumerable ways of prognosticating which of two or more persons shall be first married, who or what manner of person shall be the future husband or wife, the number of children, etc.

Sneezing, likewise, has long been looked upon as supernatural, for this reason, that it is sudden, unaccountable, uncontrollable, and therefore ominous. The person is considered as possessed for the time, and a form of exorcism is used. A nurse would not think she had done her duty if, when her charge sneezes, she did not say: "Bless the child," just as the Greeks, more than two thousand years ago, said: "Zeus protect thee."

One general remark, however, it is important to make in regard to omens. An *omen* is not conceived to be a mere sign of what is destined to be; it is conceived as causing in some mysterious way the event it forebodes; and the consequence, it is thought, may be prevented by some counteracting charm. Thus the spilling of salt not only forebodes strife, but strife is conceived as the consequence of the spilling of the salt, and may be hindered by taking up the spilled salt and throwing it over the left shoulder.

An important exercise of the diviner's art is to determine the innocence or guilt of parties. This will be treated under ORDEAL. But it would be impossible to enumerate the endless modes of D. for which learned names have been found. Some of the principal are *axinomancy* (q.v.), *belomancy*, *bibliomancy* (q.v.), *botanomancy*, or D. by means of plants and flowers (it was practiced by the ancients, who were wont to bruise poppy-flowers betwixt their hands, under the conviction that they could thereby discover their loves. Hence Theocritus calls the poppy *teliphilos*, quasi *deliphilos*; i.e., a tell-love. Goethe has made a beautiful use of another form of this superstition, which existed among the Teutonic races no less than among the old Greeks. The child-like Marguerite, in *Faust*, seeks to discover whether or not Faust loves her by plucking the leaves from a star-flower, murmuring alternately, "He loves me," "He loves me not," and finds to her joy that the last leaf comes away while she is saying "He loves me"); *capnomancy* (q.v.), *cheiromancy* (q.v.), *coscinomancy* (q.v.), *crystallomancy* (q.v.), *cup*, *divination* by (q.v.); *geomancy* (this was anciently practiced by casting pebbles on the ground, from which conjectures were formed; but the Arabian geomancy was more recondite, being founded on the effects of motion under the crust of the earth, the chinks thus produced, and the noises or thundering heard); *hydromancy*, D. by water or by a mirror, in which the diviner shows the image of an absent person, what he is doing, etc. (this mode of D. plays an important part in the Arabian romances); *lithomancy*, a species of D. performed by stones, but in what manner it is difficult to ascertain; *oneiromancy* (see DREAMING); *pyromancy*, or D. by flame (it was common among the Greeks and Romans: if the flame of the sacrifice was vigorous and quickly consumed the victim, if it was clear of all smoke, and did not crackle, but burn silently in a pyramidal form, the omen was favorable; otherwise, it was not); *rabdomancy* (see DIVIN-NG-ROD); and *teraphim* (q.v.). See SUPERSTITION.

DIVINE COMEDY. See DANTE.

DIVINE RIGHT. A term applied to describe the source of the power claimed for the monarch, by the royalist party, in the great controversies between the monarchical and the parliamentary or commonwealth parties in England in the 17th century. The monarch was held to be the immediate representative of the Deity, to whom alone he was responsible for all his actions—a principle which, of course, relieved him from all human responsibility. The idea was little known in that country until the quiet transfer of the crown from the Tudor to the Stewart dynasty showed that the hereditary principle was firmly established. It was found by some ecclesiastics in the doctrine of the civil law, which, in imitation of the practice of oriental nations, flattered the Roman emperors by attributing to them a power founded on divine institutions. Throughout a long and miserable contention, D. R. was on the one side maintained to be the source of political power, while on the other it was maintained that that power emanated from the will of the people, expressed in what was called "the social contract." The chief writers on the side of D. R. were Salmasius and sir Robert Filmer; on the other, Milton, Algernon Sydney, and Harrington. The controversy revived in the discussions which caused the French revolution, long after the settlement of the crown on William and Mary and the Hanover dynasty had settled it in Britain.

DIVING APPARATUS, DOCKS, ETC.—1. Steam-dredge. 2. Tow-boats. 3. Diving-bell. 4. 5. 6. 7. 8. Shoe; 9. Knife, of diving apparatus. 10. Tidal-dock. 11-19. Perspective and

. Diver with Denarouse's apparatus. 5. Dry-dock (Toulon). 6. Helmet; 7. Knapsack; 9. Dagger; 20. Anchor. 21. Iron screw. 22. Handscrew.

DIVINE SERVICE, a tenure by which the tenant was bound to do some special divine service, as to sing so many masses, to distribute a certain sum in alms, or the like. It differed from frankalmoigne (q.v.) in this, that the lord could distrain for the former, not for the latter, which, being an indefinite service, could be enforced only by a complaint to the ordinary or visitor.

DIVING. The "treasures of the deep" have at all times been the subject of much visionary exaggeration, and the accounts of the exploits of divers equally extravagant. We could name a popular school-book, still in extensive use, where children are seriously informed that the pearl-divers of the east acquire by practice the power of remaining under water from 15 to 20 minutes. Such statements are common enough in narratives of ancient date, in some of which the time is extended to two hours. It need scarcely be said that these accounts are absurd, no such endurance being possible. The more skillful divers may remain under water for two, or even three minutes; some modern accounts say four, and even six, but this is very doubtful. In a swimming and diving contest between some North American Indians and Englishmen in a London swimming-bath, one of the Indians, a renowned swimmer and diver, remained under water just one minute and a half, but a London artisan beat him by a few seconds.

In the *Encyclopædia Britannica*, Prof. Faraday describes an interesting fact to which his attention was directed by a gentleman connected with the Asiatic society, who, according to Prof. Faraday, was the first to make the observation. It was observed that by breathing hard for a short time, as a person does after violent exercise, the breath could then be held much longer than otherwise. Prof. Faraday found that he could only hold breath for three quarters of a minute, if he attempted it without preparation, but that after eight or ten of such forced inspirations, he could hold breath for two minutes. This he explained on the supposition that, ordinarily, a considerable quantity of carbonic acid remains in the involved passage of the lungs, but that it becomes completely expelled by the forced breathing, and its place supplied by atmospheric air. As regards the novelty of the observation, Prof. Faraday was mistaken, as the writer of this can testify, for when a boy, he and his companion bathers in the Serpentine, in Hyde Park, commonly practiced it. The Red Indian and the artisan above referred to also did the same; it is, in fact, a sort of preparation that a practiced diver would make almost instinctively. After a few deep inspirations of this kind, a sense of giddiness is felt, and it is not prudent to carry the experiment far beyond this stage, as a fit of insensibility not unlike apoplexy is apt to result.

This giddiness, which is always produced, and the possible insensibility, indicate a different explanation from that of Faraday. The mere removal of residual carbonic acid from the lungs is not sufficient to explain these; we should rather suggest that all the phenomena result from an excessive oxygenation of the blood, and a consequently accelerated circulation similar to that produced by breathing nitrous oxide. It will be easily understood, that if the blood be forced to take an excess of oxygen, a longer time should elapse before a fresh supply would become necessary—that is, before suffocation would take place; and the giddiness, flushing of the face, and the insensibility, are results to be expected from such an excess.

Most divers suffer severely from the continual efforts in holding the breath; blood-shot eyes and spitting of blood are common among them. This rude mode of diving is now but little used except for pearl and sponge fishing; and even for these purposes, only an uncivilized people, with very little capital and knowledge, would continue to use it, as the modern applications of science afford such immense advantages for all kinds of subaqueous operations, as will be seen by the next article.

DIVING-BELL. From what has been stated in the preceding article **DIVING**, it will be at once understood that for all such purposes as subaqueous works upon the foundations of piers, bridges, etc., or the exploration and raising of sunken vessels, the efforts of the unaided diver would be almost valueless, and accordingly various contrivances for supplying air to the diver have been made. The *cacabus aquaticus*, or aquatic kettle, described by Taisnier as having been used by two Greeks in Spain, at Toledo, in 1538, in the presence of the emperor Charles V. and a multitude of spectators, is one of the earliest reliable accounts of a diving-bell. From his description, this must have been similar in principle and construction to the modern diving-bell, but of clumsy dimensions, and wanting in efficient means of renewing the supply of air. Dr. Halley's diving-bell, about 1720, was a wooden chamber of about 60 ft. internal capacity, open at the bottom, where it was loaded with lead to keep it perpendicular in its descent. Strong pieces of glass were set in the upper part to admit light. Casks filled with air, and loaded with lead, were let down with the bung-hole downwards; and from these a supply of air was drawn by means of a hose. The form of diving-bell now in use was first constructed by Smeaton for the works at Ramsgate harbor, 1788. It was of cast-iron, and weighed 50 cwt.; its height, $4\frac{1}{2}$ ft; length, the same; and width, 3 feet. It sunk by its own weight, and was lighted by stout pieces of bull's-eye glass firmly cemented by brass rings near the top. The principle of the diving-bell will be easily understood by floating a piece of lighted candle or a wax-match on a cork, and then covering it with an inverted tumbler, and pressing downwards; the candle will descend below the level of the surrounding water, and continue burning for a short time, although the tum-

bler be entirely immersed. The reason is obvious enough: the air in the tumbler having no vent, remains in it, and prevents the water from occupying its place, so that the cork and candle, though apparently under water, are still floating, and surrounded by the air in the tumbler; the candle continues burning until the oxygen of the air is exhausted, and then it goes out, as would the life of a man under similar circumstances. If vessels full of air, like the barrels of Dr. Halley, were submerged, and their contents poured into the tumbler, the light might be maintained; but this could be better done if a tube passed through the tumbler, and air were pumped from above through the tube into the tumbler.

The modern diving-bell, which is made of cast-iron like Smeaton's, is supplied with air in this manner. It must be remembered that air is compressible, and diminishes in bulk in proportion to the pressure, so that at a depth of about 33 ft. in water, it would occupy half the space it filled at the surface; if the inverted tumbler were carried to this depth, it would be half filled with water. A considerable quantity of air has, therefore, to be pumped into the diving-bell, merely to keep it full as it descends; the air thus compressed exerts a corresponding pressure, and would rush up with great force if the tube were open and free. This is prevented by a valve opening downwards only. When the diving-bell has reached its full depth, the pumping is continued to supply air for respiration; and the redundant air overflows, or rather *underflows*, by the open mouth, and ascends to the surface in great bubbles. The diving-bell is provided with a platform or seat for the workmen, and suspended from a suitable crane or beams projecting from a barge or pier; men above are stationed to work the pumps, and attend to the signals of the bellman. These signals are simply made by striking the sides of the iron diving-bell with a hammer, and as sound is so freely communicated through water, they are easily heard above. One blow signifies "more air;" two blows, "stand fast;" three, "heave up;" four, "lower down;" five, "to eastward;" six, "to westward," etc. These, of course, may be modified as agreed upon. Messages are also sent up, written on a label attached to a cord. The sensations produced in descending are rather curious. Immediately on the mouth of the diving-bell striking the water, a feeling like a slight blow on the internal ear is produced; a dull ringing in the ears and a sense of deafness follow.

The workmen accustomed to subaqueous existence do not suffer these inconveniences; novices feel pains in the head and ears, but these pass away after a short initiation. It is stated that one man who had suffered from difficulty of breathing was completely cured by "belling," and that deafness is not produced by it, but, on the contrary, is in some cases relieved.

DIVING-DRESS. In Schott's *Technica Curiosa*, published in 1664, is described a *lorica aquatica*, or aquatic armor, which consisted of a leathern dress, to protect the diver from the water, and a helmet. In 1721, Halley describes a contrivance of his own of nearly the same kind; its object was to enable the diver to go out from the bell and walk about; he was to be provided with a waterproof-dress, and a small diving-bell, with glass front, as a helmet over his head, which was to be supplied with air by means of a tube from the diving-bell.

In 1798 Kleingert of Breslau invented a diving-dress available for depths up to 20 feet. The head and body of the diver were encased in cylindrical tin-plate armor, and his legs, in leather breeches. Fresh air was conveyed to him and the vitiated air was removed by means of pipes. In 1829 August Siebe devised an open helmet diving-dress, having a copper helmet and breastplate, with attached canvas jacket, below which the air was allowed to escape, but to avoid the admission of water the diver was forced to keep a vertical position. In 1839 Siebe improved his dress, which now is a waterproof costume with helmet of tinned copper, having circular glasses in front, valves to admit and discharge air, and a signal line to allow communication with those above water. The weight of the dress is about 275 lbs. In 1880 Fleuss invented a dress weighing only 20 lbs. This has a copper cylinder fastened to the back, carrying a supply of compressed oxygen. The carbonic acid exhaled by the diver is absorbed by caustic soda in a receptacle fixed above the copper cylinder, while the nitrogen is breathed over and over again. In this dress the diver may remain several hours below the surface. For lighting, arc and incandescent lights are used, as well as improved oil-lamps supplied with air by force-pumps. Slates and signal lines are used for purposes of communication. According to Siebe the greatest depth to which a man has ever descended is 204 feet; equivalent to a pressure of 88½ lbs. per square inch.

DIVINING-ROD—often called the *virgula divina*, the *baculus divinatorius*, the caduceus or wand of Mercury, the rod of Aaron, etc.—is a forked branch, usually of hazel, and sometimes of iron, and even of brass and copper, by which it has been pretended that minerals and water have been discovered beneath the surface of the earth. The rod, when suspended by the two prongs, sometimes between the balls of the thumbs, will distinctly indicate, by a decided inclination, it is alleged, the spot over which the concealed mine or spring is situated. Other powers are ascribed to the divining-rod, but this is the chief. Many men, even of some pretensions to scientific knowledge, have been believers in the occult power ascribed to this magic wand. Agricola, Spellingius, and Kirchmayer, all believed in its supernatural influence. So did Richelet the author of

the dictionary. The learned Morhoff remained in suspense, while Thouvenot and Pryce, in the latter part of the 18th c., gave ample records of its supposed power. Bayle, in his dictionary, under the word *abaris*, gives some ingenious arguments both for and against the divining-rod. In a work published by Dr. Herbert Mayo in 1847 and 1851, entitled *On the Truth Contained in Popular Superstitions*, he gave some curious illustrations of the art, supposed to be possessed by one in forty of the Cornish miners. At Weilbach, in Nassau, he likewise met with one Edward Seebold, who, he says, possessed the power, but afterwards lost it. Arthur Phippen, in 1853, published a pamphlet containing an account of two professional diviners or dowzers. One of them, named Adams, gave remarkable indications of being able to detect water under-ground. He not only was able to discover the particular spot where water might be found—he could even perceive a whole line of water running under-ground.

Scientific men, who have bestowed any care on the examination of nature, regard this alleged power of the divining-rod as an unconscious delusion, ascribing the whole phenomenon to the effect of a strong impression on the mind acting through the agency of the nerves and muscles. See ANIMAL MAGNETISM.

DIVIRIGI (anc. *Tephrene*), a t. of the province of Sivas, Asia Minor, on the Kurner-Su, a branch of the Euphrates, 28 m. n.w from Arabkir. Pop. supposed to be about 5600.

DIVISIBILITY is that property of quantity, matter, or extension, through which it is either actually or potentially separable into parts. Whether matter is or is not indefinitely divisible, is a question which has occupied the minds of philosophers since very early times. See ATOM. There is no doubt that, abstractly speaking, it is indefinitely divisible. We cannot conceive any body or space so small but that we can subdivide it in imagination, and thus figure to ourselves bodies and spaces still smaller; and practically, we know that the subdivision of matter is carried in nature far beyond appreciation either by our senses or by calculation. The diffusion of odors through the air for long periods from odoriferous bodies without their suffering any sensible change of weight, and the tinging of great quantities of fluid by very minute portions of coloring matter, are cases commonly appealed to in proof of the extreme fineness of certain material particles; while, by experiment, it is shown that there is no practical limit to the divisibility of even the most solid substances. Thus, an ounce-weight of silver, gilt over with eight grains of gold, has been drawn out into a wire 13,000 ft. long, which was all its length covered with the gold; and a tube of glass presented to the blow-pipe has been drawn out till it became as fine as a silk fiber, or $\frac{1}{35000}$ th of an inch thick, still retaining its character as a tube with a distinct interior and exterior surface. In fact, in theory, great and small are mere terms of relation; under the microscope, objects invisible to the eye appear of considerable bulk; and as sir John Herschel, in his celebrated *Introduction to the Study of the Physical Sciences*, has put it, there is no reason why a mote in a sunbeam should not be in itself a world. With regard to the indefinite divisibility of space, it may be demonstrated geometrically; and perhaps, after all, it is the feeling that space is infinitely divisible, which compels our minds most strongly to resist the notion of ultimate atoms with definite forms, as conceived in the corpuscular theory.

DIVISIBILITY, in the theory of numbers, means the capability of any number of being divided by another without remainder. To find the condition of divisibility of one number, N , by another, D . Let $N = b_m r^m + b_{m-1} r^{m-1} + \dots + b_1 r + b_0$. See NOTATION. Then $N = b_m (D + (r-D))^m + b_{m-1} (D + (r-D))^{m-1} + \dots + b_1 (D + (r-D)) + b_0$. Expanding the different terms of the right-hand side of this equation, it will appear that $\frac{N}{D}$ will be a whole number, if $b_0 + b_1 (r-D) + \dots + b_m (r-D)^m$ be divisible by D . Hence, if $r = 10$, or the number be in the denary scale, and $D = 9$, and therefore $(r-D) = 1$, any number will be divisible by 9, if $b_0 + b_1 + b_2 + \dots + b_m$ is so, or if the sum of its digits is divisible by 9.

DIVISION, one of the four principal rules of arithmetic, is that by which we find how often one quantity is contained in another. It is a compendious method of subtraction, by which we can at once take one number from another as often as it is contained in it. There are three numbers concerned in D .: the dividend, or number to be divided; the divisor, or that by which the dividend is to be divided; and the quotient, or the number expressing how often the divisor is contained in the dividend. The symbols of D . are $b) a$ ($\frac{a}{b}$), or $a \div b$, where a is the dividend, and b the divisor.

There are various methods of D ., such as the English, Flemish, Italian, Spanish, German, and Indian methods, which differ merely in the manner of arranging and disposing the numbers. The English method will be found explained in all the ordinary text-books of arithmetic. There are also rules of D . for the D . of integers, fractions, and algebraical quantities. The general rule for the D . of vulgar fractions is to multiply the one by the reciprocal of the other. The D . of decimal fractions is performed in the same way as the D . of integers. And, in algebra, D . is practically performed as in arithmetic, either by making a fraction of the dividend and divisor, and reducing the numerator and denominator by the parts common to both, or else by dividing the former by the latter, after the manner of long division. See LOGARITHMS.

DIVISION, a definite part of an army or of a fleet, consisting in the army of a certain number of brigades with cavalry and artillery and commanded by a major-general. In tactics the uniting of two companies in regimental or battalion drills forms a division. Military geographical divisions and departments are established and their commanders assigned by direction of the President. In time of peace army corps, divisions, or brigades are not formed. A division commander supervises the affairs of the departments composing his division as a general commanding in the field does those of his subordinate commanders. For convenience and to fix responsibility, the United States had till 1891 three military divisions. The division of the Atlantic, including the department of the East, with headquarters on Governor's Island, New York harbor. Division of the Missouri, subdivided into the departments of Missouri, Dakota, Texas, and the Platte, with headquarters at Chicago. Division of the Pacific, including the departments of California, Columbia, and Arizona, with headquarters at San Francisco.

In 1897 the military commands comprised eight departments. A naval division is the subdivision of a fleet or squadron, the commander of which flies a pennant to especially designate his division. A portion of a ship's company set apart for a certain service in action is also called a division. Those who serve at the guns are classed as the first, second, third divisions, the powder divisions serve the battery with ammunition; the navigator's division steer the ship, trim the yards, look after the signals and soundings; the engineer's division attend to everything in the engine department; the medical and paymaster's divisions have charge of what pertains to those two departments.

DIVISION OF LABOR, or **DIVISION OF EMPLOYMENT**, a term often used by political economists to express a means by which labor is economized, or, as another method of stating the same result, by which production is increased. The problem in division of labor is so to adjust matters in any given community that each member of it shall work, or be able if he pleases to work, with the greatest possible results. In practice it is, like most other arrangements, apt to be too broad or too narrow. The old term, "jack of all trades and master of none," expresses the truth, that people who try too many things are not likely to be adepts in any. On the other hand, few people can do any sort of work to great perfection, unless it is part, as it were, of a group of functions for which they are more or less prepared. A good dentist will be in some measure a surgeon; a conveyancer or a special pleader will know something of the other departments of legal practice; a shipwright will be able, on occasion, to do other kinds of carpentry, and he will be the better of a general knowledge of the mechanical powers. That division of labor, in fact, which is really productive, is where a man who can do several things selects one as that which he can do best, or has most opportunity of doing. By constant practice at that one thing, and the withdrawal of his attention from other matters, he achieves perfection and rapidity of execution. There is an important difference between this selection of a special pursuit, and the inability to do anything more than one thing, which is often confounded with it. In the former case, the worker, whether with head or hand, has great resources, for his adopted pursuit is the best out of several others, on which he can fall back. The man who can do only one thing is in a precarious condition, because that one thing may be superseded. Indeed, as the one thing which can be so done is generally a very simple thing, it is almost a law in political economy that it will come to be superseded by machinery. Such was the fate of the hand-loom weavers, whose function, especially in the plainer and lighter fabrics, was too easy to last. Of the division of unskilled and easy labor, there is an excellent illustration in Adam Smith's description of pin-making: "One man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business; to whiten the pin is another; it is even a trade by itself to put them into a paper; and the important business of making a pin is in this manner divided into above eighteen distinct operations, which in some manufactories are all performed by distinct hands." This division was doubtless useful, so long as pins were made entirely by human hands. It prompted serious inquiries, however, how far such functions were of an improving or a deteriorating character, and essays were written to prove that in manufacturing countries human beings were deteriorating, as no one of them had the faculty of self-support in separation from his fellows, and none could even make one single article by himself, all being dependent for their bread on a complex co-operation, which might break down any day. The answer to such fears may be found in the pin-making of the present day, where one man tends a machine, feeding it with wire at one end, while the pins drop out at the other. This, too, is the fruit of division of labor, for many skillful heads and hands have been occupied in bringing to perfection the different parts of the machinery. It is of the highest importance to the working-classes of a country, to keep in view that though the division of labor does sometimes create functions which, while they are extremely simple and easy, are of value as helping other functions to go on, yet this kind of easy and uniform work has no stability in it, and the possession of the facility for doing it acquired by practice is no permanent industrial endowment, since it is pretty sure to be superseded by machinery.

DIVISOR. See **DIVISION**. See also **NUMBERS**, **THEORY OF**.

DIVORCE is the dissolution of marriage by the act of the law on due cause shown. The desire to obtain a release from the matrimonial bond has existed at all times and under all legal systems. In heathen nations this release was often granted on the slightest grounds. Even among the Romans, marriage was regarded as little more than a conventional union, to be observed so long only as it suited the mutual convenience of the spouses. Christian nations, on the other hand, adopting as the basis of their systems the scriptural law as declared in Matt. xix. 9, Mark x. 9-11, Luke xvi. 18, and 1st Cor. vii. 10, 11, are agreed in considering marriage a sacred tie, not to be dissolved except on the ground of unfaithfulness to the marriage vow. Even this limited ground for dissolution of marriage is denied by a large portion of the Christian world. By the civil law, as it existed for some centuries after Christianity, a greater laxity was allowed in regard to divorce. The emperor Constantine was the first to prohibit dissolution of marriage by simple consent of the parties. This practice was again revived under the emperors Theodosius and Valentinian; and though those emperors subsequently rescinded this edict, yet the rule as to the grounds on which marriage might be dissolved continued to fluctuate. The law as substantially adopted by Justinian assigned the following justifiable causes for divorce on the part of the wife: certain high crimes, including murder, treason, poisoning, attempts upon the life of the wife, intimacy with prostitutes, and adultery; on the part of the husband the same, with the addition of passing the night out of his house, and visiting places of amusement without his consent. By the canon law, marriage was regarded as a sacrament; and though marriage contracted in disobedience to certain rules might be declared null *ab initio*, a marriage validly contracted would not be dissolved except by papal dispensation. But the rule of the canon law was not uniformly adopted by the states of Europe, and it was not till the famous council of Trent issued a decree in its 24th session, in 1562, declaring marriage indissoluble even after the adultery of one or both of the parties, that a uniform rule on the subject was established. But before this decree was issued, the reformation had made progress throughout Europe, and thus a change again took place in regard to the law of divorce. It should be observed that, though by the canon law divorce *a vinculo matrimonii* was unattainable, parties might obtain a separation *a mensâ et thoro*. Roman Catholic countries adopted the principle laid down by the council of Trent, and this rule continues to be in force in most countries which are in the Roman Catholic communion. In Protestant countries, on the other hand, it may be generally stated that the liberality with which divorces have been granted has steadily increased. Luther and Calvin admitted divorce for adultery and malicious desertion. The former crime they thought worthy of the death penalty, but they did not think it wise to prohibit the marriage of the divorced adulterer, since the civil law did not take this view of the offense. The laws of Prussia on the subject of divorce are perhaps more liberal than those of any other nation of the reformed faith. Divorce is there permitted for adultery, sodomy and other unnatural vices, malicious desertion, persistent refusal of marital intercourse, plots or practices endangering life or health, ungovernable temper, drunkenness, extravagance, etc., unless convicted after the admonition of the judge; failure of the husband to support the wife, hopeless insanity continuing for more than a year, and, where there are no children, deliberate mutual consent. In Holland and in Scotland divorce may be obtained on the ground of ill-usage, and perhaps desertion (q.v.). Condonation and collusion, but not recrimination, are, in Scotland, a bar to obtaining a dissolution of marriage on the ground of adultery. In France the canon law prevailed until the French revolution brought about a change in the rules relating to marriage, and a short period followed in which freedom of divorce was established. By the civil code (1803) both absolute divorce and judicial separation were granted. The former could be obtained on the ground of adultery, but when the wife was petitioner it must be shown that the husband had kept his concubine in the conjugal residence. Divorce was granted to either party for any outrage, gross cruelty, or grievous injury inflicted upon him or her by the other, or for condemnation of the other to infamous punishment. Mutual consent, subject to careful restrictions as to age, consent of the relatives, duration of marriage, protection of children, etc., was also sufficient ground for divorce. Neither party could marry within three years after the divorce was granted. In 1816, as a consequence of the religious reaction, the sacramental theory as to the nature of marriage regained the ascendancy, and the laws relating to divorce were repealed, but judicial separation was retained in the new system. Efforts were made in 1831 and 1832 to renew the previous divorce laws, but failed. In 1881, M. Naquet made an unsuccessful attempt in the chamber of deputies to procure the repeal of the law of 1816; the majority stood firm against the legalization of divorce. But in the session of 1883 the Naquet bill was finally passed, the law of 1816 was repealed by a large majority, and divorce was granted for causes of adultery, conviction of crime, cruelty, and on other grounds. In England, previous to the passing of the act of 1857, establishing the divorce and matrimonial court-marriage was, by the common law, indissoluble. It was, indeed, competent to obtain a declaration of nullity of marriage on the ground of relationship, previous marriage of one of the parties, mental or physical incapacity, coercion, or fraudulent representations as to the essentials of the relation, as, for example, false impersonation. But the judgment so obtained was not a decree of divorce, but a declaration that the marriage tie between the parties had never really been contracted. Dissolution of marriage even on these

grounds is subject to many limitations, as in the case of alleged fraud or coercion, voluntary cohabitation of husband and wife is a bar to divorce; and where parties have married under the age of consent, if such cohabitation continues after they have reached their majority, divorce cannot be obtained on the ground of their minority. A wife may now obtain a divorce on the ground of the husband's incestuous adultery; or of his bigamy with adultery; or of rape; or of sodomy; or of adultery coupled with gross cruelty; or of adultery coupled with desertion without reasonable excuse for two years. The husband may obtain a divorce on the ground of the wife's adultery. But neither party can obtain a divorce on the ground of desertion alone, however long continued. Nor will a divorce be granted should it appear that husband or wife has been guilty of recrimination by committing the same offense, or that there is collusion between them in order to procure the divorce. Parties also who have condoned the offense—that is, who after it has been discovered have consented again to live together as husband and wife—will not be allowed to obtain a divorce. In order to guard against fraud by parties conniving to procure a divorce, power is given to the queen's proctor, by 23 and 24 Vict., c. 144, to interpose, in case he have reasonable ground to suspect collusion or recrimination, in order to oppose a petition for divorce. The court may order the husband to pay a divorced wife a certain sum for her maintenance during their joint lives. After decree of divorce, the offending party may marry again, even with the paramour. But it is enacted, 20 and 21 Vict., c. 85, that no clergyman shall be compelled to solemnize the marriage of any person who has been divorced. He must, however, allow another clergyman, if willing to do so, to perform the marriage. By the acts of 1857 and succeeding years, parties are also entitled to obtain a judicial separation on the ground of adultery, cruelty, or desertion. Judicial separation is declared to be in place of a separation *a mensâ et thoro*. A married woman, having obtained decree of judicial separation, is declared to be in all respects as a *femme sole* in regard to any property that she has or may acquire. Even before obtaining a separation, a woman deserted by her husband may obtain from the court a protection for any property she may acquire by her own industry. When the divorce is on the ground of adultery, both parties may be examined as witnesses. In the United States, during the colonial period, the legislative bodies in the several states gradually assumed the right of granting divorce, and after the revolution the system of divorce by legislative enactment became uniformly established. Experience of this system proving its defective character, the jurisdiction over divorce cases was generally transferred to the courts of equity, and in many of the state constitutions it was distinctly provided that divorce by legislative act should not be permitted. There is no national control over divorce legislation in this country, and, as the states are left to make their own laws regulating the dissolution of marriage, the greatest diversity in their treatment of the subject has arisen and offers a very serious objection to our system, since it is comparatively easy for a party to move from one state to another and procure a divorce on grounds invalid in the state from which he came, and often without the knowledge of other parties intimately concerned. This want of uniformity makes it impossible to lay down general principles as to the grounds on which divorce is granted in the United States as a whole, and a brief outline of the laws relating to the subject in the different states is all that will be attempted in the present article. There are laws granting divorce on certain specified grounds in all the commonwealths except New Mexico and South Carolina. In the latter state divorce is not granted on any grounds whatever, either by courts of justice or by legislative acts, and the results of this state of things offer an interesting subject for investigation to those who maintain the strict canonical view with regard to the indissoluble nature of marriage. It has been remarked that the prevalence and partial legal recognition of concubinage are the effects of this attitude toward the divorce question in South Carolina. (Bishop's *Marriage and Divorce*.) In all the states infidelity and violation of the marriage vow are recognized as valid grounds for divorce. In New York, adultery alone warrants absolute divorce in the eye of the law. Impotence or physical inability in almost all either justifies divorce or renders the marriage voidable. Willful desertion is generally considered a sufficient cause, but the period of absence necessary to substantiate the complaint varies in the different states from one to three years; and in Rhode Island and Virginia, five years must have expired. Other grounds are the following: Habitual drunkenness in all states and territories except Maryland, New Jersey, North Carolina, Pennsylvania, Texas, Vermont, Virginia, and West Virginia. Imprisonment for or conviction of felony, cruel and abusive or inhuman treatment, intolerable, extreme, or repeated cruelty, in most of the states. Failure of the husband to provide for the wife, in California, Colorado, North Dakota, South Dakota, Nevada, Wyoming, Indiana, Idaho, Arizona, Massachusetts, Michigan, Maine, Nebraska, Rhode Island, Vermont, Wisconsin; willful neglect for three years, in Delaware. Fraud and fraudulent contract, in Arizona, Connecticut, Georgia, Idaho, Kansas, Kentucky, Ohio, Pennsylvania, and Washington. Absence without being heard from for three years, in New Hampshire; for seven years, in Connecticut and Vermont; separation for five years, in Kentucky; voluntary separation for five years, in Wisconsin. Reasonable presumption of death by the court, in Rhode Island. Ungovernable temper, in Kentucky; habitual indulgence in violent and ungovernable temper, in Florida; cruel treatment, outrages, or excesses, such as render living together intolerable, in Arkansas, Kentucky, Louisiana, Missouri,

Tennessee, and Texas; such indignities as to render life burdensome, in Missouri, Oregon, Pennsylvania, Tennessee, Washington, and Wyoming; notorious immorality of the husband before marriage, unknown to the wife, in West Virginia; fugitive from justice, in Virginia; gross misbehavior or wickedness, in Rhode Island; gross neglect of duty, in Kansas and Ohio; attempt on life, in Illinois; refusal of the wife to move into the state, in Tennessee; mental incapacity at the time of marriage, in Georgia; three years with any religious sect that believes the marriage relation unlawful, in Massachusetts; joining such a sect and refusing to cohabit for six months, in New Hampshire; inability to live in peace and union, in Utah; settled aversion tending to destroy all peace and happiness, in Kentucky. Absolute divorce is granted on these grounds; but condonation, or collusion, or connivance, with the purpose of procuring a divorce is in all states regarded as a bar to the dissolution of marriage. In Georgia, divorce is only granted after the same verdict has been reached by two juries at different terms of the court. In Connecticut, Illinois, Kentucky, and Missouri, the divorced parties may remarry without restriction. In Massachusetts, either party may remarry, but the defendant must wait two years and get the permission of the court. In Virginia a decree of the court may restrain the guilty party from marrying again; and in Maine the parties cannot marry till after two years without the court's permission. In New York, the plaintiff may remarry, but the defendant is not permitted to do so in the former's life-time except by the express permission of the court, or if, after five years have passed, the plaintiff has remarried, and the defendant's conduct has been uniformly good during the interval. Violation of this rule is punished as bigamy, even when the other party has remarried. In Delaware, Pennsylvania, and Tennessee, the party divorced for infidelity to the marriage vow cannot marry the partner in guilt during the life-time of the former spouse; nor in Louisiana, at any time, such marriage in the latter state being considered bigamy. In all the states, notably in New York, a jealous watch is maintained by the courts over their jurisdiction, and as a rule they refuse to acknowledge the validity of divorces granted to citizens of the state over which their jurisdiction lies by the courts of other states, unless such citizens have actually come under the jurisdiction of those courts. In Kansas, a divorce is granted to an applicant on the ground that the other party has secured a divorce in another state by whose law the defendant is forbidden to marry. If, for example, a wife secures a divorce by the law of New York, which would prohibit the husband from remarrying, the latter, by acquiring a residence in Kansas, may secure a divorce, and if the wife can be served with the papers in the case under the Kansas law, the validity of the divorce cannot be questioned in New York, and the defendant may legally remarry in that state. This affords an illustration of the way in which the legislation of one state may defeat the ends of justice as regarded in another, under the present inconsistent system of divorce in this country. The New York law sometimes permits a sort of polygamy or polyandry. Desertion for five years by either party without being heard from gives the deserted party the right to remarry. If the former return and a petition be duly filed in court, the second marriage is declared void, but only from the date of the decree of the courts. If, however, no such petition be entered and the parties concerned are satisfied, the husband may live in lawful wedlock with two or more wives, or one wife with two or more husbands. The children of both will inherit, and both wives are entitled to dower. From the conflict of laws in various countries on the subject of divorce, questions have frequently arisen as to the competency of a sentence of divorce by a tribunal having power according to the *lex loci* to pronounce such sentence, to annul a marriage contracted in a country where such divorce is not allowed. It appears now to be the generally received opinion, that wherever parties are domiciled they will be allowed to avail themselves of the law of this domicile. But the courts will not recognize a transient visit to a foreign country as sufficient ground to sustain a divorce.

DIX, DOROTHEA LYNDE, b. Mass., 1794. She established a school for girls in Boston, and took much interest in the unfortunate and criminal classes. In 1834, she went to Europe to study methods of the treatment of paupers, criminals, and insane persons. After a great deal of exertion she induced congress to pass a bill granting ten millions of acres of land to endow hospitals for the indigent and insane, but the measure was vetoed by Pres. Pierce. During the civil war she was superintendent of hospital nurses for the union army. Among her publications are *Garland of Flora*; *Private Hours*; *Conversations about Common Things*; *Prisons and Prison Discipline*. She d. 1887.

DIX, JOHN ADAMS, LL.D., 1798-1879; b. N. H.; a politician and soldier. In the war of 1812, he served as an ensign on the Canada frontier. In 1828, he began the practice of law in Cooperstown, N. Y., and became one of the leaders of the democratic party. In 1830, he was adjutant-gen. of the state, and in 1833, secretary of state and superintendent of common schools. He was chosen member of the assembly in 1842, and in 1845, appointed to fill a vacancy in the U. S. senate. In 1848, when the democratic party divided on the question of the extension of slavery, he went with the "free soil" wing and was their candidate for governor, but was not elected. In 1853, he was assistant treasurer of the United States in the city of New York. In 1860, he was chosen secretary of the treasury. Secession was just beginning, and New Orleans was substantially in the hands of the confederates. Two revenue cutters there were ordered

to New York by the secretary. The captain of one of them refusing to obey, secretary Dix immediately telegraphed to have him arrested and treated as a mutineer if he offered any resistance, closing the dispatch with the words: "If any man attempts to haul down the American flag, shoot him on the spot." In 1861, Dix was appointed maj.gen. of militia, and the same year maj.gen. of U. S. volunteers. In 1862, he was placed in command of the department of Maryland, and about the same time was sent to Fortress Monroe in command of the seventh army corps. He was in command in New York city at the time of the riots, July, 1863, and in 1864-65, commanded the department of the east. In the autumn of 1866, he was minister to France, and resigned, 1868. In 1872, the republican party elected him governor of New York. He retired in 1875, and passed the remainder of his life in private. Besides miscellaneous papers he was the author of *Resources of the City of New York*; *Decisions of the Superintendents of Common Schools of New York*, and *Laws relating to Common Schools*; *A Winter in Madeira*; *A Summer in Spain and France*; and two volumes of speeches.

DIX, MORGAN, S.T.D., b. New York, 1827; son of John A.; a clergyman of the Protestant Episcopal church, graduate of Columbia college and of the Protestant Episcopal general theological seminary. He was ordained in 1853, and in 1855, became assistant minister of Trinity church, New York. In 1859, he was assistant rector of the parish, and in Nov., 1862, after the death of Dr. Berrien, he succeeded as rector, where he still remains. He has published, among other works, *A Commentary on the Epistle to the Romans*; *An Exposition of the Epistles to the Galatians and Colossians*; *Lectures on the Pantheistic idea of an Impersonal Substance Deity*; *Essays on Christian Art*; *Lectures on the Two Estates*; *Lectures on the Prayer Book of Edward VI.*; *Memoirs of John A. Dix*; *Gospel and Philosophy*; *The Sacramental System*; *Harriet Starr Cannon* (1897), etc.

DIXEY, HENRY E., actor, was born in Boston, Jan. 6, 1859. At the age of nine years he became a member of the Howard Athenæum company, Boston, taking the part of "Peanuts," in the play *Under the Gaslight*. He afterward appeared in *Evangeline*. Other rôles in which he has appeared, are: "Dr. Syntax," in *Cinderella at School*; "Lorenzo," in *The Mascot*; "Sir Mincing Lane," in *Billee's Taylor*; "Bunthorne," in *Patience*; and "Sir Joseph Porter," in *Pinafore*. In 1883 he was engaged at the Bijou Theatre in New York, where he played in *Adonis*. In one or another of his parts, he has played in all the large cities of the United States. In 1889 he produced *The Seven Ages* at the Standard Theatre, New York, and in 1891, *The Solicitor*. In 1894 he became a member of Mr. Daly's company.

DIXIE, a popular name for the southern states of the American union, much in use about the time of the secession movement. It seems to have been adopted from a song of the slaves which set forth the delights of a region where they were under a good master—the region being called Dixie's Land, from a well-known kindly slave-holder of that name. The old song, or one based upon it, became widely favored as a sectional rival of *Yankee Doodle*.

DIXIE, Lady FLORENCE CAROLINE DOUGLAS, b. Scotland, 1859; dau. of the 7th marquis of Queensberry; married, 1875, Sir Alexander Beaumont Churchill Dixie, Bart. Her home is Bosworth Park, near Hinckley, in Leicestershire. Lady D. is an energetic traveler and vigorous writer; visited Patagonia with her husband and two brothers, and published *Across Patagonia*, 1880; traveled in South Africa, 1881, and published *Defence of Zululand*, 1882, and *In the Land of Misfortune*, 1882. Her later works include *Gloriana*, 1893; *The New Woman*, 1896, etc.

DIX ISLAND, off the Maine coast, about 10 m. s.e. of Rockland; a remarkable deposit of excellent granite, from which the New York post-office, the treasury building at Washington, and many other fine public buildings have been constructed. There are probably 1500 men and one or two hundred women and children on the island.

DIXON, a co. in n.e. Nebraska, bordering on the Missouri river; 468 sq. m.; pop. '90, 8084. Agriculture is the chief business. Co. seat, Ponca.

DIXON, a city and co. seat of Lee co., Ill., on Rock river and the Chicago and Northwestern and the Illinois Central railroads; 98 m. w. of Chicago. It contains the Northern Illinois normal school, Steinman institute, public hospital, public library, business college, national banks, electric lights, artesian well water, and manufactories of condensed milk, shoes, plows, etc. Pop. '90, 5161.

DIXON, EDWARD H., M.D., 1808-80; son of Jonathan; b. and d. New York. He studied at Rutgers medical college, and under Dr. Valentine Mott; was supt. of the house of refuge and of the asylum for deaf and dumb. He wrote *From Cradle to Grave* and several other medical works; and was widely known through his incisive editing of *The Scalpel*, 1849-61, a popular medical magazine.

DIXON, JOSEPH, 1799-1869; b. N. J. He invented friction-matches, and made important improvements in photography, lithography, bank-note printing, steel-smelting, lens-grinding, etc., and built for his own amusement the largest orchestration in the country, with cylinders 10 ft. in length. He was by turns a shoemaker, printer, lithographer, wood-engraver, and physician.

DIXON, WILLIAM HEPWORTH, an English author, was born in the West Riding of Yorkshire in 1821, and settled in London in 1846, where he soon acquired a considerable reputation by his writings. A series of papers published in the *Daily News*, "On the Literature of the Lower Orders," and another on "London Prisons," attracted

considerable attention. The latter reappeared in a volume published in 1850. Before this, but in the same year, he published *John Howard, and the Prison World of Europe*. It was with difficulty he could induce the publisher to accept it, yet when published, it went through three editions in one year. D. now devoted himself principally to historical biography. In 1851, appeared the first edition of his *William Penn*, a work called into existence by the onslaught made by Macaulay on the eminent Quaker, in which D. undertook to disprove Macaulay's charges. In 1853 was published his *Life of Blake*; and in the same year an anonymous pamphlet, entitled *The French in England*, designed to allay the fear of a French invasion then prevalent. In 1853, D. was appointed editor of the *Athenæum*—a chair he vacated in 1869. In 1860, he published his *Life of Lord Bacon*, and in 1863, *The Holy Land*. He gave the public *New America* in 1867; *Spiritual Wives* in 1868; *Free Russia* in 1870; *The Switzers* in 1872; *History of Two Queens* in 1873-74; *White Conquest* ('75); *British Cyprus* ('79). He d. '79.

DIXON'S EN TRANCE, a strait of 100 m. in length from e. to w. on the n.w. coast of America, divides Queen Charlotte island on the s. from the Prince of Wales archipelago on the north. It is, therefore, of some political importance, as separating the British possessions in this quarter from those of the United States. Lat. 54° 30' n., and long. 132° west.

DIXWELL, JOHN, 1608-89; of a good family in Kent; one of the judges of Charles I. After the accession of Charles II. he was condemned to death, but fled to America, and lived undiscovered in New Haven, under the assumed name of John Davids.

DIZFUL, a t. of Persia, on the river Dizful, in lat. 32° 10' n., and long. 48° 34' east. It is the capital and principal mart of its province (Khuzistan). A handsome bridge of twenty arches crosses the river here. The foundation is of stone and of ancient date, the upper portions are of brick and are modern. Pop. estimated at 16,000.

DIZIER, ST., a t. of France, in the department of Haute-Marne, 10 m. n. of Vassy, is situated on the Marne, which here begins to be navigable. It is a very long and narrow, but well-built town, the streets being wide, clean, and regular. In 1544, D. resisted for a month the assaults of a Spanish army under Ferdinand de Gonzaga; a resistance of the greatest consequence to the French ruler, Francis I., the delay enabling him to collect his forces to oppose the march of the Spaniards upon Paris. In 1814, the French twice defeated here the invading army of the allies. The chief industrial features of the place are iron forges and foundries, boat-building yards, in which a great number of river and canal boats are constructed, and cotton factories. There is also a considerable trade in wood, iron, and grain. Pop. '91, 13,372.

DJEZZAR, i.e., *Butcher*, the name given, on account of his cruelty, to Achmed Pasha, famous for his obstinate defense of Acre against Napoleon I. He was born in Bosnia about 1735, and rose, through murder and treason, from the condition of a slave to the pashalic of Acre. In the beginning of 1799, the French entered Syria from Egypt, and advanced from victory to victory till they reached Acre, which was laid siege to on the 20th Mar. By the advice of col. Philippeaux, a French émigré, and of sir Sydney Smith, the commander of the British fleet in the Levant, D. was induced to hold out; and such was the savage doggedness of his resolution, that Bonaparte was obliged to retire on the 21st of May. It is said that during the siege he sat on the floor of his palace, surrounded by a heap of gory skulls, distributing money to all who brought in the heads of Frenchmen. He died at Acre in 1804. D. was at times maniacal in his cruelties. He whipped off the heads of his wives without the slightest ceremony—seven at a time! But he had also moments of remorseful tenderness, in which he helped the poor and provided for those he had injured. He is said to have possessed the sharpest discernment, and was a very vigorous ruler.

DMITROV, an ancient t. of Russia, on the Jakhrama, an affluent to the Volga, 40 m. n. of Moscow. It covers a large area, a considerable part of which is occupied by gardens, but as a whole is poorly built. It contains a college and seven churches, and has manufactures of silk and cotton goods, tanneries, etc. Pop. 9206.

DNIE PER, one of the large rivers of Europe; has its source in certain swampy forest-lands in the n. of the Russian government of Smolensk. Its general direction, until it reaches Kiev, is south. From Kiev, its course is s.e. to Ekaterinoslav, where it turns directly s. past Alexandrovsk, below which town it sweeps round to the s.w., and pursues that direction until it debouches in the Black sea, between the governments of Kherson and Taurida, its embouchure forming a gulf of about 50 m. in length, with a breadth of from 1 to 6 miles. Its principal affluents are the Desna and Soj from the e., and the Pripet, the Beresina, and the Druz from the west. The total length of the D. is upwards of 1000 m., and it is navigable almost from its source, its breadth at Dorogobush, about 50 m. below its source, being 210 feet. Some of the finest governments of the Russian empire lie within its basin, with all of which its navigable branches and canals enable it to hold communication. In its upper part, it flows through a marshy forest territory; its middle and lower course is rocky. Below Ekaterinoslav, indeed, there are no less than 13 rapids in the course of about 40 m.; but these impediments to navigation have been overcome in part by blasting, and by splendid hydraulic-works erected by the Russian government. The produce of the provinces, consisting for the most part of corn, timber, iron, salt,

hemp, and linen, are usually conveyed down the river to ports on the Black sea, but many vessels pass annually from the D. to the Baltic by the Beresina and the Dwina. At Smolensk, the waters of the D. are frozen from Nov. to April; at Kiev, they are ice-bound only from Jan. to Mar. Sturgeon, carp, and pike abound in the river. As the *Borysthènes* the river was known in the 7th c. B.C. to the Greeks, who regarded it as the most valuable river on earth next to the Nile.

DNIE'STER, a river of Europe, flowing chiefly through Russia, but having its rise in the Carpathian mountains, in the Austrian crown-land of Galicia, about lat. 49° 10' n., long. 23° east. Its general course, until it reaches the Russian territory, is s.e.; it then runs e. for a short distance, and thence s.s.e., forming the boundary between Besserabia and Kherson, past Mohilev, Dubossari, and Bender, to the Black sea, which it enters by a shallow shore lake, 19 m. in length and 5 in breadth, between Akerman and Ovidiopol. The total length of the D. is between 500 and 600 m., its current throughout being very rapid. Until it reaches the Russian frontier, its right bank is skirted by offsets from the Carpathians; but at that point, the country, which above has been level on only one side, opens into a broad flat plain, through which the river, broken at intervals by masses of rock, rushes muddy and turbid. The downward navigation is interrupted by a series of falls and whirlpools. Wood and grain are the chief products conveyed down the river.

DOAB, a word of Sanscrit origin, signifying primarily "two rivers," but applied, like the Gr. *mesopotamia*, and the Lat. *interamnia*, to the country between two rivers. The two roots of the word are common to all the Aryan languages: the first appears in Lat. *duo*, Eng. *two*; the second in Celt. *avon*, a river, and in *Danube* or *Donau*. Punjab ("five rivers") is a term of the same kind; but while Punjab exists merely as a proper name of one particular region, Döab is used as the common appellation of any region in general that fulfills the conditions. When introduced, however, without local reference of any kind, the Döab means the space inclosed by the Jumna on the s.w. and the Ganges on the n.e.—a space extending from Allahabad to the base of the Himalayas, a distance of upwards of 500, with an average breadth of 55 miles. The fertility of this region has been much increased by the Ganges canal (q.v.).

DOANE, GEORGE WASHINGTON, D.D., LL.D., 1799-1859; born N. J.; graduate of Union college in 1818; ordained 1821; and rector for three years in Trinity (Prot. Ep.) church, New York. He was assistant minister and rector of Trinity church, Boston, 1828-32, and was then chosen bishop of New Jersey. While in this office he made special efforts for higher Christian education, and opened St. Mary's Hall at Burlington, on the Delaware river, a boarding-school for girls. In 1846, he founded Burlington college. His denomination flourished greatly under his episcopate. He published a volume of poems and a volume of sermons.

DOANE, WILLIAM CROSWELL, D.D., LL.D., b. Boston, Mass. 1832; was graduated from Burlington coll., Burlington, N.J., 1850; ordained priest in the Prot. Epis. church, 1856. During his diaconate he was curate to his father, the late Bp. George W. Doane; was rector of St. Barnabas' church and St. Mary's church, Burlington; St. John's church, Hartford, Conn.; and St. Peter's church, Albany, N. Y. He was consecrated bp. of the Prot. Epis. diocese of Albany, 1869. His chief works are: *A Volume of Questions on the Collects, Epistles, and Gospels*; and *The Life and Writings of The Rt. Rev. Geo. Washington Doane, S.T.D., LL.D.*, 4 vols.

DOBCHICK. See GREBE.

DOBELL, SYDNEY, a modern English poet, was b. in London in 1824. His father, who was a wine-merchant, removed to Cheltenham in 1835. Here D., whose education was entirely private, lived till 1850, when the *Roman* was published, and received with favor by the literary world. After the publication of this poem, D. resided for some time in Switzerland. Shortly after his return, the delicate state of his wife's health brought him to Edinburgh, where he remained till 1857. He afterwards resided on the Cotswold hills, near Gloucester. Besides the *Roman*, D. published *Bulder* (1854), *Sonnets on the War*, in conjunction with Mr. A. Smith (1855), and *England in time of War* (1856). His poems exhibit a singular mixture of the philosophical and the poetical spirit. Many of his passages are as spiritual in conception and lavish in imagery as the finest portions of Shelley; others, again, are as obscure, intricate, and involved as the rhymed enigmas of Cowley or Donne. In 1865, D. published a political pamphlet advocating a graduated suffrage and plurality of votes; and in 1871, *England's Day*, a lyric. He died in 1874. A collected edition of his poems was published in 1875; and in 1876, *Thoughts on Art, Philosophy, and Religion*. See *Life and Letters of Sydney Dobell* (1878).

DOBROWSKI, JOSEPH, the founder of Slavic philology, was b. Aug. 17, 1753, at Gyermet, near Raab, in Hungary, where his father, a Bohemian by birth, was stationed in garrison. He studied at the gymnasium of Deutschbrot, and subsequently at Klattau and Prague. In 1772, he entered the order of the Jesuits at Brünn, but on its dissolution ten months after, he returned to Prague, to continue his theological studies, and in 1776, became tutor in the family of the count von Nostitz. During the years 1780-87, he edited a critical journal of Bohemian and Moravian literature. This soon involved him in various strifes, and ultimately the review was "stopped" by the

authorities, but not before it had added largely to D.'s reputation. In 1792, at the expense of the royal Bohemian scientific society, he made a journey to Denmark, Sweden, and Russia, to search after the fate of those Bohemian books and MSS. which the Swedes had carried off from Prague during the thirty years' war. Two years after, he traveled through Germany, Italy, and Switzerland. On his return, he manifested symptoms of a disordered mind, and in 1801, had to be confined for some time. He speedily recovered, but was subject to intermittent fits of insanity until his death, which happened Jan. 6, 1829. D. is reckoned one of the highest, if not the very highest, authority on all matters connected with Bohemian history and literature. His principal productions are—*Scriptores rerum Bohemicarum* (Prag., 2 vols., 1783-1784); *Geschichte der Böhm. Sprache und ältern Literatur* (Prag. 1792); *Die Bildsamkeit der Slaw. Sprache* (Prag. 1799); *Deutsch-Böhm. Wörterbuch* (2 vols., Prag. 1802-21), in which he was largely assisted by other eminent Bohemian scholars; *Lehrgebäude der Böhm.-Sprache* (Prag. 1809); and *Institutiones Linguae Slavonicae Dialecti Veteris* (Vienna, 1822).

DOBRUDSCHA, or DOBRUDJA (anciently *Scythia Minor*), a region formerly Turkish, now belonging to Roumania, lies between the lower Danube and the Black sea; the Berlin congress of 1878, in transferring it to the principality, fixed the southern limit, formerly somewhat indefinite, at a line from Silistria on the Danube to Mangalia on the sea-coast. The n.e. of this region is occupied by marshes and the delta of the Danube; the rest of the area is partly steppe and partly cultivated corn-land. The inhabitants comprise a few Bulgarians and Roumanians, Tartars, Circassians, Osmanli Turks, Greeks, Armenians, and Jews. Salt is manufactured, and fishing carried on.

DOBSON, HENRY AUSTIN, English poet, was born at Plymouth Jan. 18, 1840, and was educated at Beaumaris, Coventry and Strasburg. He intended to adopt the profession of his father, civil engineering, but in 1856 entered the Board of Trade as a clerk. In 1868 he published some poems in Trollope's *St. Paul's Magazine* and soon attracted attention by his skillful and graceful handling of French artificial forms of verse—the rondeau, ballade and others—and by his delicate satire. Among his volumes of poetry are: *Vignettes in Rhyme and Vers de Société* (1873); *Proverbs in Porcelain* (1877); selections from these entitled *Old World Lyrics* (1883); *At the Sign of the Lyre* (1885). His prose includes *Lives of Hogarth* (1879), *Fielding* (1883), and *Steele* (1886); *Thomas Bewick and his Pupils* (1884); *Memoir of Horace Walpole* (1890); *Four French Women* (1873) and he has edited *Eighteenth-Century Essays* (1882); *Gay's Fables* (1882); *Goldsmith's Vicar of Wakefield* (1883); *Beaumarchais' Le Barbier de Séville* (1884); *Selections from Steele* (1885); *Proverbs in Porcelain* (1893); *The Story of Rosina* (1895); *Eighteenth Century Vignettes* (3d series, 1896), etc.

DOCTÆ (from the Gr. *dokēō*, to appear or seem) was the name given in the early church to those heretics who held that the human nature of Jesus Christ was a semblance and not a reality. The philosophers of polytheism, as well as of Judaism, had explained the appearances of divinities and of angels by holding that the assumption of bodies was only momentary, or in appearance. And when the Gnostic Christians found it impossible to conceive the essential union of the divine nature with a body composed of matter, which they held to be the seat of all evil, they had recourse to the same expedient. The difficulty was got over in one of three ways: the body of Christ was either considered a real earthly body, but not belonging essentially to his nature, and only assumed for a time; or it was declared to be a mere appearance or illusion; or, finally, it was believed to be a heavenly body, composed of ethereal substance, though having the appearance of being material. All the Gnostic heretics held docetism in one or other of these three forms, with the exception of those who were led by the same difficulty to deny the divine nature of Jesus Christ, and reduce him to a mere human sage. While the first of these alternative forms of heresy seems to have completely died out, the last, under various names, has continued to the present time. For a clear and learned account of docetism, consult Neander's *Dogmengeschichte* (History of Doctrine). English by J. E. Ryland; published by H. G. Bohn, in 2 vols., 1858.

DOCK, *Lapathum*, a sub-genus of the genus *rumex*, the other species of which are generally called sorrel (q.v.), containing those which are not acid, and of which the flowers are hermaphrodite. They are large perennial herbaceous plants, natives chiefly of temperate climates, with large generally lanceolate or ovate leaves, and panicles of small greenish flowers. They have great tap-roots, and are with difficulty eradicated from pastures. They also multiply rapidly by seed. The best mode of dealing with them, is generally found to be repeated cutting away of their leaves and shoots, by which the plants are killed. Many of the species prefer watery places. A number are natives of Britain, and several of the European ones have found their way to North America, where they have become troublesome weeds, a number of really indigenous species being also found there. Useless and even troublesome as the D. is generally esteemed, yet the large astringent roots are capable of being beneficially employed in medicine; and those of the great water D. (*R. hydrolapathum*) in particular—for which the Druids entertained a superstitious veneration—are administered as an antiscorbutic.

DOCK is any space or structure in or upon which a ship may be berthed or held for loading, unloading, repairing or safe-keeping. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all

times nearly the same, as the gate is opened only at full tide when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes to some degree with the work of loading or unloading. The closed docks are free from this inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term dock is also applied to a basin or enclosed water-space for the storage of floating timber, or the safe keeping of river steamers, barges or canal boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The great rise and fall of the tides about Great Britain has brought into use a remarkable system of docks for the loading and unloading of vessels in such ports as London, Liverpool and Glasgow, which are not required in American ports. To explain this it is only necessary to state that the rise and fall of the Thames at London Bridge, which is the head of navigation for sea commerce, is 19 feet, while in Liverpool the variation between high and low water is much greater. The shipping of London and that of Liverpool are of nearly equal magnitude, and the docks of both cities form wonderful networks of basins, those of Liverpool, taken collectively, being more modern than those of London. There are also extensive docks on the opposite side of the Mersey at Birkenhead. There are 28 docks controlled by the Mersey Docks and Harbor Board, the principal being: North and South Carriers, Canada, Huskisson, Sandon, Wellington, Bramley-Moore, Nelson, Salisbury, Collingwood, Stanley, Clarence, Trafalgar, Victoria, Waterloo, Princess, Georges, Canning, Albert, Salthouse, King's, Wapping, Queen's, Coburg, Brunswick, Toxteth, Harrington, and Herculaneum. *These vast docks were begun about a century and a half ago, but the great development has been, of course, within the present century. The combined dock area of Liverpool and Birkenhead is about 425 acres of water area and the quay line measures 18 miles in Liverpool and 9 miles in Birkenhead, or 27 miles in all. Among these basins are numerous graving docks, the total bottom length of which is about 15,000 ft. The excellence and abundance of Portland cement has been the cause of making most of the later docks to be built of concrete, and throughout, these docks give evidence of the most substantial construction.

The dry docks of the Thames are very numerous and of almost every size from 140 feet on the blocks up to 520 feet. A great many of them are built of wood, and wooden gates are common, but the principal docks are of masonry or concrete. The most extensive docks on the Thames are those recently constructed at Tilbury, about 15 miles below London. These docks comprise a tidal basin, the entrance to which is 100 yards in width. The entrance to the main basin is through a lock 80 feet in width. The walls are of concrete and the gates of the large lock are made of iron plates, which are opened and closed by hydraulic power. Four large graving docks form a feature of these works. These may be filled with water from the tidal basin or from the main dock through culverts. The total area of the outer tidal basin is 19½ acres. It contains 26 ft. of water at low tide and 46 feet at high tide. The main basin covers about 23 acres and has a depth of 38 feet. Three branch docks contain 9½, 9½ and 11 acres. These figures are sufficient to illustrate the magnitude of the work. The city of Glasgow also may be mentioned as having large dock accommodation. There are various kinds of docks used in repairing and building ships, such as depositing dock, dry dock, floating dock, graving dock, sectional dock, and so forth. A depositing dock is a caisson or an elevator for lifting vessels from the water and placing them upon stagings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a girder and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the girder is a large floating pontoon, connected with it by two rows of heavy booms that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks until the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.

Dry Dock, a dock or an excavated basin adjoining navigable water, provided with a gate, and so arranged that after the docking of a ship the water can be exhausted from it. Such docks are long and narrow, with sloping sides formed into steps. The pioneer in the building of timber dry docks in this country was Mr. J. E. Simpson, who for many years upheld the superiority of wood over stone for these structures. Their original cost is comparatively low. They resist the action of frost much better than do stone docks, and consequently the repairs required are less. In some weather ice is not so liable to form and remain upon wood as on stone, and they are lighter, so that work can be carried on in them longer than in stone docks. The first dock of this type was built in Boston in 1853 and 1854, and is still in use and in fair condition. At the government navy yards timber dry docks are replacing the older granite ones. These docks represent an excavated basin or slip lined throughout with Georgia pine timber, with sides and inner end sloping to the floor. The outer end is open, and is provided with heavy sill and abutment timbers. An iron caisson fits this opening and acts as a gate. The general dimensions are as follows: Length over all coping, 530 feet; length over all inside of caisson, 500 feet;

width on top amidships, 130 feet 4 inches; width on floor amidships, 50 feet; width on floor at entrance, 53 feet; depth of gate sill below high water, 25.5 feet; depth at centre, 25.7 feet. The floor, 460 feet by 50 feet, is surrounded by eight-inch tongued and grooved sheet piling. In good ground the practice has been to drive this down 7.5 feet, but in some instances, notably at the Brooklyn navy yard, where quicksands have been struck, it was driven down to 45 feet. The area included in this sheet piling contains round piles, driven in rows, three feet between centres transversely, and four feet in the direction of the length of the dock. Each row of piles carries a longitudinal square timber of Georgia pine. Upon these rest cross timbers three feet between centres, to which the bottom planking is spiked or bolted. Special rows of piles are driven to carry the keel blocks; a space ten feet wide beneath the centre of the dock contains extra closely spaced piling for this purpose; the timber used is generally about one foot square, and the piling one foot in diameter. Under the floor and surrounding the heads of the piles is a bed of Portland cement concrete, five feet thick at the centre, and rising toward each side between the transverse timbers to the height of one foot, giving a maximum thickness of six feet. Any water that may find its way thereto runs down to the central axis of the dock, owing to this slope. From each side of the floor the sides rise in steps with a slope of about 39°. They are lined with pieces of 10-inch plank, 11 inches in greatest height, but chamfered off at their rear and lower corner, so that their vertical face is only 3 inches high. They run horizontally around the dock, forming steps 8 inches high and 10 inches wide upon the parallel sides. These pieces, termed alters, are of Georgia pine, and are bolted to side-brace timbers, whose lower ends abut upon the floor timbers, and also against square longitudinal timbers bolted to the floor and representing the bottom alter. From the coping line tongued and grooved sheet piling is driven well below the floor level of the dock, so as to completely surround it. These docks are closed by floating caissons, which are iron vessels with sloping stern pieces that exactly fit the dock entrance. A heavy India-rubber packing is carried around the entrance sills and abutments against which the caissons bear. Two sills are provided, an outer and an inner one, which enables repairs to the inner or main sill to be attended to. For emptying the Brooklyn dock very powerful steam machinery has been provided. It consists of two centrifugal pumps of 42 inches diameter, driven by two vertical engines 28 inches diameter of cylinder by 24 inches stroke. Three steel boilers 13 feet in diameter by 11 feet in length supply the steam. The pumps have a capacity of 80,000 gallons a minute and can empty the dock in one hour and a half, when no vessel is in it. Open sluice-ways are made in the concrete floors on each side of the keelway, which lead to a drainage culvert and pumping well. The filling is done through the caisson culvert, with valves run through its body transversely. The caisson having been hauled across the mouth of the dock, water is admitted until it sinks into place, thus closing the dock water-tight. The pumps are then started and the water pumped out of the dock; as the ship settles down on the keel blocks she is kept upright by means of shores from her sides to the steps of the dock.

FLOATING DOCK, a capacious wooden or iron structure generally rectangular, and intended to serve as a graving dock. Sometimes floating docks are built in water-tight compartments, and can be sunk to the required depth by the admission of water to these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised still higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and lowered on the same principle. A floating dock may also be made so heavy as to sink of its own weight deep enough to receive the largest ship, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.

The hydraulic dry dock at San Francisco, into which the largest ocean steamers are lifted from the water to the level of the land, has a platform 450 long and 66 feet wide, composed of 36 steel transverse girders, 6 feet 4 inches deep. This is elevated by 36 hydraulic cylinders, one opposite each end of the girders, each cylinder containing a plunger with a vertical movement of 15 feet, and a lifting power of 8000 tons, and moved by hydraulic power.

Two vertical engines of 12-inch diam. and 16-inch stroke, making 120 revolutions, maintain the water pressure. An automatic accumulator regulates the steam furnished, and massive steel chocks work in harmony with the plungers, sliding into place when the platform with its load is lifted.

GRAVING DOCKS, are so called because they are used in graving or cleaning the bottom of ships. See **DRY DOCK**, above.

HALF-TIDE DOCK is a basin connecting two or more docks and communicating with the entrance basin.

SECTIONAL DOCK is a floating dock composed of a succession of pontoons or caissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the caisson, and, as they float, the vessel is raised. The rise and fall of the tide makes docks in England of somewhat more importance than in this country, which accounts for the elaborate docking systems on the Mersey and on the Thames. There are, however, some very fine docks in this country for the more convenient handling of merchandise, such as grain, sugar and cotton, and for the care of valuable goods. The

Atlantic docks and the Erie basin, in Brooklyn, are examples. The Atlantic docks were commenced in 1841 and were several years in construction. More than 200 acres of land were secured by the Atlantic Dock Company, and 40 acres of low marsh land were converted into a basin. Excavation over the whole 40 acres was done mainly with dredging machines and was carried to a depth of 20 feet below low water mark. The outer enclosure was made with piers of cribwork, consisting of timber filled with stone which were sunk into trenches 30 feet below high water mark. The cribs were 25 feet thick at the base and were placed 150 feet apart, that being the width of the pier. In the basin are a number of wooden piers where vessels are loaded. Upon the cribwork piers large stone warehouses are built. On the inland side is the commercial wharf, 2000 feet in length. The Erie basin, near the Atlantic dock, contains two graving docks. The granite dry docks in the government yards are among the finest in the world, but having been built before the present types of vessels were introduced, they are too short and not of sufficient width for modern requirements. They cost when new, about two millions of dollars. Most of the foreign nations have very extensive docking facilities at their navy yards, those recently finished by the Italians being among the most perfect in their fittings and appliances.

DOCKET, in law, originally signified a summary, in very brief form, of a document endorsed upon it or attached to it, so that its tenor might be known without complete perusal. It is probable that these memoranda in time came to be transcribed in a book to which the name docket was then applied. This was particularly the case with records of judgments, and in the United States a register of money judgments is called a docket. Thus, with a judgment after a mortgage foreclosure and sale, only the money deficiency, if there be one, for which the defendant is still liable personally, is docketed; and the docket serves as a judgment lien on his real property within the registration of the court. But the main use of the word docket in the United States is as the name of a list of causes before the court for trial, entered in the order in which the case is to be called, in a book kept by the clerk of the court. Such a docket is called by the practice of some courts the calendar. The docket or calendar is called over at the opening of the court each day—or sometimes once a week—and at the request of counsel the case may in the discretion of the judge be removed to a less advanced stage on the docket or put on that for the next term of court. A special use of the word in England is for a copy of a chancery decree left with the proper clerk of the court for enrollment. The derivation of the word is the same as that of the verb *to dock*. Obsolete forms of the word are *docquet*, *doquet* and *dogget*.

DOCTOR (Lat. *docēre*, to teach), a teacher. Originally, the word doctor was used, in accordance with its etymological derivation, to signify a teacher in general, and it was not till the 12th c. that it became a title of honor for the learned, irrespective of the function of communicating knowledge. It had frequently appended to it, in those early days, some additional expression intended to characterize the peculiar gift of its possessor. Thus, Thomas Aquinas was called the Doctor Angelicus; Bonaventura, the Doctor Seraphicus; Alexander de Hales, the Doctor Irrefragabilis; Duns Scotus, the Doctor Subtilis; Roger Bacon, the Doctor Mirabilis; William Occam, the Doctor Singularis; Gregory of Rimini, the Doctor Authenticus; Joseph Gerson, the Doctor Christianissimus; Thomas Bradwardine, the Doctor Profundus; and the like. The word had long been used, even in the universities, as a general expression for a teacher before it came to designate a degree or rank in the learned hierarchy to which only the united body of the teachers could advance or promote the candidate. These formal promotions commenced at Bologna in the 12th c., and the learned Irnerius, the regenerator of the Roman law at that period, is said to have introduced the ceremonial which was afterwards universally adopted. Irnerius, however, is a sort of mythical hero in university history, and such statements with regard to him must be received with caution. See **PROMOTION**. The university of Paris almost immediately followed in the footsteps of Bologna, the first reception of doctors having taken place in the year 1145, in favor of Peter Lombard and Gilbert de la Porrée, the greatest theologians of the day. Subsequently to this period, the emperors were in use expressly to confer upon the universities the right of appointing doctors of laws by their authority and in their name. The example of the emperors was speedily followed by the popes, who conferred corresponding rights with reference to the canon law. From the 11th to the 13th c., there seems reason to believe that, both in Italy and France, the terms master and doctor were pretty nearly synonymous. In the German universities, the professors of theology were more commonly known as masters; and in the beginning of the 15th c., in accordance with the practice of the university of Prague, the distinction was pretty consistently made between doctors of law and medicine, and masters of theology and philosophy. In modern times, the title of doctor has been applied almost everywhere to the three faculties of theology, law, and medicine. In Germany, it extends to that of philosophy, in which, in this country, the older title of master is still retained. The doctor's degree is, in general, conferred at the instance of the dean of the faculty to which it appertains. It is granted either on examination, and after the ancient form, at least, of publicly

defending a learned thesis in Latin has been observed, or else it is an honorary degree, conferred in consideration of the general reputation of the recipient for eminence in some particular branch of learning, philosophy, or science. See DEGREE. In Germany, the doctor ranks before the untitled nobility and next to the knight; and amongst themselves, doctors take the rank of the faculties to which they respectively belong, the first being theology, the second law, and the third medicine. In Oxford and Cambridge, and recently also in the German universities, doctors of music have been created. In the latter country, also, learned ladies have occasionally shared the honors of the doctorate. Dorothea Schlözer received the degree of doctor of philosophy from the university of Göttingen in 1787; Mariane Charlotte von Siebold, that of medicine from Giessen in 1817; and Johanna Wittenbach, in philosophy, from Marburg in 1827. Of the four ancient degrees of bachelor (q.v.), master of arts (q.v.), licentiate (q.v.), and doctor, the modern university of France has retained only those of bachelor, licentiate, and doctor. Up to the period of the revolution, the highest consideration attached to the title of doctor of the Sorbonne (q.v.)—that famous theological faculty, which was called “the perpetual council of the Gallican church,” and of which the present faculty of theology of the academy of Paris is but a feeble and lifeless reproduction. But though the degrees of the Sorbonne continued to enjoy, and apparently to merit, some degree of respect, such was by no means the case with those of the other schools of learning in France. Furettiére, in his dictionary, defines a bachelor as a man who learns, and a doctor as a man who forgets. The ridicule of Voltaire, La Fontaine, Le Sage with his Doctor Sangrado, and Molière in the *Malade Imaginaire*, will readily occur to our readers as illustrating the position which was then held very generally by French doctors.

In England, the doctor's degree was not introduced into the universities till the reign of John or of Henry III. At first it was a very rare and highly prized honor, and the ceremony of conferring it was attended by scenes of feasting and revelry, of which curious accounts will be found in Antony à Wood's *History and Antiquities of the University of Oxford*. Colored engravings of the dresses worn by doctors of the several faculties at Oxford and Cambridge are given in Ackermann's histories of these universities. As to professional uses of the degree of doctor of civil law, see DOCTORS COMMONS.

DOCTORS' COMMONS, formerly the college of the doctors of civil law in London, wherein the court of admiralty and the principal ecclesiastical courts were held. It was founded by Dr. Henry Harvey, dean of the arches, previous to which time the doctors had lived in Paternoster row. The original building was burned in the great fire in 1666, when the doctors removed for a time to Exeter house. After some time the commons was rebuilt, and the doctors returned to their former quarters. The courts which had been wont to hold their sittings at doctors commons are—the court of arches, the archdeacon's court, the prerogative court, the faculty court, the court of delegates, and the court of admiralty. The prerogative court is now amalgamated in the probate court (q.v.), and the court of delegates (q.v.) is transferred to the judicial committee of the privy council. At the time when these courts were all in full operation, their times of session were regulated by terms, as in the courts of equity and common law, a certain day in the week being assigned to each court for hearing its causes. The court of arches, the archdeacon's court, the faculty court, and the court of admiralty, have been changed, and no longer continue to exercise their functions in this once famous spot. The court of arches (so called from having sat *in arcubus*, or under the arches or bows of Bow church, Cheapside) is the court of appeal belonging to the archbishop of Canterbury. The judge in this court is styled dean of the arches, and he has jurisdiction, as the archbishop's principal official, in all ecclesiastical causes within the province of Canterbury. He has original jurisdiction, also, in certain causes by *letters of request* (see LETTERS). It was by virtue of letters of request that matrimonial causes were tried in the court of arches; but this branch of its jurisdiction is now removed to the divorce court. The archdeacon's court is an inferior court for the consideration of ecclesiastical questions occurring within the archdeaconry. For an account of the other courts mentioned in this article, see the several heads to which they refer. The practitioners in the several courts to which we have alluded were the doctors of civil law, called in the ecclesiastical courts advocates and proctors, who performed similar duties to those of attorneys or solicitors in the courts of law and equity. Both classes of practitioners required, in order to their admission to practice, to obtain the fiat of the archbishop, and afterwards to be duly admitted by the dean of the arches. The form of admission was in both cases attended with much ceremony. The doctor elect was introduced to the presiding judge by two doctors habited in their scarlet robes. The candidate then made a short Latin speech, and was admitted to practice in the courts. The habit of the doctors is a scarlet robe with a hood, trimmed with taffeta or white minever. The proctors were, in like manner, introduced by two senior proctors. In 1857, power was given by 20 and 21 Vict. c. 77, to dissolve the college of doctors commons and sell the property. The proctors received compensation, and all solicitors are allowed to act as proctors, and all proctors were turned into solicitors, all being alike solicitors of the supreme court, 21 and 22 Vict. cc. 95, 108; 23 and 24 Vict. c. 27; 33 and 34 Vict. c. 28, s. 30; 40 and 41 Vict. c. 25, s. 17. Nevertheless the old names continue, and will no doubt

only by degrees cease to be used in reference to ecclesiastical courts and proceedings. For a full account of doctors commons, see Stowe's *London*.

DOCTRINAIRE (a French term derived from doctrine) signifies, properly, the scientific taking up and exposition of a subject, as opposed to a treatment which is merely external, and which rests on accidental characteristics. In general, however, it is used as a term of reproach, to characterize views which are pedantic, schoolmasterly, and impractical. In this sense it was applied in France, during the restoration, by the reactionary court-party to the fraction of the parliamentary opposition, who supported scientific doctrines of constitutional liberty against the arbitrary will of the monarch. This party, which had its rallying-point in the salons of the duc de Broglie, was led in the chamber by Royer Collard, and supported in the press and before the public by Guizot, and the younger members of what afterwards became the Orleans party. The development of the constitution on the basis of the *charte* of Louis XVIII., was the watchword of those men; but their real inspiration was derived from England. When the revolution of 1830 occurred, they became the advisers and ministers of the king of the French, and were more deeply imbued with the principles of constitutional monarchy than any other political party that has ever existed in France. The true fathers of the *doctrinaires* were Mounier, Lally Tolland, Clermont Tonnerre, Talleyrand, and the abbé Montesquieu; and the cradle of the party was the original *comité* of the constitution, which, about twenty-five years before, elaborated the *charte* of 1814. Its later representatives found a center in the court of the exiled queen Marie Amalie at Claremont, and a vigorous supporter in her gifted son, the duc d'Aumale.

DOCTRINE. See DOGMA.

DOD, ALBERT BALDWIN, D.D.; 1805-45; son of Thaddens; graduate of Princeton, and tutor in the college, 1827-29 and in 1830 chosen professor of mathematics. He lectured upon political economy and architecture.

DOD, DANIEL, 1788-1823; b. Va., educated at Rutgers college, and especially devoted to the construction of steam machinery. He began when steam navigation was in its infancy, and soon became one of the most successful engine-builders in the country. He met his death in consequence of an explosion of a boiler on a steamboat in which he was experimenting on the East river, New York.

DODD, MOSES WOODRUFF, b. New Jersey, 1814; graduated at the coll. of New Jersey, 1837; studied theology at Princeton and Union theol. seminaries, 1837-39; publisher and bookseller in New York, 1839-70.

DODD, The Rev. WILLIAM, LL.D., was b. in 1729 at Bourne, in Lincolnshire; was educated, in the first place at a private school; and was admitted in 1745, as a sizar to Clare college, Cambridge, where after five years of study, he took his degree of B.A. Shortly after, he removed to London, received orders from the bishop of that city, and soon after gained a reputation as a popular preacher and as a successful littérateur. Through his celebrity as a divine and man of letters, and by means of flattering the great, he succeeded well in London, and in 1763 was appointed tutor to Philip Stanhope, the fifth earl of Chesterfield. His habits, however, were very expensive, and an income of £800 per annum, even when augmented by the produce of his literary labors, was not sufficient to supply his wants. This extravagance proved his ruin, as it tempted him to forge the signature of his former pupil, the earl of Chesterfield, to a bond for £4,200. For this crime he was arrested in Feb., 1777, and though he refunded the money, he was tried, convicted, and executed on the 27th of July. His writings are numerous and varied. His *Beauties of Shakespeare* (2 vols., Lond. 1753) is well known, as are also his *Reflections on Death* (1763), and *Thoughts on Death*.

DODDER, *Cuscuta*, a genus of plants referred by some botanists to the natural order *convolvulaceæ*, and regarded by others as the type of a small distinct natural order *cuscutaceæ*; which differs from *convolvulaceæ* in the habit of the plants, leafless climbing parasites, with flowers in dense clusters; in having scales on the tube of the corolla alternate with its segments; and in having a spiral thread-like embryo, lying in a mass of fleshy albumen, whilst the cotyledons are so small that the embryo has been described as destitute of them. There are about 50 known species of *cuscutaceæ*, chiefly found in the warmer temperate parts of the globe. The name D. is often extended to all of them. One or two species of *cuscuta* are natives of Britain, parasitic on leguminous plants, heath, thyme, hops, nettles, etc. A species of D. is very injurious to crops of flax in Germany, and leguminous crops often suffer from this cause in the s. of Europe. The seed of D. germinates in the ground, but the stem soon seeks to attach itself to plants by little rootlets which it sends out, and the original root dies. The appearance of D. has been described as resembling "fine, closely tangled, wet catgut."

DODDER-LAURELS, *Cassythaceæ*, parasitic plants appearing generally like dodders, but in many respects resembling laurals. They grow only in hot regions, where they supplant the dodders. Only a single species is known in the United States.

DODDRIDGE, a co. in n.w. West Virginia, crossed by a division of the Baltimore and Ohio railroad; 475 sq.m.; pop. '90, 12,183, with colored. The surface is hilly; chief business, agriculture. Co. seat, West Union.

DODDRIDGE, PHILIP, D.D., an eminent dissenting preacher and author, was b. in London in the year 1702, and educated for the ministry at a theological academy at Kibworth, in Leicestershire, presided over by a Mr. John Jennings. In 1722, he became pastor of the dissenting congregation at Kibworth, and in 1729 received a call to Northampton, where he also became president of the theological academy now removed from Kibworth to that town. Here he continued to preach and train young students for the ministry till within a short period of his death, which occurred Oct. 26, 1751, at Lisbon, whither he had gone for the benefit of his health. D. was a man of the most amiable character, deep piety, and extensive accomplishments. His principal work is *The Rise and Progress of Religion in the Soul* (1750). It has been translated into Dutch, German, Danish, and French. Besides this, may be mentioned *The Family Expositor* (6 vols., 1760-62); his *Course of Lectures* delivered to the students under his charge, and published by the Rev. Samuel Clarke (1763); and a great variety of sermons on miscellaneous religious topics. D. also wrote a considerable number of hymns, which hold a high rank among those used by English and Scotch dissenters.

DODECAGON. A regular polygon of 12 equal sides and angles. See REGULAR PLANE FIGURES.

DODECAHEDRON, one of the five regular solids, is bounded by 12 equal and regular pentagons. See REGULAR PLANE FIGURES.

DODECATH'EON, plants of the order *primulaceæ*. A species in the United States called American cowslip, shooting-star, and pride of Ohio, is a beautiful plant.

DÖDERLEIN, LUDWIG, a German philologist, was b. at Jena, 19th Dec., 1791; studied at Munich, Heidelberg, Erlangen, and Berlin; and in 1815 was appointed professor of philology at the academy of Berne. About the year 1820, he went to Erlangen as second professor of philology, and in 1827 became first professor and also director of the philological seminary. He died in 1863. His principal works are *Lateinische Synonymen und Etymologien* (6 vols., Leip. 1826-38); *Lateinische Wortbildung* (Leip. 1838); *Handbuch der Lat. Etymologie* (Leip. 1841); *Homerisches Glossarium* (3 vols., 1850-58). D. also edited several classical works, such as the *Œdipus Coloneus* of Sophocles, and the *Opera* of Tacitus.

DODGE, a co. in south central Georgia, formed in 1870, on the two Ocmulgee rivers, and intersected by the Southern railroad; about 414 sq. miles. Co. seat, Eastman. Pop. of co. '90, 11,452.

DODGE, a co. in s. e. Minnesota, crossed by the Chicago and Northwestern railroad, and drained by the tributaries of the Zumbro river; 430 sq. m.; pop. '90, 10,864. It is mostly a level and fertile prairie. Agriculture is the chief business. Co. seat, Mantorville.

DODGE, a co. in central Nebraska, n. of the Platte and intersected by the Elkhorn; crossed by the Union Pacific and other railroads; 520 sq. m.; pop. '90, 19,260. The productions are corn, wheat, oats, etc. Co. seat, Fremont.

DODGE, a co. in s. e. Wisconsin, on Rock river, crossed by several railroads; 900 sq. m.; pop. '90, 44,984. The surface is prairie with oak openings, and there are forests of ash, elm, maple, etc. The soil is very fertile. Co. seat, Juneau.

DODGE, MARY ABIGAIL (known in literature as "GAIL HAMILTON"), a brilliant, witty, and satirical writer; was born at Hamilton, Mass., about 1830, and was a school teacher in her youth. Among her works are *Country Living and Country Thinking* (1862); *Gala Days* (1863); *Woman's Wrongs* (1868); *The Battle of the Books* (1870); *Woman's Worth and Worthlessness* (1871); *Sermons to the Clergy* (1875); and *Our Common School System* (1880). Residing in Washington for many years she contributed vigorous letters to newspapers and periodicals on political subjects, and in the winter of 1890-91 conducted a Bible-class for adults in that city, giving the public the benefit of her "talks" in *A Washington Bible-Class* (1891). She d. in 1896.

DODGE, MARY ELIZABETH MAPES, b. New York, in 1838. She married when very young; was soon after left a widow with two children, and turned to literature as a means of support; contributed to many of the leading periodicals, and pub. *Irvington Stories*; *Hans Brinker, or the Silver Skates*, which has gone through several editions in this country, has been translated into five foreign languages, and was awarded a prize of 1500 francs by the French academy; *Theophilus and Others*; *Donald and Dorothy*, etc. She has been editor of *St. Nicholas* since its foundation.

DODGE, WILLIAM EARLE b. Conn., 1804; for many years a merchant of New York, where he became known as president of the American Bible society, and in connection with the Young Men's Christian Association, and as active in many philanthropic and benevolent efforts. He was one of the members of the peace convention of 1861, and a member of congress in 1865-67. He d. 1883. There is a statue of him in New York.

DODGSON, CHARLES LUTWIDGE, M.A., was born in England in 1832, graduated at Oxford University in 1854, entered the church in 1861, was mathematical lecturer at Christ Church College, 1855-81, and has written *A Syllabus of Plain and Algebraical Geometry* (1860); *Elementary Treatise on Determinants* (1867). He has achieved, under the pen name of Lewis Carroll, a world-wide fame, however, for his amusing books *Alice's Adventures in Wonderland* (1865); *Through the Looking Glass* (1871); *Sylvie and Bruno* (1889), etc.

DODINGTON, GEORGE BUBB, Baron Melcombe, 1691-1762; an English politician, graduate of Oxford, and in 1715 member of parliament. In 1716 he was envoy to Spain. In 1720 he inherited his uncle's vast estate, and built a mansion in Dorsetshire at a cost of \$700,000. He gathered around him the *litterati* of the time, among whom were Young, Thomson, and Fielding. In politics he was variable. His diary from 1749 until near his death, gives a vivid picture of the politics and manners of the time.

DODO, *Didus*, a genus of birds formerly ranked among the *Oreipennes* (q.v.) or struthious birds (ostrich, cassowary, etc.), although exhibiting very anomalous peculiarities; but still more interesting because, whilst it appears to be now completely extinct, its extinction has taken place very recently, and through the agency of man; at least one species (*D. ineptus*) being known to have existed less than 200 years since. It is described by several voyagers of the 16th and 17th centuries, and seems even to have been brought alive to Europe. It inhabited the islands of Bourbon and Mauritius. That any species of *D.* was ever seen by European voyagers in Madagascar, is not so certain; and the solitaire (q.v.) of the island of Rodriguez, now also extinct, was a very different bird. The *D.*, according to the descriptions given of it by those who saw it, and which are confirmed by pictorial representations, apparently not unworthy of confidence, was a bird larger than a swan; of a very heavy, clumsy form and corresponding gait, with short thick scale-covered legs; three rather short toes before and one behind; large head; very large bill, the upper mandible longer than the under, and much hooked at the point; the wings so short as to be of no use for flight, and furnished only with a few black feathers; the general plumage a kind of grayish-down; the tail merely a tuft or bunch of curiously curled feathers. The *D.* was so abundant when some of the first voyagers visited Mauritius, that they became satiated with its flesh, although they describe it, particularly the breast, as good for food. The birds were easily killed, being wholly unable to fly, and running slowly. Their speedy extinction after the islands began to be visited and settled, is thus easily accounted for. The *D.* seems to have been adapted for living in tropical woods, where the luxuriant vegetation afforded it a ready supply of food, and its powerful hooked bill, which has led some naturalists to assign it a place among birds of prey, was probably intended for tearing vegetable and not animal substances. However singular this bill is in a struthious bird, it has been well remarked that it is not more so than the very different bill of the *apteryx*.

There are rude figures of the *D.* in several works of the 17th c., and in particular one, evidently superior to the rest, in Bontius (edited by Piso, 1658)—who calls the bird *dronte* or *dodaers*—which perfectly correspond with the descriptions given of it, with a painting preserved in the British museum, said to have been drawn in Holland from the living bird, and with a representation of it discovered by prof. Owen in 1838 in Savery's picture of "Orpheus and the Beasts" at the Hague, which he thinks "must have been copied from a study of the living bird." A foot of the *D.* is amongst the valued treasures of the British museum.

DODONA, a city of Epirus, the seat of the oldest Grecian oracle there, is situated in one of the wildest districts s.w. of the lake of Janina. The Greek and Egyptian accounts of its origin differ. The priests of Jupiter in Egyptian Thebes related that two holy women were carried off from that city by a party of Phenicians, one of whom was sold in Libya, the other to the Greeks, and that these women founded the oracles at *D.* and Ammon. The inhabitants of *D.* related that two black doves took their flight from the city of Thebes, in Egypt, one of which flew to Libya, the other to *D.*; that the latter perched upon an oak, and with a human voice commanded that an oracle should be founded on the spot. Herodotus is of opinion, that if the Phenicians did actually carry off the two women already alluded to, one of them was probably sold into Greece; that the strange language and dark complexion had caused them to be likened to birds; and that when they became acquainted with the Greek tongue, they were said to have spoken with a human voice. Later authors ascribe the founding of the city to Deucalion. The sanctuary itself was dedicated to Jupiter, who manifested himself from the boughs of an oak, probably by the noise of the wind through the tree. This was explained by the priests, who were termed *selloi* or *helli*. The goddess Dione, by some said to be Aphrodite, by others Hera, afterwards appeared by the side of Jupiter, and the place of the priests was occupied by priestesses, who announced the will of the deity. *D.*, though not equal in renown to Delphi, was yet frequently consulted on occasions of importance, both by the Spartans and Athenians. Though the city of *D.* was destroyed in 219 B.C. by the *Ætoli*ans, it recovered at a later period, and was in existence in the 6th c. A.D. See *Dodone et ses Ruines*, by Carapanos (1878).

DODSLEY, ROBERT, author and publisher, was born in 1703, near Mansfield, in Nottingham. His father, who is said to have been a schoolmaster, apprenticed him to a stocking-weaver; but finding this employment unsuitable, *D.* ran away, and was afterwards engaged as footman. While thus employed he devoted his leisure moments to reading and the cultivation of letters, and eventually published, in 1732, a volume of poems entitled *The Muse in Livery, or the Footman's Miscellany*. His next production, *The Toy Shop*, a dramatic piece, was submitted in manuscript to Pope, who undertook to recommend it to Rich, the manager of Covent Garden theater. It was acted under Rich's management in 1735 with great success. The proceeds resulting from the publication of these his first two works enabled *D.* to commence business as a bookseller.

in which trade he was very successful. In 1737, his *King and the Miller of Mansfield* was brought out at Drury Lane, and met with an enthusiastic reception. This was followed by *Sir John Cockle at Court*; *The Blind Beggar of Bethnal Green*; and *Rex et Pontifex*, which were republished in a collected edition of his dramatic works with the title of *Trifles* (1748). Meantime, he was conducting his business with such ability and spirit, that in the course of three years after commencement he was in a position to buy copyrights. In 1738, he bought Johnson's *London*, giving for it no more than ten guineas. His most successful work was a tragedy called *Cleone*, which was acted at Covent Garden with extraordinary success. On its publication, 2,000 copies were sold the first day, and within the year the work ran through four editions. With *Cleone* he closed his career of dramatic authorship. D. was connected either as contributor or publisher, and occasionally as both, with several magazines. He is, however, chiefly remembered now on account of his *Select Collection of Old Plays* (12 vols. 8vo, 1789); and his *Collection of Poems by several Hands* (4 vols. 12mo, 1748). Besides the volume entitled *Trifles*, another volume of his collected works was published in 1772 under the title of *Miscellanies*. He died in 1764.—See Knight's *Shadows of the Old Booksellers* (1865).

DODWELL, EDWARD, 1767-1832; an English antiquarian writer and draughtsman. From 1801 to 1806 he traveled in Greece, and spent the rest of his life for the most part in Naples and Rome. He wrote *A Classical and Topographical Tour through Greece*, and *Views and Descriptions of Cyclopean and Pelasgic Remains in Italy and Greece*, the last profusely illustrated. His widow, who was 30 years his junior, became the countess of Spaur, and was conspicuous, not only for beauty, but in the political life of Rome.

DODWELL, HENRY, 1641-1711; a native of Dublin, educated at a free school, and by the death of his parents reduced to great poverty. He became a fellow of Trinity college, and in 1688 was elected Camden professor of history at Oxford; but in 1691, he was deprived of his professorship for refusing to take the oath of allegiance to William and Mary. The remainder of his life was devoted to literary labors in chronology and ecclesiastical polity, and resulted in a number of valuable works. In religion, he was extreme, at one time promulgating the notion that immortality could be enjoyed only by those who had received baptism at the hands of one set of regularly ordained clergy, and was therefore a privilege from which dissenters were hopelessly excluded; again arguing from Scripture and the early fathers that the soul of man is naturally mortal, and gains continuance by only the special act of God. His son HENRY was the author of *Christianity not founded on Argument*, to which WILLIAM, another son, published a reply.

DOE, JOHN, the fictitious plaintiff in ejectment, whose services are dispensed with since the abolition of the fiction. See EJECTMENT.

DOESBORGH (*Drususburg*), a t. in the Netherlands, province of Gelderland, lies 11 m. e.n.e. from Arnhem, on the right bank of the Yssel. It was formerly fortified, but the walls have been broken down, planted with trees, and formed into pleasant promenades. An intrenched camp has been constructed on the n.e. side, between the Yssel and Old Yssel, which here unite. The streets are broad, and many of the houses handsome. There are several benevolent institutions, a grammar-school, boarding-school for boys and girls, and good public schools. The trade is considerable. Ship-building, book-printing, the making of eau de Cologne, preparing mustard, etc., are carried on. Pop. 4484.

DOFFER is that part of a carding-machine which takes the cotton from the cylinder when carded. See CARDING.

DOG, *Canis*, a genus of digitigrade carnivorous quadrupeds (see DIGITIGRADA; CARNIVORA), which, according to Linnæus, included all now forming the family *canidæ* (q.v.), and hyenas. In the genus as now restricted, wolves and jackals are generally included by naturalists, along with those animals to which alone the name dog is popularly applied, and a distinctive character of principal importance is found in the pupil of the eye, which is always round—contracting circularly, whilst in foxes it assumes the form of a section of a lens when contracted. The present article is limited to dogs in the common acceptation of the term, wolves and jackals being the subjects of separate articles; and only remarks relative to dogs in general will here find a place, many of the particular kinds being sufficiently important to be separately noticed.

At the very outset we encounter one of the most perplexing and difficult questions in natural history, as to the number of *species* of dog, and the origin of the domestic dog; two questions in appearance, but rather one in reality, and one on which the opinions of the most eminent naturalists are very much divided. According to some, all domestic dogs are to be regarded as of one species; and as in the case of some other valuable domestic animals, that species is not certainly known to exist in a truly wild state, all the wild dogs which must be admitted to belong to the same species being viewed as the offspring of domestic dogs which have returned to a wild state, and in which, however, it is supposed that the original type or characteristics of the species, modified by domestication, have in a great measure reappeared. According to others, there are numerous species of dog, originally distinct, which have been domesticated

by the inhabitants of different countries, but which, however, are very nearly related not only in their physical characters but in their dispositions and in some of their principal instincts, and which were capable of intermixing, not perhaps indiscriminately, but within certain limits, and so as to produce new races. By some who hold the first of these opinions, it is further maintained that the wolf and the dog are one species, and that all domestic dogs are derived from the wolf; whilst others advocate the claims of the jackal to be regarded as their original parent and type. By some of those who hold the species to be numerous, it is supposed not improbable that the blood of wolves and of jackals may be mixed in some of the domestic races with that of the original dogs. It is impossible for us to do more than state these different views, and a few of the principal arguments by which they are supported.

It is admitted on all hands, that there is great diversity among the different kinds of domestic dogs, many distinct races having long existed, which differ not only in size and other physical characters, but to a notable extent also in dispositions and instincts; it is further admitted that there appear to be no definite limits to the possible intermixture of these races with each other. So great is the diversity of physical characters, that naturalists of the greatest eminence almost acknowledge themselves incapable of pointing out any that are common to all dogs, and yet distinguish them all from the different species of wolves and jackals; and in fact, the *recurved tail*, not apparently a character of the first importance, is named by Cuvier himself as the most certain and unvarying specific distinction. The obliquity of the eyes of wolves is also contrasted with the more forward direction of those of dogs, which is accounted for—in favor of the theory of wolfish origin—by the supposition that it results from “the constant habit, for many successive generations, of looking forwards to their master, and obeying his voice.”—Bell’s *British Quadrupeds*. This, on the other side, is treated with ridicule; it is certainly a transition from the region of observation and ascertained fact to that of mere theory and conjecture. In size, dogs differ so widely that one is not as large as the head of another; the difference in form of body, head, or limbs, is almost equally great between the Newfoundland dog or the mastiff and the greyhound. The gradations, however, from one form or character to another, render it impossible to draw a fixed limit. In some races of dog, the hind-feet as well as the forefeet have five toes, instead of four, which is more common; but this has not been much insisted on as a ground of specific distinction. Greater value ought perhaps to be attached to the want in some, as the dholes (q.v.) of India, of the second tubercular tooth in the lower jaw; the hairiness of the soles of the feet of some is perhaps also not unimportant; and in favor of the opinion that domestic dogs have originated from an intermixture of several species, it has been urged that the number of teats in the female varies, and that there is sometimes even a difference between the number on one side and on the other, which has never been observed to be the case in wild dogs, and in them the number in the same kind is always uniform. Some of these points, however, have not received the investigation necessary to a confident determination of the measure of importance which ought to be assigned to them.

It seems to have been too hastily taken for granted, in favor of the opinion that there is only one species of dog, that all the wild races, even the dholes and the dingo, have sprung from domestic progenitors. There is certainly no evidence of this; and the fact that wild races exist, exhibiting marked diversities of character, in countries widely remote and of very different climates, is referred to with confidence on the other side, as affording at least a strong presumption in favor of the supposition that man has, in different countries, domesticated the species which he found there. We do not yet know enough of the amount and limits of the changes which circumstances and climate may produce, to warrant any confident conclusions on that ground. And if we were to adopt the views of those who ascribe least to such causes, we might yet demand them to show why, although from certain original types no mixed race can originate, there may not yet be other original types capable of such combination, or why the limits must be held equally impassable between all that were framed by an original act of creation. That there was only one original pair of the human race, may be held, without our of necessity holding that there was only one original pair of dogs. But to this consideration due place has, perhaps, scarcely been given.

That the common fox—or any species of fox—is a parent of any race of dogs, is not the opinion of any naturalist. Some dogs have a somewhat fox-like appearance, and indeed it is now generally admitted that the dog and fox will breed together, but as it has not been proved that the individuals of the cross will breed together, this fact does not warrant the assertion that the dog and fox belong to the same species. Instances of commixture between the dog and wolf have occurred in greater numbers, and without the compulsion of confinement, but in this case, too, the only recognized proof of identity of species—namely, the permanent fertility of the progeny—is wanting.

In favor of the specific identity of the dog and wolf, one of the strongest arguments is drawn from the equality of the period of gestation—63 days. But it may be remarked that an inequality of the period would have afforded a much stronger argument on the other side.

Against the identity of the dog and wolf, the difference of disposition has been strongly urged. In reply, it is shown by well-authenticated instances that the wolf is

very capable of that attachment to man which so remarkably characterizes the dog. There is greater value, perhaps, in the argument of col. Hamilton Smith, that "if domestic dogs were merely wolves modified by the influence of man's wants, surely the curs of Mohammedan states, refused domestic care, and only tolerated in Asiatic cities in the capacity of scavengers, would long since have resumed some of the characters of the wolf."

Buffon's notion, that the shepherd dog is the original type of the whole species, from which all dogs are derived, is merely fanciful, and his endeavor to support it by a comparative view of the different kinds, only exhibits a certain amount of ingenuity.

The shepherd's dog is one of the kinds of dog having greatest development of brain, but it is still greater in the spaniel. The skulls of dogs, however, neither exhibit very marked distinctions when compared with each other, nor when compared with those of wolves and jackals.

It is universally believed that the diversity of color exhibited by many dogs is a result of domestication, as it is neither found in those which may be supposed to exist in a state of original wildness, nor in those wild races which are certainly known to be the progeny of domestic dogs, a return to uniformity of coloring being apparently one of the most speedy consequences of a return to wildness. Black, reddish-brown, and white, the uniform colors observed in wild dogs, are, however, the colors which chiefly appear mixed in domestic races.

Pendulous ears are generally regarded as another result of domestication in dogs, as in rabbits; and it is certain that the wild races known have erect and pointed ears; but no wild race has been discovered at all corresponding to the mastiff in some of its other most notable characters, particularly the shortness of the muzzle, and depth of the chops, and it has therefore been conjectured that this and kindred races may have derived their origin from some wild dog of the interior of Asia, which has not yet come under the notice of any scientific observer.

The dog has been a domestic animal from a very early period. The earliest allusions to it are in the books of Moses, but they indeed correspond with the dislike and contempt still commonly entertained for it by many of the nations of southern Asia. By Homer, however, it is very differently mentioned; and "there is not a modern story of the kind which can surpass the affecting simplicity with which the poor dog's dying recognition of his long-lost master is related by one who wrote, probably, not less than 2,700 years ago." The sculptures of Nineveh, and the hieroglyphics of Egypt, attest the very early domestication of the dog, and the existence of races similar to some of those which exist at the present day; and the high value attached to it by many nations is further attested by the place assigned to it, or its image, as emblematic of the attributes which they ascribed to their gods. We do not now set so high a value on the dog, in consideration of mere usefulness to man, as on some of the other domestic animals; yet to the savage it is perhaps the most important of all, and some have supposed that by its aid the subjugation of other animals may have been first accomplished. Cuvier makes the strong assertion, that the dog "is the most complete, the most singular, and the most useful conquest ever made by man." The dog, far more than any other animal, becomes a humble friend and companion of man, often seeming actually to know and sympathize with the joys and sorrows of his master; and on this account it is, that he is alike "the pampered minion of royalty, and the half-starved partaker of the beggar's crust."

The uses to which the dog is applied are numerous, and correspond, in some measure, not only with distinct physical characters, but with remarkably distinct instincts of different breeds. Thus, whilst in some countries dogs are chiefly employed as beasts of draught, particularly for drawing sledges in the frozen regions of the north, and in other countries chiefly for the chase, the exquisite scent of some kinds, and the remarkable fleetness of others, variously recommending them for this use, we find them also rendering important services in the care of sheep and other cattle, and endowed with hereditary instincts wonderfully fitted for this purpose, and we find them, with like adaptation of instinct, highly valuable in watching and protecting the abodes and properties of their masters. Not the least interesting of the employments to which the dog has been devoted by man, is that of leading about the blind, which is often done with an intelligent and affectionate solicitude highly worthy of admiration.

Anecdotes illustrating not only the instincts, but the intelligence and affection of dogs, are familiar to every one, and form one of the most pleasing parts of many a book of natural history. Attractive to children, they are worthy of all the consideration which they can receive from the most philosophic mind. Volumes have been filled, and more volumes might easily be filled, with anecdotes well authenticated, and well worthy of preservation.

The dog produces usually from six to ten young ones at a birth. They are born blind, open their eyes about the tenth or twelfth day, attain their full growth in about two years, seldom live more than twelve or fifteen years, and almost never more than twenty.

No satisfactory classification of the different kinds of dog has ever been made. What some naturalists regard as types of species, others pronounce to be mere mongrel varieties. Nor can any principle of arrangement be found in form, roughness or smooth-

ness of fur, or other such character, which will not associate kinds that are in other respects widely dissimilar, and separate some that are nearly allied.

Col. Hamilton Smith arranges domestic dogs in six groups or sections: 1. "The wolf dogs," including the Siberian dog, Esquimaux dog, Iceland dog, Newfoundland dog, Nootka dog, sheep dog, great wolf dog, great St. Bernard dog, Pomeranian dog, etc. 2. "The watch and cattle dogs," including the German boar-hound, Danish dog, matin, dog of the North American Indians, etc. 3. "The greyhounds," including the Brinjarree dog, different kinds of greyhound, Irish hound, lurcher, Egyptian street dog, etc. 4. "The hounds," including the bloodhound, old southern hound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, water dog or poodle, etc. 5. "The cur dogs," including the terrier and its allies. 6. "The mastiffs," including different kinds of mastiff, the bull dog, pug dog, etc. Col. H. Smith does not include in any of these groups the dholes, dingo, etc., which he even separates from the genus *canis*.—Mr. Richardson arranges dogs in three great groups, "indicated by the least variable part of their osteological structure, cranial development." 1. Including the Irish wolf dog, highland deerhound, all kinds of greyhounds, and the tiger hound, characterized by *convergent* parietal bones, an elongated muzzle, and high and slender form. 2. Including the great Dane, the French matin, the pariah of India, the bloodhound, staghound, foxhound, harrier, beagle, pointers, terriers, turnspit, Newfoundland dog, Labrador dog, Pomeranian dog, Esquimaux dog, Siberian dog, Iceland dog, shepherd's dog, etc., characterized by *parallel* parietal bones, and generally by much acuteness of smell. 3. Including mastiffs, the great St. Bernard dog, bull dog, pug dog, etc., characterized by sensibly *divergent* parietal bones, bulk of body, robust structure, and combative propensities.

See Burges, *American Kennel and Sporting Dogs* (1876); Walsh, *The Dog in Health and Disease* (1879); Shaw, *Illustrated Book of the Dog* (1884).

DOG. In law a distinction is made in regard to the rights of property in animals between those of a wild nature (*feræ nature*) and those of a domestic kind; the dog belongs to the latter classification. In the United States statutes exist in probably all the states which directly or by implication recognize the right of property in dogs and permit such ownership, though usually under special regulations. Often restrictions are laid down also by municipal laws. The right of property implied in the ownership of dogs carries with it the responsibility for illegal injury caused by the animal, and also makes the theft of it a punishable offense. Both by common law and by statute the keeping of vicious or dangerous dogs is in itself illegal unless proper precautions are taken to make any injury by them impossible. One who maintains a vicious or dangerous animal in such a way as to threaten bodily harm to his neighbors may be indicted for maintaining a common nuisance. Local restrictions, either by state statute or municipal police regulation, generally require the licensing or registration of dogs, particularly in cities and districts where sheep-raising is carried on. Some local ordinances require that every animal of this kind shall wear a muzzle bearing the owner's address. In some states it is the law that a prosecution for theft of a dog cannot be maintained if its owner has not complied with the law in regard to taxes or license. Generally speaking, unless authorized by the state or city so to do, no person may without making himself liable to prosecution kill the dog of another unless he or some one under his lawful protection be in immediate danger of injury from the animal, or it be known to be rabid. Some states or cities have laws requiring the muzzling of dogs for a certain number of weeks in the year; others forbid the letting loose of an unmuzzled dog in the streets or public highways at any time. It is now the general custom for large cities to appoint and license regular dog catchers to seize any unmuzzled dogs and to take them to a place provided by the city, where they are held for redemption by their owner on paying a certain fine, in default of which redemption they are destroyed. The owner of a dog which has injured the person or property of another is liable for damages in a civil suit, the injury being in the nature of a tort; he cannot plead in mitigation of damages ignorance on his part of the vicious or destructive character of the animal. It has been held that the owner is bound to take every reasonable precaution, even if he has no special cause to suppose that his animal is viciously inclined; and the injured person will be awarded damages in such a civil suit as we have described unless it can be clearly shown by the evidence that he was himself in fault. As an example of this we may mention that it has been held that it is no defense in an action for damages against the owner of a dog that a person bitten by the animal had first accidentally injured it. Another decision of similar purport was in effect that where the owner of a dog knew that it had previously killed a sheep, and still retained it without taking special precautions against its going loose, he was liable for all subsequent injury done by the dog even to other animals than sheep, as, for instance, to a horse. Where statute or police provisions do not enforce muzzling or other restraint of dogs, still the courts may deal with the subject under the common law principles enunciated at the beginning of this article.

DOG BANE, *Apocynum*, a genus of plants of the natural order *apocynaceæ*, having bell-shaped flowers, no style, and the fruit a long linear follicle. Some of the species are shrubby, some herbaceous; some extend into colder climates than is usual for plants of this order. The D. of North America (*a. androsaë-mifolium*), a perennial herbaceous

plant, about 4 ft. high, with smooth stem, much milky juice, smooth ovate leaves, and whitish rose-colored flowers, growing in open barren places from Georgia to Canada, is valued for the medicinal properties of the bark of its root, which is emetic, diaphoretic, and in small doses tonic. The root of CANADIAN HEMP (*A. cannabinum*), a plant noticed on another account in the article *Apocynaceæ*, possesses similar properties.

DOG-DAYS, or **CANICULAR DAYS** (q.v.), are the twenty days immediately preceding, and the twenty days following, the rising of the dog-star Sirius. It falls at present between July 3 and Aug. 11. Ancient astronomers and astrologers named these days thus, attributing the great heat of summer and consequent disease entirely to the influence of the dog-star; but modern astronomers have proved the error of this reckoning, because, owing to precession (q.v.), the time is coming when Sirius will rise in the winter.

DOG DISTEMPER is a kind of violent catarrh, common among dogs, especially when young, producing running at the eyes and nose and a dry cough, followed by wasting of flesh and loss of strength, and sometimes by inflammation of the lungs and dysentery. The usual remedies are laxatives, emetics, and occasional bleeding. Astringents are useful in diarrhea, and fits may be modified by anodynes and warm baths.

DOGE (equivalent to *duke*) was the name of the chief magistrate, possessing princely rank, in the republics of Venice and Genoa. Dogate or dogado, both from the Latin *ducatus*, duchy, is used to indicate the dignity of doge. We find doges of Venice elected by the people, but enjoying almost the rights of absolute monarchs, as early as the beginning of the 8th century. Their power, however was considerably reduced towards the end of the 12th c., through the creation of a great council, composed of 470 members, chosen from nobles as well as citizens, and invested with legislative power. These afterwards appointed six of their own number to superintend the D. in the exercise of his executive power. Further, the *pregadi*, or nobles, who formerly were admitted by the D. to a share in the public affairs, were organized into a regular board of administration, numbering 60 members. By the new constitution, the people, too, lost the most essential of their rights—viz., the right of electing the doge. This right was now changed into a privilege belonging exclusively to the great council, whose members elected 24 from among themselves, and these latter again elected, by ballot, 12 of their own number, upon whom devolved the right of appointing a doge. Sebastiano Ziani was the first D. thus elected, 1177; and on the occasion of his elevation to office, he scattered money among the people, to console them for the loss of their rights—an act which was imitated by his successors, and soon became a recognized custom, as was also the case regarding the manner in which he went through the ceremony of wedding the Adriatic sea. The pope Alexander III., whom, during his quarrels with the emperor Frederic I., the D. had faithfully supported, sent him, together with other privileges, a ring, as the symbol of domination the republic had acquired over the Adriatic. Accordingly, a marriage ceremony took place on Ascension day—a ring being thrown from the ship *Bucentaur* into the sea, to show that as the wife is subject to her husband, so is the Adriatic sea to the republic of Venice. The practical bearing of the ceremony soon appeared in the shape of stringent measures, regulating the navigation of the Adriatic, and imposing tribute upon all foreign ships. The power of the D. underwent, in 1179, a signal modification; the Treble Quarantia—a high court of justice, composed originally of 40 members—having been erected, as also the board of *advogatori*, for the settlement of fiscal questions instituted. During the reign of Jacopo Tiepolo, 1229–49, a new restriction arose from the creation of an independent police, and a still greater one from the formation of a tribunal consisting of three inquisitors and five correctors, who, on the demise of a D., had to examine his conduct, sifting the minutest particulars of his private life. All these changes were effected by the great council, to the thorough exclusion of the people. In 1268, the great council, in order to cut short all family influence upon the affairs of the state, devised a curious and extremely complicated mode of election; but notwithstanding the limitations new and old, the power of a D. continued great, if he was only wise enough to profit by the contentions between nobles and citizens, the disputes of the different authorities, and especially by his own position as commander-in-chief of the forces and high-admiral of the navy. This last prerogative of the D. remained in vigor up to 1628, when, by a formal enactment, the D. was prohibited the exercise of such command, unless he were authorized by the council of forty. Other privileges, however, belonging originally to the dogate, were abrogated or circumscribed long before this, and especially during the period 1289–1311. Thus, at the instigation of the D., Gradenigo, who was actuated by jealousy towards the mighty family Tiepolo, the famous law of “closing the great council” was passed, and by it the whole legislative and judicial power made the heirloom of those families whose names were inscribed in the Golden Book, or *Libro d’Oro*. About that time (1309), ecclesiastics of any degree were declared unfit for political or judicial functions. To counterbalance the influence of discontented nobles, a public feast was instituted—to come off yearly—at which the D. gave a dinner to the fishermen, fraternizing with them in testimony of equality. Shortly before Gradenigo’s death, that terrible tribunal, the council of the ten, was erected, which was to be the highest in the state, irresponsible, and entitled to pass judgment upon the D. himself. In the meanwhile, the great council managed to get the functions,

public as well as private, of the D. circumscribed in the minutest way. It was ordered that the D. should not announce his accession, except to the princes of Italy; neither was he permitted the opening of dispatches emanating from the popes or from princes; the kissing of his hands, or kneeling down in his presence, was strictly interdicted. He could not leave town, be possessed of real property abroad, or allow his children to contract matrimonial connections with foreign houses, accept donations, etc. He had to submit to the continued presence of two *advogadori*, to be fined for the least mistake, and bear the expenses of the ducal dignity from his own purse. To all these restrictions and burdens the D. declared himself liable on the occasion of his coronation, by signing a document headed "Promissione." The state costume and retinue of the D. were minutely defined, and a trifle fixed as his salary. As a symbol of princely dignity, the D. wore a horned cap, and had the title of serenity. The credentials of ambassadors were written in his name, but signed by a secretary of state, and sealed with the arms of the republic. The money was struck in his name, but not with his stamp or arms. All the magistrates rose and saluted the D. when he came into council, and the D. rose to none but to foreign ambassadors. His family was exempt from the jurisdiction of the master of the ceremonies; and his children, though excluded from public offices, were allowed to have staff-officers, and gondoliers in livery. After the death of And. Dandolo, 1254, on a motion from the correctors, the three presidents of the *quarantia*, and later six ministers, were joined to the six privy-councillors of the D., who, together with the above-named, has formed henceforward the so-called Signoria Serenissima. At that stage the rank of D. could no longer be an object of ambition, and as early as 1339, a law was necessary to prohibit the D. elected from resigning his place. And. Contarini, 1367, accepted the proffered dignity only upon the threat of being declared a traitor to the country. In 1413, by a law emanating from the great council, the D. was even denied the title of Signoria, that of Messere being substituted instead; at the same time he was deprived of the right of convening an *arengo*, or meeting of the people. With the fall of the Venetian republic, 1797, the dignity of D. also disappeared. There were in all 73 D. at Venice, the first of whom, Anafeste (Paoluccio) was elected 697; the last, Manin (Lodovico), 1788. In the Palazzo Ducale, the celebrated frieze of the D. is to be seen round the Sala del Maggior Consiglio, exhibiting 72 portraits, and one space covered with a black veil, with an inscription, indicating that Faliero (Marino) was beheaded for high treason.

The republic of Genoa elected, after a victory gained by the party of the people (1339), Simon Boccanera for its first doge. He was elected for life, and with absolute power, of which, however, he allowed a share to 12 aldermen (*anziani*), the one half being chosen from the *cittadini* (citizens), the other among the *nobili* (nobles). In the long run of centuries, the power, duration, and splendor of the ducal seat underwent frequent changes, arising from the vicissitudes of the state and the hostilities between the popular and aristocratic parties. A constitution for defining the functions and prerogatives of the D. was framed in 1528, after the great victory of And. Doria over the French. According to this constitution, which, with slight modifications, remained till the end of the republic, the dignity of D. was of two years' duration, under restrictions similar to those at Venice. The candidate was to be a noble, and at least 50 years of age. The D. presided, with the right of veto, in the sittings of the great council, composed of 300 members, as also in those of a smaller one, consisting of 100. These two councils exercised the legislative power, whereas the executive was vested in the D., together with 12 *governadori* and eight *procuratori*, among these latter being always the D. retiring. During the time of his government, the D. resided in the state palace, where he was liable to the same restrictions and ceremonies which were in use at Venice. When, in 1797, Genoa was occupied by the French, the dogate ceased to exist; in 1802, the Genoese republic being, conjointly with the Ligurian, re-established, the ducal dignity was once more resuscitated; but in 1804, it disappeared forever, the republic itself having been dissolved.

DOGFISH, the popular name of some of the smaller species of shark; apparently owing its origin—like the names porbeagle, hound, etc., bestowed on others of the same family—to their habit of following their prey like dogs hunting in packs. Of the species to which the name D. is given on American coasts, one of the most abundant is that sometimes called the common D. (*acanthias vulgaris*), also known as the piked (i.e., piked or spined) dogfish. It belongs to the family *spinacidae*, of which one characteristic is the presence of a spine before each of the two dorsal fins; and which is further characterized by having spiracles or spout-holes; by having five gill-openings on each side all before the pectoral fins; and by having no anal fin, and no nictitating membrane of the eye. The body is long and tapering; the head flat; the snout conical; the teeth in both jaws sharp-edged, and formed for cutting. The tail-fin is longer than it is broad. The upper parts are slate-gray, the under parts yellowish-white; the skin very rough when rubbed from tail to head, but seeming quite smooth when rubbed in the contrary direction. This fish uses its spines in a remarkable manner, bending itself into the form of a bow, and unbending with a powerful spring; and "if a finger be placed on its head, it will strike it without piercing its own skin." It attains a length of 3 or 4 feet. It is very widely distributed, being found in the Atlantic, the Mediterranean, and

the South seas. It causes great annoyance to fishermen, by cutting the hooks from their lines, and still more by frightening away the shoals of herring, in which other kinds of D. share the blame with it. It sometimes appears in prodigious numbers; 20,000 have been taken in a net at one time on the coast of Cornwall; and the fishermen of the Orkneys and Hebrides sometimes load their boats to the water's edge with them. The flesh, although coarse, is dried and eaten; the livers yield oil, and the refuse parts are used as manure.—The other British dog-fishes belong to the genus *scyllium*, of the family *scylliidae*, which have an anal fin, and two dorsal fins placed far back. They resemble in general form the species just described, and like it, they have the tail-fin longer than it is broad—they have five gill-openings on each side—the last of which, however, is over the base of the pectoral fin. They have spout-holes, and no nictitating membrane; but their teeth are very different, having a long central point, with shorter points on each side. The spotted D. of two species (*S. canicula* and *S. catulus*), both of a generally reddish-brown color, and marked with dark spots, is often taken with bait on all parts of the British coasts; and although almost never brought to market, is much used for food in the Orkney islands. It has been suggested that the fins of these and other sharks might be used for making gelatine soup, as in China.

DOG-FOX, a name sometimes given to certain small animals of the family *canidae*, allied to the *corsac* (q.v.), and, like it, referred to the genus *cynalopex*. They have a sharp muzzle, not unlike that of a greyhound, rather large, erect, pointed ears, the pupil of the eye contracting circularly as in the dog, the tail bushy like that of a fox. They inhabit warm parts of Asia and Africa; and some, if not all of them, burrow.

DOGGER is a vessel something like a galliot or a ketch, used by the Dutch as a fishing-boat in the German ocean. It is not certain whether these were named after the Dogger-bank, or *vice versa*.

DOGGERBANK, an extensive flat sand-bank in the middle of the German ocean, between England and Denmark, in lat. 54° 10' to 55° 30' n., and long. 1° to 5° east. It stretches 320 m. e.n.e., from 12 leagues e. of Flamborough head to within 20 leagues of Jutland. A prolongation runs e. towards Horn Point, Denmark. The bank is in some parts 60 m. broad, but the average breadth is 40. Towards the English coast, it is only 9 fathoms deep, in some parts it is 30, but the average depth is 15 to 20. The surrounding sea is in many parts 24 to 60 fathoms deep. The surface of the bank consists chiefly of fine sand and ooze. It is the seat of important English and Dutch cod-fisheries. At the s. end of D., in 1781, occurred the indecisive naval fight between the Dutch and English fleets, under admirals Zoutman and Parker respectively.

DOGGET'S COAT AND BADGE. These form a prize at a rowing-match on the Thames every year on the 1st of Aug. The prize is a bequest of Thomas Dogget, an actor of Drury Lane theater, who desired to signalize the accession of George I. to the throne (Aug. 1, 1715) by a prize of a waterman's coat and badge. Such is the account usually given; it would appear, however, from the following notice in the *Times* newspaper (Aug. 2, 1861), that there are several prizes rowed for on this occasion. "The first prize is a livery and badge given by Mr. Thomas Dogget, deceased, to which the Fishmongers' company add a guinea. The second and third prizes are respectively five eighths and three eighths of the interest on £260 17s. 3d., formerly £200 South-Sea stock, left in the will of sir William Jolliffe, the amounts respectively being £4 17s. 9d. and £2 18s. 9d. The prize for the fourth man is £1 11s. 6d., and for the fifth and sixth men each £1 1s., the last three given by the company." Besides these prizes, additional sums are occasionally given by private individuals to the winner, or to the first, second, and third in the race. The competition is by six young watermen whose apprenticeships have expired the previous year; each being in a boat by himself, with short oars or sculls. The barge-master of the Fishmongers' company is ordinarily the umpire. The competition takes place when the current of the Thames, by recession of the tide, is strongest against the rowers; and the race, which is from London bridge to the Old Swan at Chelsea, always excites much local interest.

DOG-GRASS. See **COUCH GRASS**.

DOGLIA'NI, a t. of Piedmont, northern Italy, is situated in a mountainous district on the left bank of the Rea, 12 m. n.e. of Mondovì. D. has the remains of an old castle, but no other buildings worthy of note. Here five annual fairs are held, at which cattle, hemp, and victuals are chiefly sold. Pop. 5,000.

DOGMA (Gr.), meant originally an opinion or proposition, put in the form of a positive assertion, its truth being supposed to have been previously shown. In theology, it was understood to signify a doctrine founded on Scripture, and advanced not for discussion but for belief. But as this method of stating truth easily degenerates into the assertion of opinions without ground, and without regard to the aspect they may present to others, *dogma* and *dogmatism* have come in English to be almost synonymous with assertion without proof.

In continental theology, however, the word is still used without implying any censure, dogmas (Ger. *dogmen*) meaning simply doctrines; and this is the case in our own expression, dogmatic theology, or dogmatic, which is that branch of theology that treats

of the systematic arrangement of the doctrines of Christianity. Older names for the same thing were *Loci Theologici* and *Theologia Positiva*.—The first attempt to give a connected view of Christian doctrine was made in the 3d c. by Origen in his work *De Principiis*. He was followed in the 4th c. by Augustine, who in his book *De Doctrina Christiana*, and others, treated of the whole body of doctrine held by the church, though without any very scientific arrangement. The contributions to dogmatic, made in the 5th, 6th, and 7th centuries, were mere collections of "sentences." In the east, in the 8th c., the doctrines of the Greek church were treated by John of Damascus in a form already Aristotelian, and his work may be considered the first systematically-arranged treatise on dogmatic. He makes no mention of purgatory. His book was as influential in the Greek church as the writings of Augustine in the Latin. The regular systematizing of doctrines began with the SCHOLASTICS in the 11th c., but degenerated often into hair-splitting. The first cultivators of dogmatic theology among the Scholastics were Hildebert of Tours and Abelard, who were followed by Petrus Lombardus, Alexander de Hales, Thomas Aquinas, Duns Scotus, etc.

The era of the reformation awoke dogmatic to a new life, leading it back from Aristotle to Biblical theology. But the controversies between the different churches in the 17th c., and the too great importance attached to confessions of faith, cramped anew its freedom, and gave it again a Scholastic turn. Many of our still standard treatises on systematic divinity wear traces of these fetters, and contrast strikingly with the independence and vigor of inquiry displayed in the similar works of Melancthon, Calvin, and other reformers. A fresh revival followed in Germany the spread of the critical philosophy of Kant, when Biblical theology rose up in contradistinction to the theology of confessions, and dogmatic was grounded on the critical interpretation of Scripture rather than on traditional formulas. Hence, however, have sprung widely diverging views. One party still held fast by the existing confessions; another looked chiefly to the contents of Scripture; while a third subjected confessions and Scripture alike to the test of reason. Besides these, there arose in more recent times, a school of dogmatic theologians, formed on the philosophical systems of Jacobi and Schelling, who looked for the essence of religion in the human soul itself, and considered Christianity as the historical revelation of it. Of this school, Schleiermacher, and in some respects Neander and Rothe also, may be considered the representatives; and of all the German schools, it is that which seems to be exercising the greatest influence on the speculative theology of Britain. An important contribution to this department of theology was Peter Lange's *Philosophische Dogmatik* (2 vols., Heidelb. 1849-51). The dogmatic of D. F. Strauss is constructed from the Hegelian point of view, and in its leading results comes back to the system of Spinoza.

It deserves remark that Christian dogmatic and morality, which it had been the custom to discuss separately since the 17th c., have recently been treated in combination by Nitsch and Beck. The scientific investigation of Christian doctrine in Germany has not been confined to the Protestant churches. A number of Catholic theologians have occupied themselves with this branch of sacred science; some, as G. Hermes of Bonn, inclining to freedom of investigation, and others, as Liebermann, to the defense of the usual formulas.

THE HISTORY OF DOGMAS OR DOCTRINES has been raised in Germany to the rank of a distinct branch of sacred science. In this country, the facts with which it deals have received only passing notice in treatises on systematic theology, and in ecclesiastical history have been considered as the "internal history of the church." The pursuit of this branch of inquiry is characteristic of Protestantism; in the Catholic church it is considered as endangering the unity of the faith. Many Protestants even dislike the idea of a "development" of Christian doctrine, which seems to be involved in its having a history. It is not necessary, however, to believe that doctrines hitherto absolutely unknown or denied, came from time to time to be embodied in the orthodox creed of Christendom. See DEVELOPMENT OF DOCTRINE. Though this may be denied, it remains an indisputable fact that the several doctrines came one after the other into prominence in the consciousness of the church; and that in each period of her history there is some one leading doctrine which assumed an importance, as if it were the mainstay of Christianity. To depict this succession or evolution of views with their struggles and modifications, and trace the different ways in which the several doctrines were at different periods formulated and embodied in the creeds, is the object of a history of doctrines (Ger. *Dogmengeschichte*). There is, of course, room for great variety in the method of treating such a subject. Among the most important works on this subject is Neander's, edited by J. L. Jacobi, 1856 (English trans. 1858), and that of F. C. Baur (1847), whose name marks an era in this branch of study.

DOGS, ISLE OF, or *Poplar Marshes*, a small peninsula in the co. of Middlesex, England, formed by a circuitous winding of the Thames, is situated in the vicinity of London, distant $3\frac{1}{2}$ m. e.s.e. from St. Paul's cathedral. It is about a mile long, and three-quarters of a mile broad. In what may be called the isthmus of the peninsula are situated the West India docks. It is said that the Isle of Dogs derives its name from the circumstance that the king's hounds were formerly kept here.

DOGS. See ANDIRON.

DOG-SHORE. See **LAUNCH.**

DOG'S-TAIL GRASS, *Cynosurus*, a genus of grasses having a pretty close spike or ear, each spikelet with two equal glumes and 3 to 5 florets, and beneath each spikelet a comb-like bract or involucre. The species, which are not very numerous, are chiefly natives of Europe and Asia. Two are found in Britain, but one only is common and valuable, the **CRESTED D. G.** (*C. cristatus*), which forms an important part of almost all good pastures, and is particularly esteemed for sheep pastures and lawns, for the improvement of which it is often sown. Its herbage is fine and close, and its deep roots secure it against droughts, which cause many other grasses to wither; but the herbage is not sufficient in quantity to make it desirable for hay. The comb-shaped bract connected with each spikelet of this common grass is a very interesting and beautiful object. The seeds are small, shining and yellow, whence the name gold-seed sometimes given to this grass by farmers.

DOG-STAR. See **SIRIUS.**

DOG-WATCH. On shipboard there are two, usually from 4 to 6, and from 6 to 8 P. M.

DOGWOOD, or **DOGBERRY**, the name usually given to some of the arboreous and shrubby species of the genus *cornus*. See **CORNEL**. The common D. of Europe (*C. sanguinea*), a native of Britain and many parts of the continent, and also of the n. of Africa, is a shrub of 4 to 15 ft. in height, with ovate leaves, and terminal cymes of greenish-white flowers, which have an unpleasant odor. The leaves become of an intense dark-red color before they drop off in autumn. The wood makes the very best charcoal for gunpowder. It is very hard, and is made into skewers for butchers and cooks, and into cogs for wheels. The young wood was, in former times, in request for the making of arrows. The fruit, which is small, dark purple, and very bitter, yields an oil said to be equal to that of the olive, and to the amount of 34 per cent of its weight. This oil is used in France for lamps, and for the manufacture of soap. The D. of North America (*C. florida*) is a small tree, found in the United States, from lat. 43° to Florida, with oval leaves, and small yellowish flowers, which are surrounded by large white roundish bracts. The berries are red, and remain on the tree most of the winter. The flowers appear before the leaves, and their large white bracts are amongst the ornaments of the American woods in spring. The tree attains a height of 20 to 30 ft., with a trunk 8 or 10 in. in diameter. The wood is white, hard, fine-grained, much esteemed and used for inlaying and ornamental work. The bark is very successfully employed in the cure of intermittent fevers. It is also a valuable tonic. It is one of the most valuable medicinal products of North America. The barks of several other North American species of *cornus* possess similar properties. **JAMAICA D.** is *piscidia erythrina*, of the natural order *leguminosæ*, suborder *papilionaceæ*, a good timber-tree, with hard and resinous wood, which lasts well either in or out of water; the bark of the root powerfully narcotic, used for stupefying fish, and also for relieving toothache, being applied to the tooth in the form of a saturated tincture, or taken into the stomach as a powerful sudorific.

DOILEY, or **DOILY**, a small napkin used at table for putting glasses upon during dessert. Some are highly ornamented. The name is said to be derived from the original maker; but more probably it is a modification of the Dutch *doeale*, a towel, and was introduced along with the article from Holland.

DOIT, a small copper coin current in Scotland during the reigns of the Stuarts. It was a Dutch coin (*duit*), and in value the 160th part of a guilder, which, estimated at forty cents, would make the D. equal to the eighth of an English penny, or half a farthing. By some authorities it is said to have been worth only the twelfth of a penny; in reality, it is difficult to say what was its worth, for being imported, like many other coins of the period, from Holland, it would rise and fall in value according to the scarcity of money. The D. must have been common in the early part of the reign of James VI. The kirk-session of Perth (16th April, 1582) "ordains James Sym to give the witch in the telbooth 8 doits in the day" for subsistence.

DOKKUM, a t. in the Netherlands, province of Friesland, lies 12 m. n.e. from Leeuwarden, on the Ee (pronounced *Ay*), which cuts it into two irregular parts. Within the town is a broad haven, suited both for sea-going and inland ships. There are several regularly built streets and many neat houses. The trade in flax, cattle, wool, and chickory is extensive. In the Dokkummerdiep, shrimps are largely taken. Ship-building, gin-distilling, beer-brewing, carding wool, etc., are principal industries. There are a grammar and other good schools. Pop. about 5000.

DO'KOS, a race of blacks in Africa, s. of Abyssinia, almost dwarfs in size. They are in a wild state, and are the favorite prey of slave-stealers.

DOLABELLA, **PUBLIUS CORNELIUS**, b. about 70 B.C.; a Roman gen. of violent and wicked character, often involved in criminal acts, from which he was extricated by Cicero. When 30 years old he drove away his wife Fabia, and married Tullia, Cicero's daughter, against the father's consent. Being heavily in debt he fled from Rome to Cæsar's camp, and took part in the battle of Pharsalus. Returning to Rome, he gained immunity from his debts by securing for himself an election as tribune, and his first legislative act was to propose a law canceling all debts. He was so troublesome in Rome that, to remove him, Cæsar made him a gen. in Africa. Dolabella was ambi-

tious to be consul, and Cæsar promised him the office; but Antony's opposition delayed the fulfillment, and before it could be arranged, Cæsar was murdered. Dolabella at once seized the insignia of office, made friends with the assassins, and was confirmed in the office which he had usurped. He threw down an altar erected to Cæsar, and crucified those who would offer sacrifices upon it. Antony sent him in command of an expedition against the Parthians, where his cruelty and rapacity added infamy to a name already infamous. He tortured Trebonius at Smyrna for two days to force him to disclose the hiding-place of his treasures, and then murdered him. Hearing of this, the senate outlawed Dolabella, and sent Cassius to take his place. Having no further hope of power, Dolabella caused one of his own soldiers to kill him, 43 B.C.

DOLABRA, a rude ancient hatchet. They are represented on the columns of Trajan and Antoninus, and abound in all museums. When made of flint, which was their earliest and rudest form, they are usually called *celts* (q.v.).

DOLCE, an Italian term in music, meaning softly and with tenderness.

DOLCE, LUDOVICO, or LUIGI, 1508-68; an Italian author and a voluminous writer. He translated almost anything and everything from the Greek and Latin, and wrote original works, in all 70 in number. The best known is *Marianna*, a tragedy from the life of Herod, reproduced in French by Voltaire, and still on the stage. He also wrote the lives of Charles V. and Ferdinand I., other dramas, and miscellaneous works.

DOLCI, CARLO, or CARLINO, a celebrated painter of the Florentine school, was b. at Florence in 1616. He received his first instructions in art from Jacopo Vignali, a pupil of Roselli, and a remarkably skillful teacher. After an uneventful life spent entirely in his native city, D. died Jan. 17, 1686. His works, which consist chiefly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character. D.'s drawing is generally correct, his coloring exquisitely delicate and transparent, and in the nicety and laborious care of his finish he approaches the most characteristic examples of the Dutch school. His works are numerous, and scattered over all Europe. Besides his madonnas, the most famous are his "St. Cecilia," "Christ Blessing the Bread and Wine," "Herodias with the Head of John the Baptist," and "Christ on the Mount of Olives." See *illus.*, CORREGGIO, ETC., vol. IV.

DOLCINITES, or DULCINISTS, a sect established in Italy in the 13th c.; they were opposed to the popes, and their doctrines were similar in many respects to those of the spiritual Franciscans. In 1307, Dolcino, the founder of the sect, with some of his followers, was burned at the stake.

DOLDRUMS, a sailor's name for the part of the ocean near the equator, characterized by calms, squalls, and light baffling winds, by which ships are often prevented for weeks from making any real progress. See **WIND**. The name in this application has given rise to the phrase *to be in the doldrums*; i.e., to be dull, listless, or bored.

DÔLE, a well-built t. of France, in the department of Jura, 28 m. s.e. of Dijon. It is delightfully situated on a vineyard slope rising from the right bank of the river Doubs, and the environs are tastefully laid out in gardens and promenades. The principal building is an immense cathedral, named, in honor of the Virgin, *Nôtre Dame*. The chief manufactures of D. are hosiery, tiles, pottery, chemical products, and beer; there are also iron-smelting furnaces, flour-mills, and some trade in corn, wine, wood, marble, and iron. Pop. '91, (commune) 14,253.

DOLE, NATHAN HASKELL, b. Chelsea, Mass., 1852; graduated at Harvard coll., 1874; has translated, edited, and enlarged Rambaud's *Histoire de Russie*, and published an original *Young Folks' History of Russia*, and many translations and works on Russian literature, besides *Not Angels Quite*, *The Hawthorne Tree*, *Rubaiyat of Omar Khayyam* (1896), etc.

DOLE, SANFORD BALLARD, jurist; b. of American parents in Honolulu, Hawaii, in 1844; educated in the United States and Honolulu; admitted to the bar in Boston, Mass.; judge of the Supreme court of Hawaii in 1887-93; became president of the provisional government on the overthrow of the kingdom in 1893, and president of the federal republic established in 1894.

DOLES AT FUNERALS; these are of great antiquity. St. Chrysostom speaks of them as being given to procure rest to the soul of the deceased. On this ground, as well as on the score of general benevolence, the practice of making gifts to the poor at funerals was common until comparatively recent times; for it was continued, sometimes on a munificent scale, long after the custom of praying for the dead had been abandoned on the introduction of reformed doctrines. Nichols, in his *History of Leicestershire*, speaking of Strathern in Framland Hundred, observes of this usage: "In 1790, there were 432 inhabitants, the number taken by the last person who carried about bread, which was given for *dole* at a funeral; a custom formerly common throughout this part of England, though now fallen much into disuse. The practice was sometimes to bequeath it by will; but, whether so specified or not, the ceremony was seldom omitted. On such occasions, a small loaf was sent to every person, without any distinction of age or circumstances, and not to receive it was a mark of particular disrespect." These doles, whether in money or in articles of food and ale, were at one time common not only in England, but in Wales, Ireland, and Scotland; and the custom may be said to have represented, in a simple state of society, that form of benevolence which, in the present

day, consists of bequests to hospitals and other public charities. By some writers, the custom of making doles at funerals is traced to the sin-offering of the Hebrews. See Brand's *Popular Antiquities*, edited by Ellis.

DOLET, ÉTIENNE, 1509-46; a French writer and printer, said to have been an illegitimate son of Francis I. In 1537, he obtained a privilege for ten years to print any works of his own or which had received his supervision. His liberality of sentiment was manifest from his press issues, which ranged from the New Testament in Latin to Rabelais in French. This liberality brought upon him the persecution of the Roman Catholic church, and after long watching he was arrested as a relapsed atheist, put to the torture, and burnt to death; the alleged cause being his insertion in Plato's *Arctichus* of the words "Nothing at all," implying a denial of the immortality of the soul; and yet Plato's book more exactly and positively makes that denial. Dolet was an earnest advocate for the circulation of the Scriptures in the common language of the people.

DOLGELLEY ("dale of hazels"), the capital of Merioneth, North Wales, near the center of the co., and the largest town in it, is situated on the banks of the Wnion, 208 m. n.w. by w. of London. It lies in a rich and picturesque valley, at the foot of Cader Idris, and during the summer months is much frequented by English and foreign tourists. It has manufactures of coarse woolens and flannels. Pop. (1891) 2467.

DOLGORUKY, KATHARINA, PRINCESS, the favorite of the Russian czar, Alexander II., who contracted a morganatic marriage with her in July, 1880, after the death of his wife. After the assassination of the czar she removed to Switzerland, and in 1882 published at Geneva, under the pen-name of Victor Laferté, *Alexandre II., Détails inédites sur sa vie intime et sa mort*.

DOLICHOS, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, closely allied to *phaseolus* (see KIDNEY BEAN), and chiefly distinguished by the extension of the base of the standard so as to embrace the wings of the corolla at their base. The genus includes a considerable number of species, some of them shrubby, some annual, and some perennial herbaceous plants. Some of them have beautiful flowers, and some of the herbaceous species are cultivated on account of their seeds, which afford a kind of pulse; or of their young pods, which, like those of the kidney bean, are boiled for the table. Among these are *D. lablab*, a native of India and Egypt (which has been made the type of a separate genus, *lablab*); *D. Nankinicus* (or *lablab Nankinicus*) a Chinese species; *D. lubia*, a native of Egypt; *D. sesquipedalis*, a native of America; *D. soja* or *soja hispida* (the soy bean), *D. catieng*, and *D. uniflorus* (horse gram), natives of India; *D. sphaerospermus* (calavana or black-eyed pea), a native of the West Indies. In the climate of Britain, even the most hardy kinds require the aid of a little artificial heat, and they are reckoned inferior to other kinds of pulse or garden vegetables of easier cultivation. The well-known Chinese sauce or ketchup called soy (q.v.) is made from the soy bean. Allied to *D.* is the genus *canavalia*, to which belong the SWORD BEANS of India. *C. gladiata*, the commonly cultivated species, has pods 2 ft. long. Another allied genus is *psophocarpus*. The seeds of *p. tetragonolobus*, formerly *D. tetragonolobus*, are used in the Mauritius as peas are in America; and its pods and tuberous roots are common Indian esculents. Some species of *pachyrhizus*, also an allied genus, are remarkable for their tuberous roots, as *p. angulatus* (formerly *D. bulbosus*), a native of India, now cultivated in South America and other warm countries, which produces pleasant turnip-like tubers; and *P. trilobus*, which has tubers 2 ft. long and nearly cylindrical, much used as a boiled vegetable in China and Cochin-China.

DOLICOCEPHALIC, long-headed; a designation of human skulls which have the diameter from front to back much greater than the transverse diameter. Such are the heads of certain Australian and West African races. The opposite conformation is called *brachycephalic*, or short-headed.

DOLINA, a t. of Austrian Galicia, in the circle of Stryi, 60 m. s. from Stryi, on an affluent of the Swica. It has extensive salt-mines. Population of town estimated at 4000.

DOLIUM, a genus of gastropod mollusks having shells spirally furrowed, resembling the hoops on a cask. More than a dozen species are found in the warm seas of the east, and seven fossils are known.

DOLL, an imitative baby used as a toy by girls. The word doll is of doubtful derivation; possibly from *idol*; in French, the name is *poupée*; in German, *puppe*, from Lat. *pupa*, a girl, a doll. The use of dolls dates from the most remote times, and is common in all countries, barbarous as well as civilized, because it springs from that love of nursing and fondling infants which is implanted by nature in the female character. Precisely as a child in a princely mansion in England fondles a finely dressed doll worth a guinea, so does the child of an African or Esquimaux take delight in a piece of wood or bone carved rudely in the form of a baby—in fact, girls in the humbler ranks may sometimes be seen hugging and talking to a bit of stick decorated with a few rags, as if it were a live child. This is not the place to discuss this curious psychological phenomenon; it is enough to say that the love of dolls is a perfectly legitimate feeling, and its exercise helps to cultivate not only tender affections, but taste as regards the making and management of children's dresses. Accordingly, the keeping of a doll becomes a

part of the home education of girls; and is recognized to be so by the universality of the practice.

As in the case of most other toys, dolls were at one time imported into Great Britain chiefly from the Netherlands; and hence not an unusual name for a doll was a Flanders baby. These old Flemish or Dutch dolls were made of wood, with neatly formed faces and flashy dresses, the cheaper kinds having slender wooden legs. Latterly, there have been great improvements in the making of dolls, and in England it has assumed the character of a manufacture; but there are still large importations from the countries on the Rhine, France, and Switzerland. In these continental countries, women and children are mostly engaged in the manufacture. Some carve the heads and bodies, others paint the faces and necks, others prepare legs and arms, and a different class cut out, sew, and put on the dresses. These operations are seldom executed in one manufactory. Usually, dealers buy the fragments so far prepared by villagers, and get them put together in a wholesale way. As the time employed in the preparatory processes is scarcely of any marketable value, the prices of fragments are most insignificant. Hence, as regards all the cheap kinds, with painted faces and ringlets, dolls can be imported at a cost below that at which they could be executed by hand-labor in England. When, however, we come to dolls of a superior kind, with molded wax or composition faces, arms and feet, glass eyes, stuffed bodies, flaxen ringlets, and gauze dresses, the English, by their machinery and capital, carry off the trade. In London there is a considerable number of doll-makers, manufacturing dolls of wax, gutta-percha, india-rubber, etc. In this as in other trades, there is an economic division of labor; there are dolls' head-makers, dolls' leg and arm makers, doll sewers, doll stuffers, dolls' wig-makers, dolls' eye-makers, and doll dressers. For some dresses, remnants of calico, gauze, silk, and other materials, are procured from shops; but for fashionably dressed dolls, much in demand, it is necessary to buy goods on a large scale. The extent to which dolls' glass-eyes are manufactured appears surprising. Some years ago, in evidence before a committee of the house of commons, a glass-manufacturer at Birmingham stated that he had received, at one time, an order for £500 worth of dolls' eyes. The cheaper dolls' eyes are simply small hollow glass-beads, made of white enamel, and colored with black or blue, but without any attempt at variety or effect; while those eyes of a higher quality have a ring of color to represent the iris. The introduction of wires and mechanism to make the eyes move or wink at pleasure, and also to cause the doll to utter the sounds "papa" and "mamma," have been highly appreciated steps in advance, with a corresponding rise in prices. It is stated in the experience of the trade, that since Victoria came to the throne, blue eyes for dolls have been in the ascendant in England; but that black eyes find the best market on the continent, especially for Spanish dolls. Black dolls are made for export to America, where they are in request by girls of negro parentage, and the introduction of gutta-percha is favorable for this branch of the trade. Composition-heads are usually made of *papier mâché*, cast in a mold, and waxed and painted to represent the features.

One of the most attractive stalls at the great exhibition in 1851, was that which contained the dolls of Mme. Montanari, a London manufacturer. Referring to this stall, the jury report said: "It consists of a series of dolls, representing all ages, from infancy to womanhood, arranged in several family groups, with suitable and elegant model furniture. These dolls have the hair, eyelashes, and eyelids separately inserted in the wax, and are, in other respects, modeled with life-like truthfulness." Dolls of the ordinary kinds are manufactured in New York and in some New England cities, but a large proportion of those sold in the United States are imported from Germany, where the principal seat of manufacture is Sonneburg in Thuringia, a town in which doll-making employs a majority of the inhabitants. The "talking-dolls," invented by Edison, in which the phonograph is ingeniously employed, are the latest advance in this branch of manufacture.

DOLLAR is the name of a coin, and the unit in the monetary system of the United States. The origin of the name deserves notice. *Dollar* is a variety of the Ger. *thaler*, Low Ger. *dahler*, Dan. *daler*; and the word came to signify a coin thus: About the end of the 15th c., the counts of Schlick coined the silver extracted from their mines at Joachims-thal (Joachim's valley) into ounce-pieces, which received the name of Joachims-thaler—the Ger. adjective from the name of the place ("Joachims-dalers," as it were). These coins became a kind of pattern and similar coins made in other places took the name dollar. The American dollar is taken from the old Spanish dollar or piastre, and is only slightly less. It was formerly only of silver; but in 1873 the gold dollar was made the unit of value in the United States and the coinage of the silver dollar was prohibited. It was resumed again in 1878 under the Bland-Allison bill. Since 1837, the silver dollar is required to contain 412½ troy grains, the fineness of which is fixed at $\frac{9}{10}$, i. e., $\frac{1}{10}$ of it is alloy. The average bullion value of the silver dollar in 1873 was \$1.004, but since then it has steadily decreased, by reason of the fall in the price of silver, to 52.8 cents during the first 6 months of 1896. The United States gold dollar weighs 25.8 grains or 1.672 grammes and is generally estimated in exchange with Gt. Britain at 4s. 2d. sterling. There have also been coined in silver, *half-dollars*, *quarter-dollars*, *dimes* ($\frac{1}{10}$ dol.), *half-dimes* ($\frac{1}{20}$ dol.), and three-cent pieces. The two latter denominations have not been coined for a number of years. With regard to these, it was enacted in 1853, that the weight of the half-dollar shall be 192 grains, and that of the

others proportional to this; and that such silver coins shall be legal tenders for all sums not exceeding five dollars. The standard gold of the United States is of the same fineness as the silver—namely, $\frac{9}{10}$; and of this are coined double-eagles, eagles, half-eagles, and quarter-eagles, of 20, 10, 5, and $2\frac{1}{2}$ dollars, besides one-dollar pieces. The dollar or thaler in Germany had various values. That of Prussia, which is most current, is equivalent to seventy-five cents. See MONEY.

DOLLAR, a village in Clackmannanshire, on the right bank of the Devon, 10 m. e.n.e. of Stirling. It lies in a plain under the Ochills (q. v.). D. is noted for its academy, founded in 1818 under the will of capt. M'Nab, a native of the parish, who bequeathed £80,000 for the purpose. The academy was incorporated by act of parliament in 1847. The minister and kirk-session of D. were the original patrons and governors, but in 1847 the trust was extended so as to include the lord-lieutenant, vice-lieutenant, convener, and sheriff of the county, the principal of the university of Edinburgh, county gentlemen, two members of the presbytery of Stirling, and two representatives appointed by the parliamentary electors of Dollar. Pop. '91, 2000. Coal mines are worked near by, and lead and copper were formerly mined in the Ochills. A mile n. of D. are the fine ruins of castle Campbell, in a wild romantic situation, on the top of a high almost insulated rock, in a hollow in the bosom of the Ochills, amid mountain rivulets and bosky woods. It long belonged to the Argyle family. John Knox is said to have resided in the castle under the protection of Archibald, fourth earl of Argyle, the first Scotch noble to embrace Protestantism publicly.

DOLLART, TIFE, a gulf of the German ocean, at the mouth of the river Ems, between Hanover and Holland. It is about 10 m. in length by 7 in breadth, and was formed by inundations of the sea, the first of which took place in the latter half of the 13th c., and the last in the 16th century. By these watery inroads a large number of villages were submerged, and thousands of persons perished.

DÖLLINGER, JOHN JOSEPH IGNATIUS VON, one of the most distinguished of Roman Catholic divines of modern Germany, was b. at Bamberg, Feb. 28, 1799. He was educated at Würzburg, where he received holy orders. For a time he was engaged in parochial duties in his native diocese; but having manifested a peculiar fitness for a literary life, he was appointed a professor at Aschaffenburg, whence, in 1826, he was removed to the chair of ecclesiastical history in the newly established university of Munich. From the first he was distinguished as a ready and profound writer. He inaugurated his new professorial career by a work on *The Doctrine of the Eucharist during the First Three Centuries*, in 1826, and a *History of the Reformation*, being a continuation of Hertig's *Handbook of Church History*. He subsequently undertook a new *History of the Church* (vol. i. 1833, vol. ii. 1835), which was speedily translated into French, and also into English, and was carried down to the 15th c.; with a compendium which came down to the reformation (1836-43). His very learned and suggestive essay on *The History, Character, and Influence of Islamism* appeared in 1838, and *The Reformation, its Internal Development and Effects*, in 3 vols., in 1846-48. The design of this work, which consists almost entirely of extracts (connected by a very slight thread of narrative) from the writings of the leading reformers and other contemporary Protestant divines, is to present in the words of the actors in the great religious drama of the 16th c., a picture, doctrinal, moral, social, and political, of the reformation and its results; but as the great body of the authorities (exclusively Protestant) are German, the interest of the work is mainly national.

For a time, D. undertook the chair of dogmatic theology, in which capacity he delivered lectures on "The philosophy of Religion," on "Symbolism," and on "Patristic Literature," none of which, however, have been published. He was a frequent contributor to the *Historisch-politische Blätter*; he published several pamphlets on subjects of occasional interest; and was one of the chief contributors to the Catholic cyclopædia, entitled *Kirchen-Lexicon*, in which his articles on Luther, on Bossuet, and on Duns Scotus attracted much attention. In the politico-religious movement of 1846-47, D. was elected to represent the university of Munich in the Bavarian chamber; but being deprived of his professorship, he became disqualified to sit in the chamber. In the parliament of Frankfurt, in 1848, he was recognized as the leader of the Catholic party. Most of the measures of importance bearing on the relations of church and state which (however ineffectively) were originated in that assembly were prepared or suggested by him. In 1849, he was restored to his professorship at Munich, and also to his place in the Bavarian chamber, which he held till 1852. After that year, he devoted himself entirely to theological literature. His work entitled *Hippolytus und Kallistus* (1853) is a masterpiece of patristic criticism; and his *Heathenism and Judaism, the Vestibule of the History of Christianity*, is a most masterly survey of the religious, moral, and social condition of the world at the advent of our Lord. It was quickly followed by *The First Ages of Christianity*, to which it had been designed as an introduction. During the early discussions on Italian unity, D. delivered an address at Munich, which was represented as hostile to the temporal sovereignty of the pope. In order to explain his real

opinions on that important question, D. published in 1861 an elaborate work entitled *The Papacy and the Temporal Power*, which was partly a comparative survey of the condition of the non-Catholic communions, and of the church, and partly a *résumé* of the history and condition of the papal states; showing that, while the temporal sovereignty was the means providentially established for maintaining the spiritual independence of the papacy, yet it was by no means essential; that the papacy long existed without it, and that even if it were overthrown, Providence would devise another means of attaining the same end. The second part was a criticism of the administration of the papal states, which is understood to have given dissatisfaction to the authorities, as being, although well meant, inopportune, and from this inopportuneess, unfriendly. A similar feeling is said to have been drawn forth by the part taken by Dr. D. in reference to the "Catholic union," some of the principles of which were supposed to trench dangerously upon the province of authority in matters of religious inquiry; but his orthodoxy and learning were unquestioned, and his influence, especially among Catholics of his own nationality, was very great until the approach of the time for the celebration of the council of the Vatican. It being understood that the doctrine of the infallibility of the pope would form a subject of discussion, D. took an active part in organizing an opposition. Articles which appeared in the *Augsburg Gazette*, in Mar., 1869, and which were reprinted more fully under the *nom de plume* "Janus," were ascribed to him or to his influence; and during the discussions of the council, he was entirely identified with the party opposed to the Ultramontane view. On the publication of the decree of the council, which defined the infallibility of the pope in all doctrinal teachings on faith and morals addressed *ex cathedra* to the universal church, D. refused to accept the doctrine. In Oct., and in depreciation of the impending censure of excommunication by the archbishop of Munich, he published an address to the archbishop, in which he claimed to be heard in the synod of German bishops, or before a committee of the cathedral chapter. His declaration on papal infallibility called forth replies from Dr. Hergenröther and others, and was accepted, on the other hand, by the so-called old Catholic party. D. was elected rector of the university of Munich (Feb. 29, 1871) by a large majority of votes. Persisting in his refusal to submit to the authority of the council, he was excommunicated by the archbishop of Munich on the 18th of April, 1871. In 1874, Dr. D. presided over the "old Catholic conference" at Bonn, where he frankly declared that he and his colleagues did not consider themselves bound by the council of Trent. He also introduced a declaration, adopted unanimously, that the eucharistic celebration in the church is not a continuous repetition or renewal of the great propitiatory sacrifice. His literary activity was little diminished. In relation to the prophecy of Orval, and other French prophecies supposed to bear upon the late war with Germany, he published in 1873 an elaborate essay on *Prophecies and the Prophetic Spirit*, which has been translated into English by Alfred Plummer. In addition to his accomplishments in book-learning, Dr. D.'s attainments as a linguist, both in ancient and modern languages, were very remarkable. In 1871, D. received the honorary degree of D.C.L. from Oxford university; and in 1872, that of LL.D. from Edinburgh. In 1872, the king of Bavaria conferred on him the order of merit; and in 1874, the emperor of Germany the order of the red eagle, second class. In 1873 he was appointed president of the royal academy of science at Munich. He d. 1890. See OLD CATHOLICS, and Michael's *Life* (1892).

DOLLOND, JOHN, a distinguished optician, inventor of the achromatic telescope, was descended from a French refugee family, and b. in London, June 10, 1706. His father was an operative silk-weaver, in humble circumstances, and D. was also brought up to that occupation. Engaged at the loom all day, he devoted great part of the night to his favorite studies of mathematics, optics, and astronomy. Not content with these, he turned his attention to the most varied subjects, made himself acquainted with anatomy, and even theology, and went so far in the study of the classical languages as to translate the Greek Testament into Latin. French, German, and Italian also, he knew well. He apprenticed his eldest son, Peter, to an optician; and after the latter had established himself in business on his own account, he was joined by his father in 1752. John D. now devoted himself to the improvement of the dioptric telescope, in which he was encouraged by the most distinguished scientific men of the time. After a series of well-contrived experiments and researches, carried on for several years, he succeeded in constructing lenses that produced images without any colored fringe. See ACHROMATIC. This was undoubtedly the greatest improvement that the telescope had received since its first invention. The memoir (published in the *Philosophical Transactions* for 1758) in which he gave an account of his investigations, was rewarded by the council of the royal society with the Copley medal. In 1761, D. was elected a fellow of the royal society; his death took place on the 30th of Nov. of the same year. His two sons continued to carry on the business with great reputation and success.

DOLLY SHOP, the name popularly given in London to a shop where rags and other kinds of old articles are bought, and over the door of which a black dolly is usually suspended. It is understood that dolly shops are in many instances a kind of unlicensed pawnbroking concerns. For small articles a few pence are given, on the understanding that the seller can buy them back at an advance some days after. In Edinburgh and

Glasgow, shops of this kind are known as *ice parlors*, and give some concern to magistrates and police.

DOLMEN, the name given in France to what British archaeologists call a cromlech (q.v.). The dolmen, properly so called, consists of *one* large unhewn stone resting on two or more unhewn stones placed erect in the earth. But the name is sometimes applied to structures where several blocks are raised upon pillars, so as to form a sort of gallery. One of the most remarkable monuments of this kind is the *Pierre Couvert*, about a mile and a half from Saumur. It is 64 ft. long, about 15 ft. wide, and about 6 ft. high. It has four stones on each side, four on the top, and one at each end. The stone at the e. end has fallen down; all the others appear to be as they were originally placed. Some of them are of great size, one on the roof measuring 24 ft. in length, and more than 2 ft. in thickness. All are of the sandstone of the neighborhood. The floor is unpaved. Dolmen is believed to be a Celtic word, signifying a stone table. The monuments to which the name is given are supposed to be the sepulchers of the ancient Celts or Gauls.

DOLOMIEU, DÉODAT-GUI-SYLVAIN-TANCRÈDE GRATET DE, 1750-1801; a French geologist and mineralogist. He was one of the knights of Malta when a boy, and fought a duel with and killed a brother knight, for which he was condemned to death, but was saved in consequence of his youth. He then turned his attention to science, and visited Spain, Sicily, and the Pyrenees. He minutely described the earthquake in Calabria in 1783, and in later years studied the Alps, where he discovered the mineral "Dolomite," which is named after him. He became professor in the school of mines and a member of the institute from its formation. In 1798, he was on the scientific staff of Bonaparte's expedition to Egypt. Here he lost his health, and on the way home was left at Messina, where he was an object of political hatred because he had revealed to the grand master of Malta the designs of the Neapolitans against that island. He was confined in a wretched dungeon, clothed in rags, and given only a bed of straw. There he was kept 21 months. Denied writing materials, he made a pen from a piece of wood, and with the smoke of his lamp for ink, wrote on the margins of his Bible—the only book he possessed—his *Traité de Philosophie Minéralogique*, and *Memoire sur l'Espèce Minérale*. At the conclusion of the treaty between France and Naples, he was released, and took the chair of mineralogy in Paris, made vacant by the death of Daubenton.

DOLOMITE, BITTER SPAR, or MAGNESIAN LIMESTONE, a mineral consisting of carbonate of lime and carbonate of magnesia in somewhat variable proportions, sometimes nearly equal, the carbonate of lime often greatly preponderating; and usually containing also a little—sometimes nearly 20 per cent—of carbonate of iron. It is softer than limestone; usually white; sometimes gray, yellow, or brown; and occurs compact, cellular, or porous, granular, foliated, and crystallized. Its crystals are usually rhomboidal, and its cleavage is rhomboidal. It is readily distinguished from limestone by its feeble effervescence in acids. It occasionally occurs in veins, accompanied with quartz, calcareous spar, etc., but also as a rock, and forms mountain masses. It is often used as a building stone; the new houses of parliament are built of it. It is also burned and made into mortar, but the lime obtained from it remains much longer caustic than lime from common limestone; and if spread on land in the same quantity, impairs rather than increases the fertility of the soil.—*Brown spar* (q.v.) is a variety of dolomite.

DOLORES, a s. western co. of Col., formed in 1881; 1000 sq.m.; pop. '90, 1498. It is watered by the Dolores river and contains several lofty mountains. Co. seat, Rico.

DOLPH, JOSEPH NORTON, b. N. Y.; was admitted to the bar, 1861; practiced law in Schuyler co., N. Y., 1861-62; was orderly sergeant in the "Oregon escort," 1862; settled in Portland, Oregon, 1862; became city attorney, and dist. attorney, 1864; state senator, 1866, '68, '72, '74; and was elected U. S. senator, 1882 and 1888. He d. in 1897.

DOLPHIN, *Delphinus*, a genus of *cetacea*, the type of a family, *delphinidae*, which is characterized by a moderate size of head—differing in this from the *catodontidae* or *physeteridae* (see CACHOLOT)—and usually by having numerous simple and conical or nearly conical teeth in both jaws, although some of the species lose those of the upper jaw at an early age. The blow-hole is single. The family *delphinidae* includes, along with the dolphins, porpoises, grampus, etc., many animals, which on account of their larger size are very commonly called *whales*, as the beluga or white whale, the caaing whale, the bottlehead, etc. It contains also a few species, which inhabit, not the ocean, but tropical and sub-tropical rivers, as the soosoo of the Ganges and the *inúu* of the Amazon. The true dolphins have the snout prolonged into a rather slender beak, which is not only abruptly separated from the convex forehead, but even by a marked furrow. Both jaws are furnished with numerous equal teeth. The species are numerous, most of them recently discovered, and none of them apparently having the very wide geographical range formerly ascribed to the common D. (*D. delphis*), with which they were confounded. They are very voracious animals, and are said to prey not only on fishes, medusæ, cephalopods, etc., but even on the wounded and feeble of their own species. They live, however, in herds, which often delight the voyager in the ocean solitude by the gambols which they perform around his ship. "They may be discerned at a great distance; as they are con-

tinually leaping from the surface of the sea, an action which, as it seems to have no obvious object, is probably the mere exuberance of animal mirth. When a shoal is seen thus frolicking at the distance of a mile or two, in a few moments, having caught sight of the ship, down they come trooping with the velocity of the wind. When arrived, they display their agility in a thousand graceful motions, now leaping with curved bodies many feet into the air, then darting through a wave with incredible velocity, leaving a slender wake of whitening foam under the water; now the thin back-fin only is exposed, cutting the surface like a knife; then the broad and muscular tail is elevated as the animal plunges perpendicularly down into the depth, or dives beneath the keel to explore the opposite side.

The common D. is found in the Mediterranean and in the northern Atlantic ocean. It is usually not more than 6 or 8 ft. long, but individuals have been seen of 10 feet. The body tapers towards the tail. The tail is crescent-shaped, and about a foot in breadth. The beak is about 6 in. long. The blow-hole is crescent-shaped, with the horns directed backwards. The color is blackish on the back, grayish on the sides, and a satiny glistening white beneath. The female D. brings forth a single young one at a time, which she suckles and nurses with great care. Although an inhabitant of the ocean, the D. emits a peculiar murmuring or suppressed lowing cry. The flesh of the D. was formerly considered a delicacy, and sailors still regard the capture of one as a happy event.

From the form of its beak, the D. receives from the French the names of *bec d'oie* (goose-beak) and *oie de mer* (goose of the sea). It was very differently regarded and designated by the ancient Greeks: it was their *hieros ichthys* (sacred fish), was invested with many fabulous attributes, and was the subject of many mythological legends. It was supposed to be peculiarly friendly to men. It was sacred to Apollo, who was worshiped at Delphi with dolphins for his symbols. The figure of the D. appears on many ancient coins and medals: it is said to have been borne on the shield of Ulysses; it early appeared on the shield of some of the princes of France, and gave its name to one of the fairest of the French provinces, from which the heir-apparent of the French throne came to be styled the dauphin. It is not easy to account for the high regard in which the D. was anciently held; nor is it altogether easy to explain the very general transference of its name in modern times to the coryphæe, a very different creature, remarkable for those changes of color in its dying moments which poets have delighted to celebrate.

Of the other species of D. one only occurs, and that but rarely, in the British seas, the bottle-nosed D. (*D. tursio*), which is said sometimes to attain a length of 24 feet. It appears to belong to the northern parts of the world.

Dolphins not unfrequently enter the mouths of rivers. A D. of the Arctic ocean (*D. leucas*) ascends into the fresh water of the Obi, to prey upon the ascending fishes of various kinds. See *illus.*, WHALE, ETC., vol. XV.

DOLPHIN, BLACK, *Aphis fabæ*, a species of *aphis* (q. v.), or plant-louse, which infests the bean, and often does considerable injury to crops, sucking the juices of the plants and preventing the development of flower-buds. It is of a dull, black, or dark-green color, the young spotted with silvery white. The first that appear are all wingless, but by and by winged individuals are produced, and the pest spreads with great rapidity. It is in the succulent tops of the plants that the aphides first appear, and a common practice of gardeners is to remove the tops in which they are observed.

DOM, or **DON** (from Lat. *dominus*, lord). This title was originally assumed by the popes, from whom it descended, in France at least, to bishops and other dignitaries, and finally to monks. In Portugal, the title *dom* is confined to the sovereign and his family. The Spanish *don* was originally confined to the nobility, but is now bestowed by courtesy as indiscriminately as the English *Mr.* or *gentleman*. The feminine *doña* is, in like manner, given to ladies.

DOMAIN. See DEMESNE.

DOMAT, or **DAUMAT**, JEAN, 1625-96; a French writer, known chiefly from his elaborate digest entitled *Lois Civiles dans leur Ordre Naturel Suivies du Droit Public*, for which Louis XIV. settled upon him a pension of 2,000 livres. The work was published in English in 1722, and has passed through several editions.

DOM-BOC, or **DOOM-BOOK** (book of dooms or sentences, *liber judicialis*), the code of laws compiled by king Alfred, chiefly from the west-Saxon collection of his own ancestor Ina, but comprising also many portions of the Kentish collection of Ethelbert, with the supplements of his successors, and of the Mercian laws of Offa. "Ina's collection," says Dr. Pauli, "was the only one received entire into the Codex, which was chiefly applicable to the condition of the west Saxons. A few articles were admitted here and there from the Kentish and Mercian laws, but research into this matter is not possible, as Offa's book is lost." Alfred made few if any original laws, but contented himself with restoring, renovating, and improving those which he found already in existence. The west-Saxon dialect had become a written language earlier than any of the Teutonic dialects of the continent; and as the power of the clergy in Saxon England

DOMES.—1. Cross-section of capitol dome, Washington. 2. Cross-section of dome of St. Peter's, Rome. 3. Cross-section of dome of St. Paul's, London. 4. Elevation of dome of mosque at Delhi. 5. Cross-section of dome of St. Peter's, Rome. 6. Cross-section of dome of St. Paul's, London. 7. Cross-section of dome of mosque at Delhi. 8. Cross-section of dome of St. Peter's, Rome. 9. Cross-section of dome of St. Paul's, London. 10. Domes from the church of St. Taxiarchis, Athens.

1. Pantheon, Rome. 3. Of dome of the Sorbonne, Paris. 4. Of dome of the Pantheon, Paris. 5. Of dome of the Minster, Aix-la-Chapelle. 8. Ground plan of same. 9. Dome from the Dschamma

was of a more limited kind than elsewhere, the laws of England, up to the period of the Norman conquest, were administered in the vernacular speech of the people. Alfred's peculiarly Christian character is strongly impressed on his code, which begins with extracts from the Bible, "The Lord spake all these words, saying, I am the Lord thy God." Then follow the ten commandments, the part of the Mosaic law relating to criminal offenses, and passages from the New Testament, including the golden rule. Yet it should be observed, that these extracts prove not the *ecclesiastical*, but only the *scriptural* character of the *dom-boe*. The code was ratified by the Witan, as Alfred expressly informs us. In addition to Dr. Pauli's life of Alfred, now published in two English translations, the reader is referred, for information on this subject, to Thorpe's Introduction to Alfred's Laws, in the *Ancient Laws and Institutes of England*, i. p. 58.

DOMBROWSKI (properly DĄBROWSKI), JAN HENRYK, a distinguished Polish gen., was b. 29th Aug., 1755, at Pierszowice, in the district of Cracow. He entered the service of the elector of Saxony in 1770; but in 1792, on the first symptoms of the insurrection in Poland, proceeded to Warsaw. He took part in the Polish campaigns against Russia and Prussia, and exhibited such remarkable military talent, that on the termination of hostilities, Suwarrow offered him employment in the Russian service, and Prussia made him a similar offer. Both were refused, and D. went to France, where, in 1796, he was commissioned by the directory to form a Polish legion among his exiled countrymen, of which he was appointed commander. The legion brilliantly distinguished itself in the Italian campaign. While in Rome, the admirable discipline which D. preserved among his troops, raised him so high in the estimation of the senate, that it presented him with the standards which his great countryman Sobieski had taken from the Turks, when he compelled them to raise the siege of Vienna, and which he had sent to the church of San Loretto. In the campaign of 1799-1800, D. gave splendid proofs of his courage. After the peace of Amiens, D. became a gen. of division in the service of the Cisalpine republic; and after the battle of Jena, along with Wybicki, he was ordered by Napoleon (1806) to summon his countrymen to arms. His entrance into Warsaw, at the head of 12 Polish divisions, resembled a classical "triumph." At Dirschau and Friedland, he won fresh laurels. In the fatal Russian campaign of 1812, he commanded one of the three divisions of the fifth *corps d'armée*, and at the passage of the Beresina, saved from destruction the relics of Poniatowski's corps. In 1813, at the head of his Poles, he took an honorable part in the battles of Teltow, Grossbeeren, Jüterbogk, and Leipsic. After the fall of Napoleon, D. returned to Poland, and in 1815 was appointed by the emperor Alexander a gen. of cavalry and Polish senator; but in the following year he withdrew from public employment to his estate in the duchy of Posen. He died 6th June, 1818.

DOVE (Ital. *duomo*). Though often used synonymously with cupola (q.v.), a dome, in the stricter sense which it has obtained in the languages of northern Europe, signifies the external part of the spherical or polygonal roof, of which the cupola (*cupo*, or cup) is the internal part. In Italian usage, however, it has a wider signification (than even the first, being used to denote the cathedral or chief church of a town, *the house* (*domus*) *par excellence*, or house of God. The cause of the name of the building being thus applied to the form of the roof which covered it, arose from the fact, that the chief churches of Italy were at one period almost universally so roofed. In tracing the historical origin of the D., we are usually in the habit of regarding it as originating with the architecture of the eastern empire, because it was at Constantinople and in the Byzantine provinces that it was first employed in ecclesiastical structures. But it was the Romans who, in reality, were the inventors of the D., as of all the other applications of the semicircular arch. Of their success in applying it to large buildings, we have abundant proof in the ancient domes still to be seen in Rome and its neighborhood. The D. of the Pantheon is still probably the most magnificent D. in existence, and others of smaller size are to be seen in the temples of Bacchus, Vesta, Romulus, Hercules, etc. "From Rome it went to Constantinople, and from the same source, also, came the few insignificant attempts at domes in the western empire."—Fergusson's *Handbook of Architecture*, ii. 943. The peculiar form of the D. of the church of St. Sophia at Constantinople, which became the typical Christian structure of the kind, will be found fully described in the article BYZANTINE ARCHITECTURE. See PANTHEON. The D. of San Vitale, at Ravenna (q.v.), is said to be still more ancient than that of San Sophia, and is a very remarkable structure of the same class. On the church of St. Marco, at Venice, there are no less than five domes, the center one, as is usual, being much larger than the others. The interior of these domes is covered with mosaic (q.v.). So far from being peculiar to the few churches we have mentioned, domes occur in the churches of almost every town along the western shore of the Adriatic, and form, in fact, the chief architectural feature of this side of Italy. The construction of domes in modern times was revived in Rome, by the building of that of Our Lady of Loretto in 1507. But the three most celebrated modern domes are those of St. Peter's (q.v.) at Rome, of St. Paul's (q.v.) in London, and of the Pantheon (q.v.) in Paris. A very complete article on domes, which has been condensed in the *Penny Cyclopædia*, will be found in the *Encyclopédie Méthod-*

ique, under "Architecture." The following are the dimensions of some of the most important existing domes :

| | Feet diam. | Feet high. |
|---------------------------------|------------|------------|
| Pantheon at Rome..... | 142 | 143 |
| Baths of Caracalla, Rome..... | 112 | 116 |
| St. Sophia, Constantinople..... | 115 | 201 |
| St. Maria delle Fiore..... | 139 | 310 |
| St. Peter's, Rome..... | 139 | 330 |
| St. Paul's, London..... | 112 | 215 |
| St. Génévieve, Paris..... | 67 | 190 |

In modern times, domes have been constructed with iron of still larger dimensions. Thus, that of the great exhibition in Vienna was 360 ft. in width, and that of the Albert memorial hall in London, which is oval, measures 219 by 185 ft. in diameter. The D. of the capitol at Washington (see adjoining illus., fig. 1) is composed of two shells, and is the most imposing structure of the kind in the U. S. Its external diameter is 135½ ft. and its height above the roof of the main building 241 ft. The interior diameter is 96 ft., the height 55 ft., and the height from floor to ceiling, 220 ft. The D. of the state-house in Boston is 50 ft. in diameter and 30 ft. high. In Russia domes commonly have a bulbous shape. The Isaac's Church in St. Petersburg has a central D. of Byzantine form, with a diameter of 87 ft. 4 ins., and a height of 275 ft. above the floor, exclusive of the lantern, which is 52 ft. in height. This central D., which is of iron covered with copper, is surrounded by 4 smaller domes—one on each corner of the church. The largest domes constructed on the horizontal principle are those of the so-called treasury of Atreus at Mycenæ, 48 ft. 6 ins. in diameter; and of the tomb of Minyas at Orchomenos. In these, the shape adopted was that of a regular equilateral pointed arch, and the method of construction, the placing of huge stones in horizontal layers, a beehive shape being obtained by the projection of one layer beyond the other, and the structure being held together simply by the superincumbent mass of earth. This Pelasgian form was introduced into India. For a class of ancient dome-roofed structures see BEEHIVE-HOUSE.

DOMENICHINO, properly DOMENICO ZAMPIERI, a celebrated painter of the Bolognese school, was b. at Bologna in 1581, and d. at Rome in 1641. At an early age he began art study under Dionysius Calvaert, but the arbitrary methods of that teacher led to his withdrawal, and he entered the academy of the Carracci. He very soon was the successful competitor for a prize, and this unexpected triumph incited him to more determined efforts. On leaving this academy he repaired with Albani, a fellow-student, to Parma, Modena, and Reggio, for the purpose of studying the works of Correggio and Parmigiano. He then followed his friend to Rome, where Cardinal Agucchi became his first patron. D. made the acquaintance of Annibale Carracci, and on the recommendation of the latter was engaged, together with Guido, to paint the frescoes in San Gregorio. Cardinals Borghese, Farnese, and Aldobrandini employed him, and for the last named D. painted a series of frescoes representing scenes from the life of Apollo. His noted work, "The Communion of St. Jerome," now in the Vatican, was painted soon after, but the praise bestowed upon it increased the animosity of some of his rivals to such an extent that D. returned to Bologna. After a few years he was called back by pope Gregory XV., and was appointed principal painter and architect to the pontifical palace. D.'s frescoes are distinguished by correctness of design, soft delicacy, and freshness of color. The heads of his figures, in particular, are remarkable for expressive force. Of his more important works, the greater number in Italy are in Rome and Florence. Out of Italy, the Louvre possesses the largest number. Several are to be seen in the National and Bridgewater galleries in London.

DOMESDAY BOOK, or DOOMSDAY BOOK, the name of one of the oldest and most valuable records of England, containing the results of a statistical survey of that country made by William the Conqueror, and completed in the year 1086. The origin of the name—which seems to have been given to other records of the same kind—is somewhat uncertain; but it has obvious reference to the supreme authority of the book in doom or judgment on the matters contained in it. It was anciently known by several other names, such as the *Liber de Wintonia*, or Book of Winchester; and the *Rotulus Wintoniæ*, or Roll of Winchester, because it was at one time preserved in the royal treasury in that city; the *Liber Regis*, or the King's Book; the *Scriptura Thesauri Regis*, or Record of the King's Treasury (where it was long kept, together with the king's seal, under three locks and keys); the *Liber Censualis Angliæ*, or Rate-book of England.

The way in which the survey was made will be best described in the words of the contemporary writer in the *Anglo-Saxon Chronicle*. After relating how, in the year 1085, England was threatened with invasion from Denmark and Flanders, and how king William prepared for its defense by laying waste the sea-shores, and by raising the largest army that had ever been seen in the island, "billeting the soldiers upon his subjects, every man according to the land which he possessed," the annalist goes on to say that at midwinter, when the king was at Gloucester, "he had a great consultation, and spoke very deeply with his witan [i.e., great council or parliament] concerning this land, how it was held, and what were its tenantry. He then sent his men all over England, into every shire, and caused them to ascertain how many hundred hydes of land it contained, and what lands the king had in it, what cattle there were in the several coun-

ties, and how much revenue he ought to get yearly from each. He also caused them to write down how much land belonged to his archbishops, to his bishops, his abbots, and his earls, and—that I may be brief—what property every inhabitant of all England possessed in land or in cattle, and how much money this was worth. So very straitly did he cause the survey to be made, that there was not a single hyde, nor a yardland of ground, nor—it is shameful to say what he thought no shame to do—was there an ox, or a cow, or a pig passed by, and that was not set down in the accounts, and then all these writings were brought to him.”

The survey was made by commissioners called the king's justiciaries, who seem to have had the help of the chief men of every shire. By a sworn assize or jury of the sheriffs, lords of manors, presbyters of churches, reeves [i.e., grievers or overseers] of hundreds, bailiffs, and six villeins [i.e., tenants at will] of every village, they made inquest as to the name of the place; who held it in the time of king Edward (1041–66); who was its present possessor; how many hydres there were in the manor; how many homagers or vassals; how many villeins; how many cottars; how many serfs; what plowgates in demesne [i.e., reserved in the lord's own hand]; how many freemen; how many tenants in socage [i.e., tenants by hereditary right]; how much wood, how much meadow and pasture; what mills and fish-ponds; how much had been added or taken away; what was the gross value in king Edward's time; what was the present value; and how much each free-man or soc-man has or had. Of all this there was to be a threefold return or valuation: 1. As the land was held in king Edward's days; 2. As it had been given by king William; 3. As it stood at the time when the survey was made; and the jurors were to say further whether the value could now be raised.

The returns thus gathered in the several shires, and their hundreds and other subdivisions, were arranged and digested in the record which is now called the Great or Exchequer Domesday. The enumeration of the cattle and swine, which so moved the indignation of the Anglo-Saxon chronicler, was omitted from the record, doubtless because the live-stock was altering every month and year, so that an account of its numbers in any one year could not be of permanent importance; but that the enumeration was made, is proved by the records called Little Domesday and the Exon Domesday. These are believed to be transcripts of the original rolls or returns made by the conqueror's commissioners for the counties of Essex, Norfolk, Suffolk, Wilts, Dorset, Somerset, Devon, and Cornwall; and they set forth the number of horses, oxen, sheep, goats, and pigs, together with some other details left out in the compilation of the Great Domesday. The taxes were levied according to the divisions of the country given in the D. B., until 1522, when a new survey, popularly called the *New D. B.*, was made.

The mere statement which has been made of its contents, is enough to show the immense value of D. B. for all purposes of inquiry into the ancient condition of England. “It will ever,” says Dr. Lappenberg, “be found an inexhaustible source of information respecting the Anglo-Saxon and Norman constitutions, particularly the rights and revenues of the kings and their vassals, the relations of cities and towns, statistic accounts of various kinds, families and their landed members, together with innumerable matters highly interesting to inquiring posterity, but unnoticed by the chroniclers of those times, either as too well known or as worthless. An intimate acquaintance with Domesday should supply the basis of every historical account of England, particularly of its special history during the middle age.” No other country of Europe can show such a work. It was fit, therefore, that it should have been the first great English record published at the national cost. It appeared in 1783 in two folios, being printed with types cast for the purpose, so as to represent the contractions of the original manuscript, and having been ten years in passing through the press. In 1816, two supplementary volumes were published, the one containing an excellent general introduction, by sir Henry Ellis of the British museum, with indices of the names of places and of the tenants in chief mentioned in the work; the other containing four other records of the same nature: 1. The Exon Domesday, already mentioned; 2. The *Inquisitio Eliensis*, a record closely resembling the Exeter Domesday, containing the survey of the lands of the monastery of Ely, in the counties of Cambridge, Hertford, Essex, Norfolk, Suffolk, and Huntingdon; 3. The Winton Domesday, containing two surveys of the city of Winchester, one made between 1107 and 1128, the other in 1148; and, 4. The Boldon Book, a survey of the possessions of the see of Durham, made in 1183. This last work is especially valuable, as partially supplying a deficiency in the survey for D. B., which did not extend to the counties of Durham, Northumberland, Westmoreland, and Cumberland, either, it would seem, because they had been lately laid waste by the conqueror, or because his dominion was not fully established in them. A new and better edition of the Boldon Book was issued in 1852 by the Surtees society, which, in 1857, printed *Bishop Hatfield's Survey*, another record of the possessions of the see of Durham, compiled between 1345 and 1381. A new and enlarged edition of sir Henry Ellis's *General Introduction to Domesday Book*, was published in 1833, in 2 vols. 8vo. See also Stubbs' *Select Charters*, and Freeman's *Norman Conquest* (vol. v., 1876). In 1861, a fac-simile copy of that part of D. B. which relates to Cornwall, was published by the ordnance survey, as an example of what can be done by the new process of engraving called photozincography. This experiment proving successful, government has gone on publishing the rest of the D. B., county by county, in the same way.

In 1872, government ordered a general return of owners of lands, to be prepared by the local government board. This new "Domesday Book" was published in 1874-76.

DOMESTIC ANIMALS are those which, in order to turn them to his use, man has tamed or reduced in a greater or less measure from their natural wildness, and which he makes the objects of his care, and in a living state his property. Many animals are useful to man, which he has never thus appropriated. Such are the deer and other game which the hunter pursues, and fishes generally, whether of the sea, lake, or river. Man has not yet found it possible to domesticate them, or has not found it necessary or desirable to do so. Individuals, indeed, of some species may have been domesticated, and become very tame, but these are exceptional instances. In general, those only are called domestic animals which have existed from one generation to another in a state of domestication. Of almost all of them, domesticated races exist, considerably different from any that are now found in a state of nature; the peculiar circumstances in which they are placed by domestication exercising a modifying influence, like that of cultivation in plants. Domestic animals mostly belong to the classes of mammals and birds. Of mammals, those which have been domesticated are exclusively of the common quadruped form, and mostly herbivorous. The greatest number, and these among the most important, belong to the order of ruminants; some of them being valuable for their flesh, their milk, their hair or wool, their hide, etc., or as beasts of burden and of draught, some even on all these accounts. To this order belong the ox, buffalo, and yak, the sheep, the goat, the reindeer, the camel, and the llama and alpaca. Of other herbivorous quadrupeds, the most important are the horse and ass, the elephant and the hog. Of the elephant, however, although for many ages it has been much employed for various purposes in India, no domesticated race exists; the individuals which man reduces to his service being still taken as at first from among the wild denizens of the forest. Domesticated races exist of two comparatively unimportant quadrupeds of the order of rodents, the rabbit and the cavy or Guinea-pig.—Of carnivorous quadrupeds, there are only two which have been generally and thoroughly domesticated, the dog and the cat. The uses to which these animals are destined are very different from those in order to which herbivorous quadrupeds are kept in a domestic state. Analogous to one of the uses of the dog is that to which the cheetah or hunting-leopard is applied by some of the princes of India, but, like the elephant, it is only individually domesticated. The same remark may be made concerning some other animals—the otter, the civet, etc.—which in different countries are tamed or kept in confinement to meet certain purposes for which man finds it convenient to employ them. The domestication of the ferret is rather more complete.—Of birds, the most important domestic species belong to the gallinaceous order, and to the family *anatidæ* among web-footed birds. To the former belong the common domestic fowl, the turkey, the peacock, the Guinea-fowl, etc.; to the latter, the goose, duck, etc. Of other birds, none can be said to be truly domesticated, except, perhaps, one or two species of song-birds, particularly the canary. The birds used in falconry are domesticated only in the same sense as the cheetah; but it is not uninteresting to observe that man has been able to make both birds and beasts of prey his servants.—Reptiles are quite capable of being tamed, and in some countries some of them are occasionally kept in houses for killing flies, or even for killing mice and rats; but none of them can be enumerated among domestic animals. Nor, perhaps, can any species of fish be so regarded, although artificial ponds have long been in use, and some species of fresh-water fish are to a certain extent the objects of care and of a kind of culture on the part of man.—In the lower divisions of the animal kingdom, only a few species ever receive such culture, or in their living state are claimed by man as his property. All these belong to the class of insects—viz., two or three species of bee, two or three species of silk-worm moth, and two or three species of cochineal insect. These may perhaps more fitly be described as *cultivated* than as *domesticated*. See **DOMESTICATION**.

Many animals not yet domesticated might probably be added with advantage to the number of domestic animals. Adaptation to particular climates and situations might probably be found to recommend species allied to those in which great part of the wealth of mankind has long consisted, and from which still more of it has been derived. It is not impossible, also, that as the waste places of the world become peopled, animals already becoming scarce may be advantageously domesticated on account of their fur or other products for which they are now pursued by the hunter.—The principal domestic animals, however, of the present day have been domestic animals, and highly valued as such, from time immemorial. We have no record of the domestication of the ox, the horse, the camel, the dog, etc. Even the llama and alpaca, although known only to the inhabitants of the Andes and adjacent regions, were found in a state of domestication there when South America was first visited by Europeans, and their subjection to man is probably to be referred to the earliest periods of Peruvian civilization. The limitation of some domestic animals to particular countries and climates—of which we have notable instances in the camel of the Asiatic deserts, the reindeer of the arctic regions, the yak of the steep and snow-clad Himalaya, the buffalo of tropical marshes, and the South American quadrupeds just mentioned—forbid us to suppose that all the important domestic animals were domesticated by the same people and at the same

period, or that they have all spread in a state of domestication from a common center or source. Yet there are many circumstances which point to the same Asiatic region as that in which the greater number of them were first domesticated, which is commonly regarded as the cradle of the arts and sciences, and even of the human race.

DOMESTIC ARCHITECTURE. The external forms and internal arrangements of the domestic abodes of a people are far more influenced by their manners, habits, and occupations, and by the climate in which they live, than their ecclesiastical edifices and public buildings; and there is, consequently, no department of architecture which is so varied and national as domestic architecture. But not only are the circumstances of each country different in this respect—the same is the case with every department of each country, with every town in each department, with every street in each town; and a D. A. which fulfills its object, will not only adapt itself to the necessities, but will make the best, in point of artistic effect, of the specialties of every case with which it is called upon to deal. The circumstances of families, and even the tastes and fancies of individuals, are legitimate subjects of consideration in domestic architecture. To attempt to give to D. A. the beauty of uniformity, is consequently to mistake both its object and the source from which its charm is derived. When attained at all, uniformity is attained not in accordance with, but in defiance of, the utilitarian objects of domestic architecture. The results of this artistic falsehood may be seen in the monotonous and meaningless streets and squares that have been built in all our principal towns during the last eighty years. The legitimate charm of D. A., because the only one which can arise from the complete fulfillment of its object, is the charm of variety. It is the charm which our ancestors sought during the whole of the great architectural period of the middle ages, and which our architects, who in this, as in so many other respects, are returning to their principles, are now beginning to cultivate. But here, as in all similar cases, it must be borne in mind that, in general, it is the principle alone that can be revived, and that the details by which it was carried out can be legitimately copied only in the exceptional cases in which circumstances and the objects to be attained remain unchanged. The position of an American in the 19th differs in many respects from that of an Englishman in the 14th c.; and to construct for the former a house in all respects resembling that which was constructed for the latter, would be to commit an error the same in kind as if we had sought for either of them a model dwelling in Pompeii or Canton.

In no country in the world, probably, are dwellings so comfortable, so picturesque, and so well adapted to the climate as in the United States, the abundance of material, especially of wood, allowing the architect great latitude. Although no strictly original style of architecture can be evolved, certain distinctive features, such as the broad piazza, have become fixed, and the Greek temple and the Gothic castle having been discarded as unsuitable models, a pleasing regard to the history of localities is now shown, such as the return to colonial types in the Atlantic states, and to Spanish in Florida and California.

DOMESTICATION, the modification of animals by deliberate human interference with their food and surroundings, with the work or functions they perform, but especially with their breeding. The influence of man on animals extends, however, far beyond those usually regarded as domesticated, and it is not possible to draw a perfectly hard-and-fast boundary line. Man has exterminated some animals—e.g. birds, and propagated others—e.g. fishes; he has made many become rare, shy, and cunning, while others—e.g. crickets, find shelter in his dwellings; he has kept some captive, like the fish in the pond; tamed others individually for his service, like falcons and cheetahs; he has preserved some artificially from their enemies, because of their rarity, and others because of their utility, but without in any of these cases much modifying them. None of these are in the strict sense domesticated. It is only when a distinct breed has been produced by human interference—in most cases, deliberately by artificial selection—that we are justified in calling the result D. Strictly “domesticated animals” correspond to strictly “cultivated plants;” in both cases, the organisms have been modified, more or less fixedly, from their natural or wild state, by changes in food, environment, function, and breeding.

D. began long before the dawn of history (see AGRICULTURE; ANTHROPOLOGY; DOG). The domestic animals are discussed under separate articles, but a list of representative forms may be given here. Among lower animals, silk-moths (see SILK) and hive bees (q.v.) have been for long controlled, and, to a limited extent, modified. Among fishes, gold-fish (q.v.) may certainly be regarded as domesticated for decorative purposes. Birds include many illustrations of D.—pigeons, fowls, ducks, geese, peacocks, turkeys, guinea-fowls, canary-birds, etc. Among mammals, dogs and cats, horses and asses, cattle, sheep, and goats, elephants, camels, reindeer, pigs and rabbits, etc., have been domesticated, and have given rise to many different breeds. The complete list is not a long one, though it will probably be increased. To admit of D., animals must generally be social and docile in their habits, and must be capable of retaining fertility under changed conditions.

The process of D., as far as deliberate control is concerned, is for the most part equivalent to selective breeding. Forms with useful varieties are isolated from the mass, and allowed to breed together, the most desirable results are again selected for breeding, and so on, till a domesticated breed of the same animal is established (see BREED). Different

breeds differ from natural species in being usually mutually fertile. In other words, while two domestic races may be externally more different than are two nearly related species in nature, the reproductive elements in the first case cannot differ as they must do in the second. Thus crossing is usually successful between domestic breeds; only rarely between adjacent natural species. When we pass beyond selective breeding to inquire into the conditions of variation, a much more difficult problem is raised. In regard to some changes which crop up in domestic animals, we cannot do more at present than refer them to variations in the unstable germ-cells, and to the intermingling of sexual reproduction. Where the intercrossing is regulated, the importance of the latter is especially obvious. These germinal changes may, however, as the organism grows, find expression in the continually variable rhythm between nutrition and reproduction, between growth and multiplication—the great antithesis of organic life. But while considering this internal aspect, we have at the same time to recognize the importance of external influences, especially of altered climate and diet. These hinder or abet the constitutional or inherited tendencies, and may in course of time bring about important new results.

Lastly, it must be remembered how much the habit of life, the normal functions, the daily work of the organisms, are often altered under D. Some parts are more used, others less; and this is also a source of change (see SPECIES). Domesticated forms are more variable than their wild relatives; the males are more variable than the females; and the offspring of hybrids are more unstable than the hybrids themselves. The results of D. are very varied. Sometimes the changes induced and cultivated have been comparatively slight; in other cases they have amounted to the evolution of new species. Superficial alterations of color and skin, hair and feathers; deeper changes in the less plastic skeletal, muscular, alimentary, and other systems; increased fertility on the one hand, sterility on the other; alteration in mental and emotional characters; the perfecting of a racial characteristic in one case, its loss in another; general progress in some forms, utilitarian degeneration or extraordinary abnormality in others, are abundantly illustrated in Darwin's classic work on variation under D. The constant tendency to atavism (q.v.) or reversion; the danger of carrying selection of a given character too far; the limits of successful close breeding (see BREED); the bearing of facts of D. on the problems of heredity (q.v.) and evolution, are discussed elsewhere. See ACCLIMATE; CULTIVATED PLANTS; SPECIES; and Darwin, *The Variation of Animals and Plants Under Domestication* (1868).

DOMESTIC MANAGEMENT, financially considered, may be defined as the art of making a given income go the furthest possible in procuring for a family the means of living—the word living being understood in its wider and higher sense. It being assumed, as a fundamental maxim, that the outlay shall be within the income, the leading object of the art is rightly to apportion the outlay among the different requisites. How this is best to be done, can be discovered only by large experience; and if a young housekeeper were to begin her career without some indications of the path she should follow, she must fall into serious mistakes, occasioning loss and discomfort. Not that any amount of previous instruction, whether written or oral, can give the skill of experience; but attention to some of the more important maxims may help to avert very serious errors while the lessons of experience are being learned.

It is a very safe rule, that the best quality of food is the cheapest in the end; "it goes further"—i.e., it gives more nourishment; but those who require to practice economy may, by going to market themselves, purchase good meat at a cheaper rate than they would if they sent for it, from reasons known to experienced buyers, such as the pieces they select not being called prime cuts, not being so well-shaped, etc., which in no way takes from the wholesomeness of the article. Again, good cooking renders things more digestible and nourishing; bad cooking is absolute waste, to say nothing of the injury it does to the stomach. How meat is rendered tender by boiling or broiling, without having its nutritive qualities extracted, is described in the articles **BOILING** and **BROILING**. For the time necessary for roasting, baking, stewing, and frying, good instructions are given in the very useful works, *The Dictionary of Daily Wants*, and Mrs. Beeton's *Book of Household Management*, where not only the mode of cooking, but the actual cost of each dish, is given.

Some books on housekeeping recommend that coal should be bought when cheap, and that groceries should be purchased in large quantities; but this is open to objections, that coal occupies a larger space than can be spared in small houses; that many articles of grocery waste in quantity or deteriorate in quality by keeping, as sugar, which loses weight, and tea, which loses aroma; and that both coal and grocery in masses, are apt to be wasted by servants, children, and thoughtless persons, from the circumstance of having large quantities to go to. Groceries may be bought cheaper in this way, and it is only personal experience that can decide in every case as to their being really cheaper. Candles and soap are the chief things that certainly improve by keeping. Candles should be hung up, if dips, but molds should be stored in boxes, and covered and kept in a dry place. Soap bought in bars, in as dry a state as possible, should be cut in lumps, six to the bar, and laid on shelves, to harden slowly.

A thorough knowledge of the art of choosing material for clothing, and making and cleaning articles of apparel, is also highly necessary, and, like good marketing for food,

can only be acquired by practice. Many things must be considered in this kind of purchase: the evenness of the threads in cotton and linen fabrics, softness of texture, freedom from what is called "dress." In printed goods, the same rule is to be observed as to evenness of weaving, in addition to which, those kinds should be selected that have the pattern printed through, so as to show on the wrong side, and of a lilac or dark-blue color, as being the best for washing. Flannel goods should be chosen for their regular make, good width, and softness; and flannel articles should be made larger and longer than necessary, to allow for shrinking when washed. Good patterns for making from should be obtained, well-fitting and appropriate dress lasting longer and looking better than what is put together in an inconsiderate, slovenly manner; a clever needlewoman, like a clever cook, is the most truly economical one. The same remarks apply to furniture chintzes and linens for sheetings, etc.

DOMETT, ALFRED, C.M.G., 1811-87; statesman and poet; b. in Surrey, England. He entered St. John's coll. in 1829, but left in 1833 without a degree. In 1833 he published a vol. of poems, and from 1837-39 contributed verses to Blackwood's Magazine, one of which, "A Christmas Hymn," has attained great popularity. In 1839 a second vol., a poem on Venice, was published. In 1841 he was called to the bar at the Middle temple; in 1842 purchased land in New Zealand and emigrated to that country, his intimate friend, Robert Browning, lamenting his departure in a poem entitled "Waring." D. became colonial sec. for New Munster in 1848; sec. for the colony of New Zealand in 1851; commissioner of crown lands and resident magistrate at Hawke's bay, 1853-56; member of parliament for Nelson in 1855; prime minister in 1862; sec. for crown lands, legislative councillor, and commissioner of old land claims in 1864; registrar gen. of land in 1865, and administrator of confiscated lands in 1870. He returned to England in 1871. The friendship of D. and Browning is celebrated in the latter's *Guardian Angel*. D. pub. *Ranolf and Amolia, a South Sea Day Dream* (1872); *Flotsam and Jetsam* (1877), dedicated to Browning; and (while in New Zealand) several official publications.

DOMETT, Sir WILLIAM, K.C.B.; G.C.B., 1754-1828; b. England; admiral; entered the navy in 1769; in 1777 was made lieut., and took part in the action off Ushant, July 27, 1778; under Capt. Cosby, in the action off Cape Henry, Mar. 16, 1781, and in the action of the Chesapeake, Sept. 5, 1781. Becoming signal officer under sir Samuel Hood, he served in the operations against St. Kitts, Jan., 1782, and in the action off Dominica, Apr. 12, 1782. A few days afterwards he captured 4 of the enemy's vessels, was promoted to the command of one of them, and subsequently was advanced to post rank and appointed as flag-capt. to Rear-Admiral Hood, aiding in the relief of Gibraltar. After being employed on the coast of Scotland, in the West Indies, and Newfoundland, he served as flag-captain 1790-1800; in 1801 was appointed capt. of the Baltic fleet; next, capt. of the fleet off Brest; in 1804 was appointed rear-admiral; aided in revising the civil affairs of the navy; in 1808-13 was on the board of admiralty; was made vice-admiral in 1809 and admiral in 1819.

DOMICILE, in common speech is used as synonymous with home or place of abode; in the strict legal sense it denotes the place which the law will hold to be a man's residence. Vattel defines one's domicile as his habitation fixed in any place with an intention of *always* staying there. This definition is now regarded as too strictly limited by most authorities on international law, certainly by the best writers on the subject in the United States. It is held that in a comparatively newly settled country like this absolute permanence of residence is rare, and it is sufficient to constitute a domicile that the habitation be fixed without any present intention of removing therefrom. Justice Story says, "Two things must concur to constitute a domicile—first, a residence, and, second, the intention of making it the home of the party"; to which Dr. Woolsey—undoubtedly the best authority among American writers on international law—adds, "and when once a domicile is acquired it is not shaken off by occasional absences for the sake of business or pleasure, or even by visits to a former domicile or to one's native country." It follows that the same person may be a citizen of one country, possess a domicile in another (for the questions of domicile and citizenship are quite distinct), and temporarily reside in still a third. Another American authority, Wharton, distinguishes three kinds of domicile: domicile by birth, by choice, and by operation of the law. The first is decided by the place of nativity, the second is acquired by a man's own volition, and an illustration of the third is the domicile of a wife, being that of her husband acquired by her at the time of marriage. A child, of course, has the domicile of his parents and is considered incapable of changing his domicile of his own accord; but he follows, of course, any change in the domicile of the parents. When the father of a family dies, the domicile of his children and widow continue to be that of his last residence until a new one is acquired in any of the ways already indicated. The question as to what amounts to a sufficient intention of permanent residence to cause an immediate change of domicile is one of no little difficulty, and which must be determined by evidence and the special facts of each case. In its relation to legal actions and rights the rule may be laid down in a general way that the law of the place of domicile governs in contracts relating to personal property and in the matter of wills and bankruptcy, while on the contrary in matters relating to real estate the law of the place of its situation (*lex rei sitæ*) prevails. In England it was

formerly held that it was necessary to the validity of a will that it should be executed according to the law of the testator's domicile, no matter where the will was drawn; but statutes now provide that the will is valid if it were executed in accordance with the law of the country where it was made, even though it do not conform to the law of the place of permanent and recognized domicile. Similar provisions exist in most or all of the states in this country. The question of domicile is often of importance in determining property rights in time of war. Thus it is held that the property of an alien domiciled in a country with which his own nation is at war is subject to seizure as that of an alien enemy. Under a strict construction of the common law, also, an alien cannot (without regard to the existence of war or peace) hold land, either by purchase or inheritance; but in many of the American states this rule has been directly abolished by statute as opposed to the natural policy of this country, and in others it has become obsolete by general consent. Under the Roman or civil law it was considered that a man might legally hold two domiciles, as when he resided part of the year in one place and part in another, or when he maintained two businesses in separate places; but the laws of the United States and England do not recognize such an idea. In matters of taxation and in the application of the poor laws the term domicile is often used, sometimes loosely, and its definition is often of importance in deciding such matters; the courts will often in such questions give the word the more restricted meaning attached to the words dwelling place, home, or residence. It has been held by several American courts that the domicile of a sailor is the place where he voluntarily spends most of his time when on shore.

DOMINANT, in music, the fifth above the tonic: the ruling or governing tone of the key. Ancient writers called the D. the *quinta toni*, from its being the next in importance to the tonic. The D. chord is always a major chord, the third being the *subsemitonium modi*, or leading note, which always rises a semitone to the tonic. The D. seventh is the major chord with the flat seventh above the D., and is the same in major and minor keys. The rules for the treatment of the D. seventh, and for the chord of the ninth on the D., apply to all other chords of the seventh or ninth, which arise from the other degrees of the scale. The D. seventh is a most important chord in modulation. The resolution of the D. seventh is always into the chord of the tonic, when not interrupted. The D. as a key is the nearest in relation to the tonic. Modulation into the key of the D. is so frequent in composition, that its form may be said to be stereotyped. The subdominant, or under-dominant, stands next in importance to the D., and has its place on the fourth above the tonic, or, which is the same, on the fifth below. The chord of the subdominant is major or minor, according to the mode of the key. The chords on all other degrees of the scale being either minor or diminished, give greater importance to the major chords of the tonic, D., and subdominant, in which chords all the notes of the scale are found, while the combination of these chords, giving the most perfect impression of a key, may account for their being of such importance in harmony.

DOMINANT TENEMENT. See **SERVITUDE**.

DOMINGO, SAN or SANTO, a maritime city of Hayti, capital of a province of the same name, and of the republic of San Domingo or the Dominican republic, stands on the s.e. coast, at the mouth of the Ozama, in lat. 18° 29' n., and long. 69° 57' west. It is the oldest settlement of European origin in America, having been founded in 1496 by Bartolommeo Columbus. The pop. numbered (1892) 14,150. The city contains the government buildings, churches, including a cathedral, which is supposed to contain the remains of Christopher Columbus, convents, hospitals, colleges, and a light-house, etc. The streets are broad, and intersecting at right angles. The chief trade is in timber and dye-woods. The name S. D. is sometimes applied to the whole island of Hayti. See **HAYTI** and **DOMINICAN REPUBLIC**; also **SAN DOMINGO**.

DOMINIC, SAINT. See **DOMINICANS**.

DOMINICA, or **DOMINIQUE**, a British West India island, lies in lat. 15° 18' n., and long. 61° 24' w., containing about 290 sq. m. It is of volcanic origin, hot and sulphureous springs still attesting the fact. It is the loftiest of the Lesser Antilles, attaining at one point, an elevation of 5314 ft., and nearly one-half of the surface consists of precipitous mountains and deep ravines. Where capable of cultivation, the soil is fertile; and, even on apparently inaccessible sites, the emancipated negroes have successfully established provision grounds. The principal productions are sugar, coffee, cocoa, cotton, lime-juice, molasses, rum, tamarinds, sulphur, indigo, rose-wood, and other cabinet woods. The principal industry is sugar planting. It has great natural resources, but the population, according to the census of 1891 was only 26,841, while in 1881 it was 28,211, and the exports for 1893 and subsequent years showed a falling off. In 1893 an inquiry was made into the causes of the industrial depression in the island. The result of this investigation was the alteration of the government in such a way as to place more power in the hands of the British administrative officer. The government consists of this officer or administrator, of an executive council, and of an assembly consisting of 7 elected and 7 nominated members. The chief harbors are Roseau on the western coast, and Prince Rupert Bay on the northern coast. The population consists principally of natives. The whites are chiefly Catholics of French descent. There were, in 1891, about 300 of the aboriginal Caribs. The abolition of slavery worked well

in Dominica. In 1839 the planters at a public meeting acknowledged, "with feeling of unmixed gratification, the peaceable and quiet disposition evinced by the laborers, as a body, since their entire emancipation;" and in 1852 the lieutenant-governor officially adverted to the prosperity and contentment of the same class. The temperature, according to season and altitude, ranges from 88° F. down to chilliness; and even in the dry months, from Feb. to Aug., rain frequently falls. D. was discovered by Columbus, on his second voyage, in 1493, on a Sunday (whence its name Dominica, i.e., the Lord's day), being then thinly inhabited by Caribs. From the commencement of the 17th c. to the middle of the 18th, it may be described as having been a neutral island; but in 1759 it was captured by England, and permanently ceded by France in 1763. In 1802 it again came into the possession of France, but was finally handed over to England in 1814.

DOMINICAL LETTER, or **SUNDAY LETTER**, is one of the seven letters A, B, C, D, E, F, G, used in almanacs, etc., to mark the Sundays throughout the year. The first seven days of the year being marked in their order by the above letters in their order, then the following seven, and all consecutive sets of seven days to the end of the year, are similarly marked; so that the 1st, 8th, 15th, 22d, etc., days of the year are all marked by A; and the 2d, 9th, 16th, 23d, etc., by B; and so on. The days being thus marked, it is evident that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays in the year, as the number of the letters and of the days in the week is the same.

As the common year consists of 52 weeks and one day over, the dominical letters go backwards one day every common year. If the D. L. of a common year be G, F will be the D. L. for the next year. As a leap-year consists of 52 weeks and two days, the letters go backwards two days every leap-year. If in the beginning of a leap-year the D. L. be G, E will be the D. L. for the next year. This extraordinary retrocession, however, is made to take place at the intercalary day (the 29th Feb.) by the artifice of marking it by the same letter as the day preceding it, and thus the next Sunday is marked by the letter preceding that which marked the Sundays before the intercalary day. Suppose the 28th Feb. in a leap-year to be a Sunday, and marked by F, it is evident that the D. L. for the rest of the year will be E. As every fourth year is a leap-year, and the letters are seven in number, it is clear that the same order of letters must return in four times seven, or 28 years, which would, but for the leap-years, recur in seven years, and hence the solar cycle (see **PERIOD**). The dominical letters were first introduced into the calendar by the early Christians, to displace the nundinal letters in the Roman calendar. They are of use as a means of discovering on what day of the week any day of the month falls in a given year. See **EASTER**. Rules and tables for finding them are given in prayer-books, breviaries, etc., as well as in works on dates. See **DATE**.

DOMINICAN REPUBLIC, a state formed of the Spanish or e. section of Hayti (q.v.). Spain, in 1697, surrendered to France, by the treaty of Ryswick, the w. part of the island, retaining the remainder down to 1795. In the year last mentioned, however, the Spanish portion became nominally French. In 1814—the west having vindicated its independence—France formally relinquished, in favor of Spain, all claim to the east. In 1822, the colony, in imitation of the continental possessions, threw off the yoke of the mother-country, to link itself, more or less closely, with its African neighbors. But in or about 1843, it assumed a separate standing as the Dominican Republic, the anarchy of which it exchanged in 1861 for the despotism of its former masters. But in 1865, having again revolted, Spain gave up the possession, and the republic has since maintained a troubled existence. The D. R. has an area of 18,000 sq. m., nearly two-thirds of the area of the whole island. Its principal productions are sugar, cocoa, bananas, and coffee. Its pop., chiefly negroes and mulattoes, was estimated (1888) at 610,000. Estimates in 1893 placed it at 550,000. The capital, San Domingo, contains 14,150 inhabitants. See **SAN DOMINGO**.

DOMINICANS, an order of preaching friars in the Roman Catholic church (*fratres predicatorum*), founded at Toulouse in 1215 by Dominic (Domingo) de Guzman. Dominic was born at Calahorra, in Old Castile, in 1170. He studied theology at Palencia, and in 1199 became canon and archdeacon of Osma in Castile. In 1205, along with his superior, Diego de Azabes, bishop of Osma, he began to itinerate through the s. of France, for the purpose of converting the "heretical" Albigenses; and convinced that the ignorance of the people and the worldliness of the clergy were great helps to the progress of heresy, he instituted the order which bears his name, for the express purpose of preaching and the cure of souls. Dominic, however, found it impossible to convert the Albigenses by this method, and therefore had recourse to another. In 1208, at the instigation of Dominic, the pope proclaimed a crusade against these "heretics;" the barons of France were summoned to take part in it, and headed by De Montfort, committed horrible slaughter on these unfortunate people. The order of the D. was confirmed by Innocent III. and Honorius III. in 1216. The members followed

the rule of St. Augustine, somewhat modified; their dress was a white garment, resembling that of the Carthusians, with a black cloak and pointed cap of the same color. In 1220 they took the vow of poverty. Dominic died at Bologna in 1221, and was canonized by Gregory IX. in 1233. He is said to have been ordinarily not a cruel or unfeeling man, but his religious passions were so vehement, that they entirely dried up the milk of human kindness in his heart, and his conduct towards heretics was merciless in the extreme. As early as 1206, he founded an order of Dominican nuns, which, after 1218, when the first convent was established at Rome, spread far and wide. These nuns followed the same rule as the friars, and were solemnly pledged to habits of industry. A third Dominican order (the Knights of Christ) was established in 1224, and confirmed in 1279. It was originally a company of knights and nobles who had leagued themselves together for the suppression of "heresy" by force of arms, but after the death of its founder, the order was changed into that of the *Penitents of St. Dominic*. The members of this branch of the D. were also called the Tertiary Dominicans. They were not bound by any vows, but their special duties were to observe particular fasts and devotions, and to execute great ecclesiastical judgments. They retained all their civic and domestic privileges. There were also *female Penitents of St. Dominic*, a few of whom, however, betook themselves to a conventual life, and became nuns. These few were chiefly in Italy; the most famous was St. Catharine of Siena. The glory of apostolic poverty, which encircled the D., the privileges which they possessed—especially of preaching and hearing confession—and the circumstance that as early as 1230, only 15 years after the foundation of their order, they secured a chair of theology in the great university of Paris, all helped to rapidly increase their numbers and influence. Within *six* years after their establishment, they had spread to England through one Gilbert du Fresney, and founded a monastery at Oxford. "The monks," writes a contemporary annalist, Matthew Paris, himself a Benedictine, "did not, in three or four hundred years, ascend to such a height of greatness as the friars, minors and preachers, within twenty-four years after they began to build their first house in England." Their progress was scarcely less rapid in Scotland, where they found a munificent patron in king Alexander II., who is said to have met St. Dominic at Paris about the year 1217. In Britain, the D. were called the *Black Friars*. In France they received the name of Jacobins, from the Rue St. Jacques (Lat. *Jacobus*) in Paris, where they first established themselves. Their monasteries arose throughout all Christendom, and were even to be seen on the shores of Asia, Africa, and subsequently America. Their monarchical constitution, which bound all the branches and congregations of the order under one grand head (*magister ordinis*), insured their progress and the co-operation of their efforts to secure influence in church and state. Through their preaching and proselytizing, it is undeniable that they exercised, at the time of the foundation of their order, and for a considerable time after, an influence alike extensive and beneficial. They have produced several great scholars and men of genius, such as Albertus Magnus; Thomas Aquinas, the normal theologian of the Roman Catholic church; and Raymond de Penafort. They have, however, acquired a black reputation in history in connection with the inquisition (q. v.), in which they were the chief agents. After 1425, when they obtained permission to accept endowments, they in some measure refrained from begging, and engaged themselves more with politics and theology. Their great rivals were the *Franciscans* (q. v.), and the mutual animosity of the two orders was strongly exhibited in the disputes of the Thomists and Scotists. These two orders divided between them the honor of controlling the church, and often the Catholic states of Christendom, until the rise of the Jesuits in the 16th c., who gradually drove both from the schools and the court, when the D. were compelled to return to their original vocation. Their power was, however, again revived to a certain extent in 1620, when the censorship of books was conferred on the master of the Vatican at Rome, who must always be a Dominican. In the 18th c., the order of D. possessed 1000 monasteries and convents, divided into 45 provinces, besides 12 separate congregations or sects. At present, the order flourishes only in Italy, France, Hungary, Switzerland, and America. The Dominican nuns, who are not numerous, have convents in Italy, France, Belgium, Hungary, Bavaria, and America. See *illus.*, PRIESTS, MONKS, AND NUNS, vol. XII.

DOMINION, THE OLD. See STATES, POPULAR NAMES OF.

DOMINIS, MARCUS ANTONIUS DE, an ecclesiastic whose career was both singular and checkered. He was b. in 1566 at Arba, on the coast of Dalmatia, and educated, first at Loretto, and subsequently at Padua, where he greatly distinguished himself both by his ability and the varied character of his studies. While at Padua, he taught mathematics, physics, and eloquence. Having completed his theological curriculum, he was, after some time, appointed bishop of Segni, and two years later, archbishop of Spalatro, in which capacity, however, he quarreled with the pope, and having, moreover, exhibited certain Protestant leanings, he found it expedient to resign his post. In 1616, he came to England, where he was hospitably received. King James appointed him dean of Windsor; and while holding this office, he wrote his *De Republica Ecclesiastica*, a work in which he endeavored to show that the pope had no supremacy over other bishops, but was only *primus inter pares*. D. published one or two other productions between 1617 and 1618; but finding Anglicanism far from satisfactory, a revulsion of feeling occurred, and D. once more looked and longed for the unity of the Catholic

church. The motives that induced him to return to the Roman Catholic church are not known. Most writers consider that he was actuated by avarice and ambition, but a critical appreciation of his character would lead us to doubt this harsh judgment. He was, it has been supposed, desirous of discovering a church broad enough to form the basis of a universal Christianity. Men holding such opinions are always misunderstood, and so D., even after his return to Rome, was still suspected of heresy. In consequence, he was imprisoned in the castle of St. Angelo, where he died, Sept., 1624. Being subsequently condemned as a heretic, his body was raised from its grave, and burned.

While at Padua, D. wrote his *De Radiis Visus et Lucis in Vitris Perspectivis et Iride* (Venice, 1611). He was the first to point out that in the phenomenon of the rainbow, the light undergoes, in each rain-drop, two refractions and an intermediate reflection.

DOMINIUM, a Roman law-term, which has been received into the technical language of most of the legal systems of Europe. It may be described as a full legal right in and to an object—as the right from which alone legal possession could flow, but which actual possession alone could never confer, unless such possession had endured for the period of legal prescription. The right to possess is thus distinguished from the right arising from possession, which is the usufruct. Ownership or D. may be either absolute—that is to say, it may include the beneficial interest in the subject—or it may be bare ownership, consisting in some limited power over it at the time, or some ultimate right to it at a future time. D. must not be confounded with *imperium* (q.v.), which has a totally different signification.

DOMINO, the name formerly given to the garb worn in winter by priests while officiating in cold edifices. It is now used to signify a masquerade costume, consisting of an ample cloak or mantle with wide sleeves. See **MASQUERADE**.

DOMINOS, the name of a game, usually played with 28 oblong, flat pieces of ivory or bone, etc., each of which bears two numbers marked by points from nought to six. The party wins who has first played out his tablets, or, if this has been found impossible, who has the fewest points on the tablets still remaining. The game of D. has been attempted to be traced back to the Greeks and Hebrews, and also to the Chinese. So much is certain, that it was introduced about the beginning of the 18th c. from Italy into France, where it immediately became popular in the larger towns. From Paris it spread to Germany, where, as in France, it is now played in every coffee-house. The Café de l'Opera, in Paris, long boasted of assembling the most expert players; an honor, however, which was warmly contested by the establishments of Rouen and Poitiers.

DOMINUS, the Latin word by which we commonly render lord, but which more properly signifies master, as opposed to slave (*servus*). Aurelianus is said to have been the first emperor who adopted D. as a title of honor on his medals, though it had long been made use of in conversation and in correspondence in that sense, as by Pliny in addressing Trajan. In legal phraseology, the *dominus litis* is the person really interested in the issue of an action, though not necessarily the pursuer.

DOMITIANUS, T. FLAVIUS, emperor of Rome from 81 to 96 A.D., was the son of Vespasian, and younger brother of Titus, whom he succeeded on the throne. The earlier years of his reign were on the whole advantageously occupied for the public benefit. Many good laws were passed, the provinces carefully governed, and justice rigidly administered. As he grew older, however, his ambition, his jealousy, and his pride, wounded by the failure of his campaigns against the Dacians and the Marcomanni, in 87 A.D., began to instigate him to the most atrocious cruelties. By murder or banishment, he deprived Rome of nearly every citizen conspicuous for talent, learning, or wealth. To win the army, he greatly increased the pay of the soldiers, and secured the favor of the people by prodigal largesses and gladiatorial shows and games, in which he sometimes took part in person. His cruelties became at length so intolerable, that a conspiracy—encouraged, if not organized—by his wife Domitia, whom he had doomed to death, was formed against him, and the tyrant fell under the dagger of the assassin, 18th Sept., 96 A.D.

DO MO D'OS SOLA, a charming little t. in the extreme n. of Piedmont, at the foot of the Simplon, near the right bank of the Tosa, which flows into Lago Maggiore. Its general aspect is peculiarly Italian. It has some trade and several handsome buildings, but is chiefly noteworthy as being a starting-point for tourists who wish to make excursions up the southern valleys of the Alps. The chief places of interest in the vicinity are the Val Anzasca, the Val Vigizzo, and the Falls of the Tosa. Population between 3000 and 4000.

DON (anc. *Ta'nais*), a river of Russia, has its source in a small lake in the government of Tula, in lat. about 53° 45' n., and long. 38° 10' east. It flows at first in a south-eastern direction through the governments of Tula, Riazan, Tambov, and Woronetz, and after winding s.w. through the country of the Don Cossacks, it advances to its embouchure in the sea of Azov, which it enters by three mouths, only one of which is navigable. The D. receives 80 affluents, of which the principal are the Sosna and the Donetz on the right, and on the left the Khoper, the Medveditsa, the Sal, and the Manitch. Its total length is about 1150 miles. Its course is obstructed by frequent

sand-banks, which, when the water is low, render navigation impossible to any but flat-bottomed boats. From April to June, however, during which months it overflows its banks, and forms unwholesome swamps on either side, it is navigable as high as Zadonsk, 600 m. from its mouth. The D. is connected by a canal with the Volga, and by this means the produce and manufactures of the interior are conveyed to the southern provinces of Russia. The waters of the D. abound in fish, the traffic in which commodity is considerable, especially in its lower course.

DON, a river of Aberdeenshire, rising on the w. border of the county in a peat-moss, 1640 ft. above the sea. It runs n.e., then e., and lastly s.e., entering the sea a mile n.e. of Old Aberdeen. It has a total course of 78 m., but only 42 in a straight line, and it drains a tract of 495 sq.m., chiefly composed of granite and gneiss, with a little syenite and clay-slate. In the upper part of its course, it receives some large mountain streams, but its chief tributary is the Ury, which comes 24 m. from the n.w. Near the junction of the Ury and D. is a curious conical gravel hillock, called the Bass, the subject of a prophecy by Thomas the rhymers. The D., at less than a mile from the sea, is crossed by the old "brig o' Balgownie," of one Gothic arch. Lord Byron, while a youth, had a superstitious dread in crossing this bridge, from an old prophecy connected with it.

DON, a title. See **DOM**.

DON, or **DUN**, a river of the West Riding of Yorkshire, rising in the moors on the borders of Derbyshire and Cheshire. It runs 55 m., first s.e. to Sheffield, and then n.e. by Rotherham, Doncaster, and Thorne, into the Aire, which soon afterwards unites with the Ouse. Its basin consists of carboniferous and permian strata. Its chief tributaries are the Rother, Dearne, and Went. It is navigable for the last 39 m. of its course below Sheffield, by the aid of artificial canals and cuts.

DO'NA, **SAN**, a t. of n. Italy, in the province of Venice, 18 m. n.e. from Venice, on the left bank of the Piave. Pop. of commune, 8500.

DONÑA AÑA, a co. in New Mexico, on the border of Texas and Mexico, intersected by the Rio Grande, and by several mountain ridges; about 8992 sq. m.; pop. '90, 9191. The productions are wheat, corn, wool, and live stock. Co. seat, Las Cruces.

DONA FRANCISCA, a German colony, situated in the province of Santa Catharina, Brazil, about 14 m. inland from the port of São Francisco, was founded about 1867, and its population is estimated at 6700. Chief town, Joinville or Dona San Francisca, with about 3000 inhabitants.

DONABUE, a t. of Pegu, stands on one of the main branches by which the Irrawaddy enters the bay of Bengal, lat. 17° 10' n., and long. 95° 27' e. It is within the delta of this grand artery of the country, and is situated 65 m. to the n.w. of Rangoon, and 54 to the n.e. of Bassein, the principal seaports of the newly acquired British province. It is only on historical grounds, however, that the place is worthy of notice. Here the English were repulsed with considerable loss in both the Burmese wars; first in 1825, and again in 1853.

DONAGHADEE', a seaport in the n. of the county of Down, on the Irish Channel, 18 m. English (14 Irish) e.n.e. of Belfast, and 22 m. s.w. of Portpatrick, Wigtownshire, with which it is connected by a submarine telegraph cable. It forms a crescent round the harbor, with two chief streets, one facing the sea, and is frequented for sea-bathing. Its exports are cattle, grain, potatoes, etc. It has a lighthouse which can be seen for twelve miles. Pop. '91, about 2000. On the n. of D. is a conical mound, 140 ft. high, 480 ft. in circuit at the base, and surmounted by a modern miniature castle 50 ft. high, whence there is a very extensive prospect, including the Scotch coast and the Isle of Man. The Danes, in 837, are said to have destroyed a university which stood on a level a little s. of where D. now is.

DONALDSON, **JAMES LOWRY**, b. Md., 1814; graduate of West Point; served in the Florida and the Mexican wars, and in the war between the states, in all with distinction, rose to be maj.-gen. in 1865, and in 1869 retired from active service. He wrote *Sergeant Atkins*, a tale of the Florida war. He d. in 1885.

DONALDSON, **JOHN WILLIAM**, was b. in London, June 7, 1811. His father, Stuart Donaldson, a wealthy merchant, was descended from an old Scotch family; his mother was daughter of J. Cundall, esq., of Snail Green, Lancashire. He was educated first at the university of London, and afterwards at Trinity college, Cambridge. He graduated as B.A. in the year 1834, and obtained the second place in the first class of the classical tripos. The year following he was elected fellow. His first work was a volume, entitled *The Theater of the Greeks*, partly original and partly compiled, which, having been carefully revised and improved in six successive editions, still holds its place as a school and college class-book. He was still resident at Cambridge, holding the office of assistant-tutor of Trinity, when he published the first edition of his *New Cratylus* (1839), a work remarkable for its research, erudition, and boldness, and as being the first attempt, on a large scale, to familiarize Englishmen with the principles of comparative philology, as established by the great scholars of Germany—Pott, Bopp, Grimm, and

others. Availing himself largely, but not servilely, of the labors of these men, he developed their principles, and continued their researches, with a special application to the history, structure, and etymology of the Greek language. The *New Cratylus*, in its latest, largest, and most improved form, is still the most important work which has been written in English upon the subject. Mr. D. soon after married the daughter of sir John Mortlock of Stapleford, and accepted the post of head-master of the grammar-school of Bury St. Edmunds, having previously taken holy orders. Notwithstanding the engrossing nature of his duties as head-master, he found time to prosecute and extend his linguistic studies, embracing in their wide range Hebrew and Arabic, and most of the dialects of modern Europe. In the *Varronianus*, of which the first edition appeared in 1844, he undertook to accomplish for Latin philology what in the *New Cratylus* he had done for Greek. He dedicated the work to the bishop of St. Davids (Dr. Thirlwall), in grateful recognition of the benefits derived from his Cambridge teaching. Among his other works of this period may be mentioned an edition of Pindar, of the *Antigone* of Sophocles (with a verse translation), *Maskil le Sopher* (a treatise on Hebrew grammar), and finally *Jashar*, a book written in Latin, and published at Berlin, the object of which was, by critical tests, to distinguish the fragments of the lost book of *Jashar* imbedded in the Pentateuch. This book was violently assailed by the so-called "religious press," which did not prevent its undaunted author from issuing a second edition.

Soon afterwards he resigned his place at Bury St. Edmunds, and returned to Cambridge, where he gave a course of lectures on Latin synonyms, and occupied himself with tuition. Here he wrote a volume entitled *Christian Orthodoxy*. Some critics vehemently disputed its right to the title. A smaller volume on classical scholarship followed. He had previously issued a *Greek Grammar* and a *Latin Grammar* for the use of schools. These, during his residence at Cambridge, he recast and enlarged, so as to rival in profundity and copiousness any other works on the same subjects. In 1856, he was appointed one of the classical examiners in the university of London, an honor which he owed chiefly to the strenuous report of Mr. Grote, the historian of Greece.

He was engaged in superintending the compilation of a new *Greek Lexicon*, when his health, for the first time, began to show symptoms of failure. A tour in Germany during the summer of 1860 did not produce any change for the better. Incipient disease of the brain, the result of overwork, showed itself first by neuralgic pains, and afterwards by more alarming symptoms. He removed to London, and died in his mother's house, after some weeks of great suffering, borne with calm and patient courage, on the 10th of Feb., 1861. In private life, he was distinguished by kindness of heart, ready wit, unfailing vivacity, and varied conversational powers. It ought, perhaps, to be mentioned that a little work, published anonymously under the title of *Phile-leutherus Anglicanus*, which made no small sensation at the time of its appearance, has been very generally attributed to Dr. Donaldson.

DONALDSON'S HOSPITAL, an extensive establishment at Edinburgh, of the character of Christ's hospital, London. Its founder was James Donaldson, a successful printer in Edinburgh, son of Alexander Donaldson, publisher, of whom some notice is taken in the articles **BOOK-TRADE** and **COPYRIGHT**.

DONATELLO (properly, DONATO DI BETTO BARDI), one of the restorers of the art of sculpture in Italy, was b. at Florence, in 1383. He belonged to the Donato family, which reckons several scholars among its members, and has given some doges to the republic of Venice. *Donatello* was a diminutive given to the artist in childhood. He received his earliest instructions from Lorenzo Bicci. His first great works in marble were the "St. Peter" and "St. Mark" in the church of St. Michael in his native city. His own favorite, however, was the statue of an old man in the garb of a senator, on the steeple of the same church. It is known under the name of *Zuccone* (the gourd or bald-head). He died at Florence, Dec. 13, 1466. D.'s principal works, besides those already mentioned, are a statue of "St. George" (in marble), "Judith bearing the Head of Holofernes" (in bronze), the "Crucifixion" (in wood), several statues of the "Baptist" (executed in various materials), and a grand equestrian statue (in bronze) of Erasmus Gattamelata, erected on one of the public places of Padua. He also executed a number of bas-reliefs. The whole tendency of D.'s genius was towards a reproduction of the antique; and his style, though not free from harshness and the rudeness of early art, sometimes reminds one of the glorious productions of ancient Greece.

DONA'TI, GIOVANNI BATTISTA, 1826-73; an Italian astronomer, professor in the royal institution at Florence. June 2, 1858, he discovered the comet now bearing his name. He discovered other comets, made spectroscopic observations, and published diagrams of lines in the spectra of the stars. In 1864, he was appointed director of the Florence observatory.

DONATION. In legal usage the word donation is confined to the transfer of personal property made without consideration; but the word gift is also used to denote a particular kind of transfer of real estate—that by which there is created an estate in *fee tail*, an estate, that is, which is granted to a man and certain particular heirs; the instrument by which such a transfer is made is called a deed of gift. Title to personal property can thus be acquired only through the voluntary, positive, and gratuitous act of the owner, followed by the distinct acceptance of the donee. The general classifica-

tion of gifts of personal property is twofold ; *donatio inter vivos* (a gift between the living) denotes the ordinary kind of gift, which goes into effect at once and has no reference to future events ; in this last particular it is distinguished from *donatio mortis causa* (a gift because of—that is, in expectation of—death). This last form of gift is usually intended to avoid the necessity of making a will when circumstances render that impossible or difficult ; only personal property can pass in this way ; the transfer must be made when the death of the donor appears imminent, there must be actual or constructive delivery of the property, and the gift takes effect only upon the death of the donor. The gift, therefore, is really a conditional one and may be revoked upon the death of the donor. A gift *inter vivos*, on the contrary, is absolute, and not revocable. All kinds of personal property are subject to these two forms of gift, including even a *chose in action*, that is, property of which the owner has not the actual possession but the right of possession, and which he may reduce to possession by legal action. Such a right, in case of its gift to another must be transferred by a duly executed written assignment. The only cases when a gift of personal property *inter vivos* is revocable are when they are prejudicial to the legal rights of creditors, when the donor is legally incapable of making the gift, or when the transaction is vitiated by fraud. The phrase *donatio propter nuptias* (a gift on account of marriage) was used in the civil or Roman law to designate the sum paid by a husband as the offset to the wife's dowry ; this was considered partly as jointure for the wife in case of her survival, partly as security for the return of the wife's dowry to her heirs if she survived her husband. It is a general rule of law that a donation is not to be presumed ; unless, that is, there is specific evidence to the contrary it will be assumed that the transfer of valuable property was made in expectation of a reasonable return ; thus the support of a child by a relative not his parent will render any estate which he may possess or come into liable for compensation ; and it has even been held that under special circumstances a father may maintain a claim for the expense of sustaining his child where the latter possesses a separate estate. The principles of the common law in regard to donations, as above briefly enunciated, are followed closely by the statutes and decisions of England and the United States. A special use of the word donation in this country is in the term *donation lands*, which were certain lands set apart by the state of Pennsylvania after the Revolution, in the northwest part of its territory, as a gift to its citizens who had served in the Revolutionary army.

DONATION OF CHARLEMAGNE was a gift made by Charlemagne to Pope Adrian I. in A.D. 774, of his conquests in Italy. It was also a confirmation of the Donation of Pepin (q.v.), but the extent and general conditions are not known.

DONATION OF CONSTANTINE was a forgery of uncertain date but probably published about 750 A.D., professing to be a gift in the year 324, of Rome and Italy from Constantine to Sylvester I., then Pope. The fraud was exposed by Laurentius Valla.

DONATION OF PEPIN is a term used to designate a gift made by Pepin, father of Charlemagne, to Pope Stephen in A.D. 755. Pepin was the first Frankish king whose election and consecration received the pope's sanction, and he also consecrated him anew in the church of St. Denis in Paris. In return for this Pepin was soon called upon to assist the pope in maintaining his temporal sovereignty. This he did by marching into Italy at the head of a large army against the Lombard king, Astolphus, whom he compelled to raise the siege of Rome, to abandon the city and exarchate of Ravenna, and also several cities that had formerly belonged to Greece, the keys of which he presented to the pope.

DONATI'S COMET, discovered June 2, 1858. It was nearest the earth Oct. 10, when its apparent length, 51,000,000 m., made it a sight of wonderful magnificence. Its distance in aphelion is estimated at 15 billions m., and its return to the solar system is not expected till the year 3808.

DONATISTS were the followers of Donatus, a Numidian bishop who opposed the election of Cecilianus in 311 A.D. to the bishopric of Carthage, on the ground of the ordination having been performed by one who had been a traditor, or traitor—that is, one who, during persecution, had given up the sacred books to the pagan authorities ; and also because Cecilianus had exhibited great hostility towards the victims of the late persecution. After some time, the council of Arles (Aug. 1, 314 A.D.) decided against Donatus, who in a short time seceded from the Catholic church, and formed a distinct sect, which, by 330, had 172 bishops in northern Africa. The D., like the followers of Novatian (q.v.), went upon the principle, that the essence of the true church consisted in the purity and holiness of all its members individually, and not merely in its apostolical and Catholic foundation and doctrine. They therefore both excommunicated all lapsed and gross offenders, not receiving them again but on being re-baptized, and also held that the efficacy of the sacraments depended on the worthiness of the administrator. Driven to fanaticism by the oppression of the secular power, they not only denied to the state all right to meddle with ecclesiastical affairs, but bands of Donatist ascetics collected, attacked the imperial troops (348), and continued to devastate Mauritania and Numidia for a dozen years. In the beginning of the 5th c., they seem to have almost

equaled the Catholics in number, and the eloquence of Augustine and these verities of Honorius were exercised upon the sect in vain; they continued to exist as a separate body. But by adopting a more prudent plan of proceeding, the Catholic bishops had, by the end of the 6th c., induced most of those that had left to return to the bosom of the church; and in the 7th c. the D. were extinct. Donatism is regarded by Neander (see *Dogmengeschichte*, translated into English by J. E. Ryland: Bohn, vol. ii. page 394) as a reaction against that form of Catholicism, "which conceived the church to be an outward organism, continued by the succession of bishops, who formed the necessary medium of communication with Christ, and for partaking in the Holy Spirit and salvation." "Whoever is shown to be a Christian in a right and lawful manner, is to me a Catholic," was a saying of the D.; while the church in general, guided by Augustine, wished to let the worthy and unworthy remain mixed together, and to defer the separation to the final judgment." Thus, while the D. had the merit of superior strictness of theory, it must be acknowledged that their views were less practical than those of their opponents.

DONATUS, ÆLIUS, a well-known grammarian and commentator, who taught grammar and rhetoric at Rome about 355 A.D., and was the instructor of St. Jerome. He wrote treatises, *De Literis; Syllabis; Pedibus et Tonis; De Octo Partibus Orationis*; and *De Barbarismo; Solecismo*, etc., the best edition of which is in Lindemann's *Corpus Grammaticorum Latinorum* (vol. i.). These writings form together a pretty complete course of Latin grammar, and in the middle ages were the only text-book used in the schools, so that Donat came, in the w. of Europe, to be synonymous with grammar, or with the elements of any science. The *Donat into Religion* is the title of a book by an English bishop, and there was an old French proverb, *Les diables estoient encore à leur Donat* (The devils were yet in their grammar). The Latin grammar of D. has formed the groundwork of the elementary treatises on that subject to the present day. D. was one of the first books on which the art of printing by means of letters cut on wooden blocks was tried, and copies of these Donatuses are reckoned among the greatest of bibliographical curiosities. The author also wrote a commentary on Terence, of which we possess only a part extending to five comedies, to be found in the edition of Terence by Klotz (2 vols., Leip. 1838).

From this D. we must distinguish a later grammarian, **TIBERIUS CLAUDIUS DONATUS**, from whom we have a very worthless life of Vergil, prefixed to many editions of that poet, and fragments of a commentary on the *Æneid*.

DO NAUWÖRTH, a t. of Bavaria, situated at the confluence of the Wernitz and the Danube, about 25 m. n.n.w. of Augsburg. It is well built, in the form of an amphitheater, round the side of a hill, and is surrounded by walls. It was formerly a free imperial city of considerable importance, but it has declined in population, which in 1890 was only 3733. It is historically interesting, however, as the main cause of the thirty years' war; the severity of the punishment meted out to the inhabitants in 1607, in consequence of their adoption of the reformed doctrines, and their assault on a Roman Catholic procession of the "Host," having led to the formation of the Protestant league, and Catholic union, the opponents in that long and severe struggle. It is likewise associated with the name of Marlborough, who stormed and carried the intrenched camp of the Bavarians here in 1704. Also, on the 6th Oct., 1805, the French, under Soult, obtained a victory here over the Austrians, under Mack.

DO NAX, a genus of lamellibranchiate mollusks, of the family *tellinidæ*, with shell of two equal valves, which close perfectly, and are of a triangular form, prettily striated from the beak to the margin, the beak occupying the obtuse angle of the triangle. The species of D. are generally small. Several are found on the British coasts. The fossil species are not numerous, and belong to the eocene formation.

DON BENITO, a t. of Spain, in the province of Badajoz, 55 m. e. of the city of that name. It is situated near the left bank of the Guadiana, and is in general well built, with wide and tolerably clean streets. It has several squares, the chief of which is lined with the principal structures in the town, including the town-hall, prison, and a convent; and in the center is a public promenade. D. B. has manufactures of woolens, wine, and oil, and its proximity to the Guadiana affords it great trading facilities. Pop. 1887, 16,287.

DON CARLOS. See **CARLOS**.

DONCASTER, a municipal borough in the West Riding of Yorkshire, on the right bank of the Don, on the Great North road, 35 m. s. of York. The country around is flat, but beautiful. Fine old elms line the broad and level road from the south. D. is very clean and well built. The High street is a mile long. It has manufactures of iron, brass, sacking, linen, and agricultural machines. Its corn-market is one of the largest in the kingdom. Pop. '91, 25,936. D. was the ancient *Danum*, and lay on the Roman road from York to Lincoln. Roman coins, urns, and a votive altar have been found here. It was the *Dona Castre* of the Saxons. The Saxon Northumbrian kings had a palace here. D. was burned by lightning in 759, and frequently ravished by the Danes. It has long been famous for its annual races, begun in 1703, and held a mile s.e. of the town in the second week of Sept. Col. St. Leger, in 1776, founded stakes

which have been yearly run for by the best horses in England. On an eminence 5 m. w.s.w. of D. are the ruins of Conisborough castle, a Norman-Saxon round tower, 37 ft. in diameter and 86 ft. high, with walls 15 ft. thick, strengthened by square buttresses reaching the whole height. The door is arrived at by an external flight of 37 steps, and within is a cylinder open to the heavens.

DON COSSACK, a government in Russia in Europe, n.e. of the sea of Azov, on the river Don; 61,886 sq. m.; pop. '95, 2,222,755. The country is generally level and sandy, and the climate mild, though in winter there are sometimes very cold and severe storms. Cattle-raising is the principal business; hemp and flax are raised, and wine, salt, and caviare are among the exports. Seat of government, Novo-Tcherkask.

DONDRA HEAD, the most southerly extremity of Ceylon, is in lat. 5° 55' n., and long. 80° 38' east. As compared with cape Comorin, the corresponding point in the peninsula of Hindustan, it more directly faces the Indian ocean, and lies nearer the grand thoroughfares of eastern commerce.

DONEGAL, a seaport in the s. of Donegal co., at the mouth of the Eske, on a shallow creek of Donegal bay, 11 m. n.n.e. of Ballyshannon. It lies in a rich alluvial tract, surrounded on three sides by hills, behind which rise lofty picturesque mountains. On the river is Donegal castle, formerly belonging to the O'Donnells of Tyrconnell. On the shore are the ruins of a Franciscan monastery, founded in 1474 by Hugh O'Donnell. Pop. '91, less than 1500.

DONEGAL, a maritime co. of Ireland, in Ulster province, bounded on the n. and w. by the Atlantic. It has a very extensive and much indented coast-line, off which lie numerous islands. The surface is, for the most part, mountainous, moory, and boggy, with many small lakes and rivers. Some hills exceed 2000 feet in height. It has several rivers, of which the Foyle is the largest. Lough Derg is the largest lake. The minerals are not of importance and the inhabitants are mainly occupied with agriculture. Formerly, owing to the number of inaccessible retreats and the abundance of turf-fuel, it was the chief seat of illicit distillation in Ireland. In the county are some of the most congested districts in Ireland, and to relieve the pressure of population on subsistence, a royal commission on public works in 1887 advised the construction of railways. Since that time railway lines have been greatly extended in the county. Linen and woolen manufactures are carried on, and the female population is largely engaged in the working of muslin. Many of the inhabitants on the coast are occupied in the fisheries. The fine scenery in the northern part of the county draws many tourists, and the county contains interesting memorials of St. Columba, and the famous St. Patrick's purgatory, situated on an island in Lough Derg (q. v.). The population since 1841 shows a continual decrease, being at that date 296,448, and in 1891, 185,635. It returns four members to Parliament.

DONELSON, ANDREW JACKSON, 1800-71, American politician, nephew of Andrew Jackson, graduated at the U. S. Military Academy, and served for some time afterward in Florida, but resigned in 1822, studied law and was admitted to the bar in the following year. On Jackson's election to the presidency he was his private secretary, and in 1844 was appointed *chargé d'affaires* to the republic of Texas, with which he negotiated a treaty of annexation. He was afterwards minister to Prussia and to Germany, and in 1856 was a candidate of the American party for the presidency, but was defeated, after which he retired to private life.

DON'ELSON, FORT, on Cumberland river, Tenn., 12 m. e. of Fort Henry. It was an important point in the war between the states, and was strongly held by the confederates until Feb., 1862, when the Union forces under Grant laid siege to it. Buckner, the confederate commander, asked for terms, to which Grant replied: "No terms except unconditional surrender will be accepted. I propose to move immediately upon your works." Before night the fort and 8000 prisoners were surrendered.

DONETZ', a river in s. Russia, a tributary of the Don. It is 673 m. long, and is chiefly in the country of the Don Cossacks. It is navigable to Zmiev.

DONGAN, THOMAS, Earl of Limerick, 1634-1715; b. Castletown, co. Kildare, Ireland. He served in the English and French armies with the rank of col., was appointed lieutenant-gov. of Tangier, 1678, and gov. of the province of New York, 1682. Being a Roman Cath. he was at first looked upon with suspicion by the colonists, but he showed himself champion of their interests, managed the relations between the English, French, and Indians with great sagacity, granted a charter to the city of Albany, 1686, which still remains the basis of its municipal rights, and refused to carry out the instructions of King James II. to introduce French priests among the Five Nations, on the ground that the measure was dangerous to English power on the continent. He was obliged to resign, 1688; returned to England, 1691; and succeeded to the title of Earl of Limerick by the death of his bro., 1698.

DONG-NAI' or **DONAI**, is the name of a river in Lower Cochin-China. It flows into the sea in the n.e. of the delta of the Mekong.

DONGOLA, the name of a province in Eastern Africa, traversed in its central part by the valley of the Nile. The Mamelukes took possession of the country in 1820, but it was regained for Egypt by Ibrahim pasha, and remained under Egyptian control till the Mahdist revolt in 1886, when it passed under the power of the rebels. After the revolt Egypt reoccupied the northern part of Dongola, but the country was not fully restored to Egyptian rule till 1896, when an army under the Sirdar made an expedition into that region. The Dervishes offered slight resistance, the town of Dongola was captured by the Egyptians on September 23rd, and the whole province was reannexed. The province comprises the towns of New Dongola (Dongola Marakah) and Old Dongola. The former is situated on the Nile, and is the capital of the province, having been built about the year 1820 around the administrative buildings erected there by the Egyptian government. It has a considerable trade and a government factory. The population is estimated at 10,000. Old D. is a ruined town on the right bank of the Nile about 75 miles s.s.e. of New D.

DONIPHAN, a co. in n.e. Kansas, on the Nebraska border and the Missouri river; crossed by the old California overland route; 378 sq.m.; pop. '90, 13,535. The surface is chiefly prairie, and the soil good. Co. seat, Troy.

DO NIS CONDITIONALIBUS, STATUTE DE, called also the statute of Westminster the Second, 13 Edw. I. c. 1, is the statute which first established in England the power of creating an entail (q.v.).

DONIZETTI, GAËTANO, composer, b. in Bergamo, Italy, Nov. 29, 1797; d. there April 8, 1848. He studied at the Naples Conservatorio under Simon Mayr, and began to write operas, which gave him a local reputation. In 1830 he produced *Anna Bolena* in Milan, which brought him universal fame. His first operas were imitations of Rossini, but in his late works the dramatic element was more conspicuous, and he seems to have overshadowed Verdi. Donizetti wrote more than sixty operas, including: *Enrico di Borgogna*, Venice (1818); *Elizabetta a Kenilworth*, Naples (1828); *L'elisire d'amore*, ib. (1829); *Anna Bolena*, Milan (1830); *Parisina*, Florence (1833); *Torquato Tasso*, Rome (1833); *Lucrezia Borgia*, Milan (1834); *Maria Stuarda*, Naples (1834); *Lucia di Lammermoor*, his masterpiece, ib. (1835); *Marino Faliero*, Paris (1835); *Belisario*, Venice (1836); *La fille du regiment*, Paris (1840); *La Favorita*, ib. (1840); *Linda di Chamounix*, Vienna (1842); and *Don Pasquale*, Paris (1843). He also wrote church, chamber, and pianoforte music. See Filippo Cicconetti, *Vita di G. Donizetti* (Rome, 1860). Much of Donizetti's work is mediocre and therefore doomed to oblivion, owing to the haste and carelessness with which he wrote. He was known to strike off the score of an opera in two days, and the last act of *Favorita* is said to have been written in a single night.

DON'JON, or **DUNGEON**, the principal tower or keep (q.v.) of a castle (q.v.) or fortress. It was so called either from being placed on a *dun* or elevation, natural or artificial, or because, from its position, it dominated (Lat. *dominio*, corrupted into *domgio*, *dongeo*) or commanded the other parts of the fortress. From the circumstance that the lower or under-ground story of the donjon was used as a prison, has come the modern meaning of the word. See CASTLE.

DON JUAN is a legendary and mythical personage like Dr. Faustus. The two have been made the representatives of two different tendencies, both proceeding from the same principle—from the principle, namely, of unbelief and godlessness, which necessarily turns self into either a god or a beast—the principle of subjectivism, or selfishness become dominant. In Faust, expression has been given to the subjective idealism of the Germanic nations, their tendency to subtle speculation and a rationalism antagonistic to faith.

Although Faust and D. J. have thus the same source and the same termination, yet, as they proceed from opposite poles, they stand in contrast to each other, and, as was natural, have found different vehicles of expression—Faust in poetry, D. J. in music. The ideal of the D. J. legend is presented in the life of a profligate who gives himself up so entirely to the gratification of sense, especially to the most powerful of all the impulses, that of love, that he acknowledges no higher consideration, and proceeds to murder the man that stands between him and his wish, fancying that in so doing he had annihilated his very existence. Partly in wanton daring, partly to allay all uneasy misgiving, he then challenges that spirit in which he disbelieves to demonstrate to him its existence in the only way he holds valid—namely, through the senses. When this actually happens, when the spirit proves its existence and power by animating the marble statue which he had, with daring mockery, invited as his guest, and summoning him to the final tribunal, compels him to acknowledge the supremacy of spirit, and the worthlessness of a merely sensuous, godless, and immoral existence, it is all over with him, he is crushed, and sinks into hell.

This ideal career is aptly enough localized in one of the most luxurious cities of the once world-monarchy of the Saracens—viz., Seville—and the characters wear the names of the ancient noble families of the place. The hero of the story, D. J., is described as

a member of the celebrated family Tenorio, and is represented as living sometimes contemporary with Peter the Cruel, sometimes with Charles V. The chief aim of his sinful career is the seduction of the daughter of a governor of Seville, or of a nobleman of the family of the Ulloas. Being opposed by the father, he stabs him in a duel. He then forces his way into the family tomb of the murdered man, within the convent of San Francisco, causes a feast to be prepared there, and invites the statue which had been erected to his victim to be his guest. The stone guest appears at table as invited, compels D. J. to follow him, and, the measure of his sins being full, delivers him over to hell. At a later period, the legend came to be mixed up with the story of a similar profligate, Juan de Maraña, who had in like manner sold himself to the devil, but was at last converted, and died as a penitent monk in the odor of sanctity.

The genuine legend of D. J. was first put into form by Gabriel Tellez (Tirso de Molina), in *El Burlador de Sevilla y Convivado de Piedra*. This drama was transplanted to the Italian stage about 1620, and soon found its way to Paris, where numerous versions of it, among others Molière's *Festin de Pierre* (1669), made their appearance. It was brought on the English stage by Shadwell under the title of *The Libertine* (1676). In the end of the 17th c., a new Spanish version of Tellez's play was prepared by Antonio de Zamora, and brought on the stage. It is this version that forms the groundwork of the later Italian versions and of Mozart's opera. It was first put into an operatic form by Vincenzo Righini in *Il Convitato di Pietra* (1777); the text of Mozart's *Don Giovanni* was written by Lorenza da Ponte (1787). Through this famous opera the story became popular all over Europe, and has since furnished a theme for numbers of poets, playwrights, and writers of romance. A. Dumas has a drama, *Don Juan de Maranna*; Byron's *Don Juan* follows the name, and in so far the character of the original; and Prosper Mérimée's novel, *Les Ames du Purgatoire, ou les Deux Don Juan*, is founded upon it.

DONKEY, a quadruped of the genus *Asinus*. Its name is thought by some to be derived from its *dun* color with the suffix *key* referring to its diminutive size. As this animal is particularly noted for its obstinacy, the name is often applied to an obstinate or wrongheaded fellow. For a general description of the animal, see Ass.

DONKEY ENGINE, a small steam-engine, used in factories and especially on ship-board, as auxiliary to a large engine, drawing its steam from the main engine, and employed for pumping water into the boiler, raising and lowering goods and heavy weights, working the ship's rigging, raising anchors, working the fire apparatus, and like purposes.

DONLEY, a co. in n.w. Texas; formed 1876; and organized in 1882; crossed by Salt Fork of Red river; 908 sq. m. Pop. '90, 1056. Co. seat, Clarendon.

DONNE, JOHN, D.D., the son of an eminent merchant, cadet of an ancient family in Wales, was b. in London in 1573. His parents were Catholics, and he was educated in that faith. At the age of 11, he went to Oxford, where he remained three years; thereafter, he removed to Cambridge. Although he greatly distinguished himself at these seats of learning, the faith of his parents prevented him from taking a degree. At the age of 17, he entered Lincoln's Inn, to read for the bar; and while so engaged, he carefully studied the principal points in dispute between Catholics and Protestants, and finally joined the latter. About this time, he wrote several of his minor poems, the erotic heat of which contrasted strangely with the austerity of his later years. In 1594, he went abroad, and lived for three years in Spain and Italy. On his return, he was made secretary to Lord Ellesmere, then lord keeper of the great seal. Here he fell in love with that nobleman's niece, and they were privately married. When the union was discovered, D. was imprisoned by his enraged father-in-law. After his liberation, he recovered his wife by legal process, and, without settled employment, went to reside at the house of sir Francis Wooley, a kinsman of his wife. After the death of sir Francis, he removed to London, and lived with sir Robert Drury, in Drury lane. With sir Robert he went to Paris; and on his return, at the instigation of James I., who was delighted with the *Pseudo-Martyr*, a book which D. had written against the Catholics, he entered holy orders. He was made D.D. by the university of Cambridge; and after accompanying an embassy to the queen of Bohemia, he was made on his return dean of St. Paul's, and vicar of St. Dunstan's. A fever carried him off in 1631. His life has been written by Izaak Walton—forming one of the group of "lives" so praised by Wordsworth in a celebrated sonnet.

D.'s works consist of satires, elegies, religious poems, complimentary verses, and epigrams: they were collected and published by his son in 1650. An earlier but imperfect collection appeared in 1633. D. is usually considered as the first of a series of poets of the 17th c., who, under the infelicitous name of the metaphysical poets, fill a conspicuous place in English literary history. The directness of thought, the naturalness of description, the rich abundance of genuine poetical feeling and imagery, now began to give way to cold and forced conceits, and elaborate exercises of the intellect. Yet it is generally acknowledged that, amid much rubbish, there is not a little real poetry, and that of a high order, in Donne. His fancy was rich and subtle, his wit singularly keen and poignant, and his word-painting such, that, if he had possessed, in addition, music and sensibility, he would probably have enjoyed a perpetual popularity.

DONNELLY, IGNATIUS, an American author, born in Philadelphia, 1831, where he was educated in the public schools, and, having studied law, was admitted to the bar. Removing to Minnesota in 1857, he was elected lieutenant-governor of the state in 1859 and again in 1861. He served as a republican member from Dec. 7, 1863, to March 3, 1869. Besides his journalistic work as the editor of an anti-monopolist newspaper from 1873 to 1878, he is the author of an *Essay on the Sonnets of Shakespeare*; of *Atlantis, the Antediluvian World*, 1882, in which he tried to prove the existence in ancient times of a large island in the ocean opposite the straits of Gibraltar, known to early writers as Atlantis; and in 1883, of *Ragnarok*, the object of which was to demonstrate that the deposits of clay, gravel, and decomposed rocks, characteristic of the drift age, were the result of contact between the earth and a comet. His work, *The Great Cryptogram* (1887), from its application of Bacon's word-cipher (mentioned in *De Augmentis*) to the first folio of Shakespeare's plays, and its alleged proof of Bacon's authorship of the Shakespearean drama, attracted considerable attention. His other works include *Cesar's Column* (1891), *The Golden Bottle* (1892), *The American People's Money* (1895), etc.

DON NYBROOK, or **ST. MARY'S OF DONNYBROOK**, a village and parish in Dublin co., Ireland; now included in Pembroke, a western suburb of Dublin. The parish contains the villages of Donnybrook, Irishtown, Merrion, Ringsend, and Sandymount. The village of Donnybrook was long noted for its fair (begun under king John), kept up for half the month of August every year. In later times the fair lasted only a week. It was long notorious as a season of debauchery and fighting, and in 1855 was finally abolished.

DONT, JACOB, violinist, b. in Vienna, March 2, 1815; d. there, Nov. 8, 1888. He studied the violin in the Conservatorium in Vienna, where he was professor of this instrument from 1873 until his death. As a solo and quartet player, he was much esteemed. He also published works of value for the violin.

DON QUIXOTE. See CERVANTES.

DOO, GEORGE THOMAS, one of the best English historical engravers of the present day, was b. in the parish of Christ Church, Surrey, Jan. 6, 1800. He was undoubtedly best known by his famous plate of "Knox Preaching before the Lords of the Covenant," after Wilkie; while his admirable rendering of Eastlake's "Italian Pilgrims coming in sight of Rome," his exquisitely finished heads of women and children, after Lawrence, his engravings from Raffaele, Correggio, and others, have succeeded in winning for him a very high place in the estimation of the admirers of his laborious art. In 1851, he was elected a fellow of the royal society, and, in 1856, a royal academician. He was appointed chairman of the engravings committee of the London international exhibition of 1862. In 1864, he completed, after eight years' work, a large engraving of the "Raising of Lazarus," by Sebastian del Piombo. He d. 1886.

DOOLY, a co. in s.w. Georgia, on Flint river; 705 sq.m.; pop. '90, 18,146, incl. colored. The land is fertile, but much of it is occupied by pine forests. The chief productions are corn, cotton, and molasses. Co. seat, Vienna.

DOOM or **DUM PALM** (*Hyphæne Thebaica*), a species of palm remarkable for the repeated forkings of its stem. It is a native of upper Egypt and of the central parts of Africa. In some districts, it is the most plentiful tree, sometimes even forming forests, sometimes growing amidst the very sands of the desert. Its leaves are fan-shaped. Ropes are made of the fiber of its leaf-stalks. Its fruit is about the size of an orange, but of a somewhat elongated irregular shape; the outer skin is red, and this being peeled off, a considerable thickness of a spongy dry substance is found within it—also part of the *pericarp*—which has an insipid sweetness, and a remarkable resemblance to gingerbread, so that the tree is sometimes called the GINGERBREAD-TREE. This substance is used as an article of food, and an infusion of it as a beverage. The infusion is cooling, gently aperient, and very salutary in fevers. The albumen of the seed is hard and semi-transparent, and is turned into beads and other little ornaments. Each fruit contains one seed.

DOOMSDAY BOOK. See DOMESDAY BOOK.

DOOMSTER. See DEEMSTER.

DOON, a Scotch river, rising in the s.e. of Ayrshire in Loch Enoch. It runs n.w. through Loch Doon (5 m. by $\frac{1}{2}$ m., amid treeless mountains), past Dalmellington, Burns's monument, and Alloway kirk, to the firth of Clyde, 2 m. s. of Ayr. It is 30 m. long. On leaving Loch Doon, the river flows through Glen Ness, a huge rocky and wooded ravine, not surpassed in picturesque beauty by any similar scenery in Scotland. On an islet in the loch are the ruins of Doon castle, where Edward, brother of Robert Bruce, is said to have lived. Burns has immortalized the D. in song.

DOOR and **DOORWAY**, in art. The form of the doorway is determined by the architectural style of the building in which it is placed. In classical buildings, it is generally rectangular in form, though both Greeks and Romans, following the Egyptians, amongst whom the practice was almost universal, occasionally diminished the opening towards the top; and the Romans, in later times, very frequently threw over it the circular arch, which was the characteristic feature of their style. Egyptian doorways are known to us, for the most part, only by the examples which remain in monumental structures; and these, like the other members of the style as thus exhibited, are of gigantic proportions. The doorway of the temple at Edfu measures 74 ft. to its summit, but the lintel and cornice which cover it are so deep and massy as to occupy a space of no less than

23 ft., so that the height of the aperture is only 51. With the Egyptians, the doorway was an architectural object of very great importance. On either side of it, colossal statues or obelisks were placed, and the approach to it was often lined with rows of gigantic sphinxes.

The Greek doorway was surrounded by moldings, and as the lintel or top-stone which covered it projected on both sides beyond the jambs, the moldings which ran round both jutted out at the place of meeting, forming a sort of shoulders, as in a doorway of Erechtheum. This arrangement, however, was by no means uniform, the moldings of the jambs being frequently quite separated from those of the architrave. The doors themselves, in antiquity, in private dwellings, were generally of wood; and in structures devoted to religious or public purposes, of metal, and occasionally of marble. They were generally paneled, and turned on pivots working in sockets. With the exception of the forms of the windows, and the tracery and foliage of the pillars, doorways are the most characteristic feature in all the styles of Gothic architecture. In the earliest, which we in this country are in the habit of calling Saxon, and which on the continent is commonly known as Romanic, they are of course very plain. There is seldom more than a few simple moldings, surrounding a semicircular arch, and in some of the earliest examples, the head of the opening is covered by two flat stones, leaning upon each other in the center, and their other ends being placed on the imposts, so as to form a triangle. In the Norman style, they become gradually more ornamental. The arch still continued in general to be semicircular, though there are a few instances of the segmental or horse-shoe arch. As the style advanced, the moldings and enrichments became more various. Of these, that which is most characteristic of the style is the zigzag molding. Circular or octagonal shafts were now frequently placed in the jambs, and these, too, were often ornamented with zigzag or spiral moldings, their capitals being enriched with foliage or grotesque heads or figures. The opening of the doorway often does not rise higher than the springing of the arch, and in this case it is generally flat, the semicircular space between it and the arch being frequently ornamented with a sculptured representation of some scriptural subject. The few Norman doors that exist are devoid of ornament, with the exception of projecting nails, and a simple iron scroll-work projecting from the hinge, and stretching to a greater or less extent over the door. As the doorway adheres strictly to the characteristics of the style, early English doorways of course generally terminate in pointed arches. In these the moldings are more numerous, the jambs contain a greater number of small shafts, some of which occasionally stand quite free, and on the whole the work is richer in form, and more finished in execution. The opening of the doorway is now frequently divided into two, either by a single shaft or a clustered column. In the decorated style, the doorways are not in general so deeply recessed as in the early English; and this circumstance takes from them in richness more than they gain in elegance by their greater height, and by the more delicate character of their ornamentation. In these, the moldings are commonly enriched with flowers or foliage, either in running patterns or placed separately at short intervals. Of these, the commonest are the ball-flower (q.v.), and a flower of four leaves, which often projects boldly, and produces a fine effect. The iron scroll-work on the doors resembles that in the former style, except that the terminations are more frequently worked into leaves or flowers. In other cases, the doors are paneled, and covered with characteristic tracery. In the perpendicular style, though the door continues to be arched, it is usually placed under a heavy square external molding. The doorway in this style loses much of the depth and richness which belongs to it in the earlier styles which we have been considering. Shafts are still used in the jambs, though not always, and they are generally small and few in number; the capitals of the jambs rarely possess the same richness of foliage, and frequently consist merely of plain moldings. One or more large hollows are often left in the jambs, forming small niches, which frequently contain statues. This latter characteristic seems to be peculiar to the perpendicular style. In the doorways, as well as in the windows of this style, the four-centered arch came into general use, but two-centered arches, and, in small doorways, ogrees, are frequently to be met with. The doors in the perpendicular style, when ornamented, are usually paneled, the upper parts being sometimes covered with tracery, but the fine iron scroll-work of the earlier styles had entirely disappeared.

DOOR, the movable panel by which the opening to an apartment, closet, or passage is closed. Doors are made of wood, iron, bronze, or stone. When moving horizontally on hinges, they are called *swing-doors*; when two such are used to close one opening, they are *folding-doors*. *Sliding-doors* are those which move on rollers, and may be pushed aside. A *jib-door* is one which is concealed as much as possible when shut. A *trap-door* is one which opens vertically over a horizontal opening, as a hole in a floor, etc. When a small door closes an opening cut in a larger one, it is usually called a *wicket*.

Doors are commonly made of wood, and these we shall first describe. The most simply made door is constructed of several boards joined together at their edges by a *rebate*, or a *plowed and tongued groove* (see CARPENTRY); these are held together by a transverse piece simply nailed to each board; this is called a *ledge*, and the door thus made, a *ledge-door*. These are commonly used for workshops, stabling, etc.;

but when durability and appearance are to be combined, a stout frame is first made, its parts joined together by mortise and tenon. See CARPENTRY. This frame has one or more openings—usually four—which are filled with thin pieces called *panels*, fitted into grooves plowed in the edges of the frame. The horizontal pieces of the frame are, according to their position, called the top-rail, bottom-rail, lock-rail, and frieze-rail. The lock-rail is that to which the lock is fixed, the frieze-rail intermediate between the middle and top-rail in large doors. The extreme vertical parts of the frame to which the rails are fixed are called *stiles*, and the intermediate vertical part, a *mounting*. Doors are named one, two, four, six, etc., paneled doors, and are further described by the kind of molding which surrounds the panel, and from the description of panel. The main object of framing, besides appearance, is to counteract the tendency of the wood to warp, by binding the different parts together with pieces having their fibers at right angles to each other.

In many old buildings, the outer, and even some inner doors are made of massive oaken planks, bound together with ornamental iron straps. Iron doors are chiefly used to intercept fire. For this purpose, they are best made of wrought iron, with double sides. Bronze doors are sometimes used for churches and other large buildings. They are usually ornamented with castings in high and low relief. Those of the baptistery of the cathedral of Florence, by Ghiberti, and the pantheon of Rome, are among the most celebrated examples. A few examples of marble doors exist, chiefly in cemeteries and some Belgian churches.

DOOR, a co. in n.e. Wisconsin, between Green bay and lake Michigan; 450 sq.m.; pop. '90, 15,682. Agriculture is the chief business. Co. seat, Sturgeon Bay.

DOORRA. See DURRA.

DOOR-KEEPER, in the senate and house of representatives of the federal congress, and in the corresponding bodies in state legislatures, an officer chosen by vote of the body who has general charge of the rooms. He announces messages from presidents, governors, or the co-ordinate legislative bodies; attends to the dispatch of documents, and assists the sergeant-at-arms in keeping order.

DOORN, in English, *thorn*, is a common name in s. Africa. It indicates various communes in the Cape Colony. It also designates two rivers, distinguished as *Great* and *Little*, both of them joining the Olifant, or Elephant, on the right, but the smaller from the s.e., and the larger from the north-east.

DOORN BOOM, *Acacia horrida*, the most common tree in the wastes of s. Africa. The name D. (*thorn-tree*), given to it by the Dutch colonists, and the botanical specific name, are due to the number and sharpness of its spines. It seldom much exceeds 30 ft. in height, but its timber is hard and tough, and is much used for house-carpentry, etc. See ACACIA.

DOOS'TEE, a river of Beloochistan, running s. through the entire country, and falling into the Arabian sea. It is about 900 m. long.

DOQUET, or **DOCKET** (from the same root as *dock*, to cut off or clip), a small piece of paper or parchment, containing a brief or summary of a large writing. All attestations or declarations annexed to written instruments are called doquets, more particularly those that are done by a notary. The notarial D. is said to be the most ancient example of fixed style in Europe; and though latterly appropriated to the instrument of sasine, it was formerly common to all solemn instruments. It consisted of a Latin attestation, holograph of the notary, annexed to the notarial instrument prepared by him. The name of the notary was set forth, and the authority mentioned, by which he had been appointed to be a notary. In the case of an instrument of sasine, it stated that he was personally present with the witnesses; that he saw, knew, heard, and noted the circumstances mentioned in the sasine; that he prepared the instrument, and the number of pages it contained. In addition to his subscription, the notary was formerly in use in Scotland to add his *signum*, which was a flourish of the pen, called a paraph or ruck. Latterly, he only subscribed the document on each page; and on the last page, opposite to the D., he added to his subscription the motto which he had assumed on his admission as a notary. The notarial D. of instruments of sasine was superseded by 8 and 9 Vict. c. 35, s. 5. See DOCKET.

DOR. See DUNG BEETLE.

DOR, or **MONT DOR** (often written less properly *Mont d'Or*), a chain of mountains in France comprised in the great group of the Auvergne (q.v.) mountains in the department of Puy-de-Dome. They are clearly of volcanic formation, and rise in the Puy-de-Sancy, which is the highest peak of central France, to the height of 6,190 feet.

DORA D'ISTRIA. See GHICA (HELENA).

DORAK, a t. of Persia, in the province of Khuzistan, situated on a marshy plain at the junction of the D. with the Jerrahi. It is surrounded by a mud-wall, and defended by a fort. By a canal which unites the D. with the river Karun, a considerable trade is carried on. Population estimated at from 6000 to 12,000.

DORAN, JOHN, PH.D., a copious contributor to miscellaneous literature, descended from an old Irish family of Drogheda, was b. in London in 1807. In early life he resided in France and Germany, and was chiefly educated by his father. So early as 1822, he produced the melodrama of *The Wandering Jew*, and at the age of 20 became the editor of the *Literary Chronicle*. In 1835, he wrote a history of Reading, but from that time till 1854, he confined his labors to the periodical press. In the latter year he published *Habits and Men*, followed by *Table Traits and Something on them*. *Lives of the Queens of England of the House of Hanover* appeared in 1855; *Knights and their Days*, in 1856; *Monarchs retired from Business*, in 1857; *History of Court Fools*, in 1858; *New Pictures and Old Panels*, in 1859; *The Princes of Wales*, in 1860; and a *Memoir of Queen Adelaide*, in 1861. In 1864, he produced *Their Majesties' Servants*, a history of the stage from Betterton to Kean; in 1868, *Saints and Sinners*; and in 1873, his most interesting work, an account of Mrs. Montague and the "blue stockings" of her day, under the title of *A Lady of Last Century*. In 1876, he published *Mann and Manners*, the letters of sir Horace Mann to Horace Walpole. His last work, *London in Jacobite Times*, appeared in 1877. Besides being a large contributor to miscellaneous literature, Dr. D. several times edited the *Athenæum*, and at his death, 25th Jan., 1878, he was editor of *Notes and Queries*.

DORCAS SOCIETY, the name given to an association of ladies who supply clothes to necessitous families. The name is taken from Acts ix. 39: "And all the widows stood by him weeping, and shewing the coats and garments which Dorcas made, while she was with them."

DORCHESTER, a co. in s.e. Maryland, on Chesapeake bay, intersected by the Philadelphia, Wilmington and Baltimore railroad; 610 sq. m.; pop. '90, 24,843, inclu. colored. Productions, wheat, corn, etc. Co. seat, Cambridge.

DORCHESTER, a co. in Quebec, Canada, bordering on Maine, and drained in part by Chaudière river. Pop. '91, 19,042. Co. seat, St. Henedine.

DORCHESTER, DANIEL, D.D., b. Massachusetts, 1827; educated at Wesleyan univ., Conn.; Meth. Epis. clergyman since 1847, and a presiding elder for three terms of four years each; member of Conn. state senate, 1854, and chairman of commissioners on idiocy, 1854-55; member of Mass. house of representatives, 1882; historiographer of N. E. Methodist Historical soc. 1881-85; pres. of national league (non-sectarian) for suppression of liquor traffic, 1885. Among his published works are: *Concessions of Liberalists to Orthodoxy* (1878); *Problems of Religious Progress* (1881); *Giving and Worship* (1882); *The Liquor Problem in All Ages* (1884). He has high standing as a religious statistician.

DORCHESTER, a municipal, and till 1885 a parliamentary borough, the co. town of Dorsetshire. It has a considerable trade in ale and beer, and sends much butter to London. Pop. '91, 7946. D. was the Roman *Durnovaria* or *Durinum*, a walled town with a fosse, and a chief Roman British station. Parts of the wall, 6 ft. thick, remained till 1802. Near D. are the remains of the most perfect Roman amphitheater in England, 218 by 163 ft., and 30 ft. deep, the seats rising from the arena, cut in the chalk, and capable of holding 13,000 spectators. There is also a Roman camp with a ditch and high vallum. Near D. is a large British station with three earthen ramparts, a mile and a half in circuit, and pierced by intricate passages, and inclosing barrows. The inner rampart is 60 ft. high. Here, in 1685, judge Jeffreys, in his "bloody assize," sentenced to death, in two days, 109 persons implicated in Monmouth's rebellion.

DORCHESTER, was formerly a town in Norfolk co., Mass., but since 1870 a ward of the city of Boston; pop. '90, 18,048. The locality was settled by Puritans from Dorchester, Eng., under the lead of the Rev. John White, who landed at Nantasket, June 11, 1630. The codfishery, so important to New England, originated in Dorchester, and there was erected the first mill in America driven by water-power. Large portions of this district are exceedingly attractive, with beautiful suburban residences.

DORDOGNE, a river rising in s. central France, running w. through the departments of Corrèze, Lot, and Dordogne, and falling into the Garonne, 13 m. n. of Bordeaux; about 260 m. long, and navigable for 150 miles.

DORDOGNE, a department in the s.w. of France, formed of the ancient province of Périgord, with small portions of Limousin, Angoumois, and Saintonge. Area, 3,546 sq. m. Pop. '96, 464,822. The surface is for the most part hilly, and covered with broom and underwood, with here and there a valley of extraordinary beauty and fertility, inclosed with hills, the sides of which are generally clothed with vineyards. There is a great deficiency of corn, but the want, as an article of food for the inhabitants, is supplied to some extent by the immense produce of the chestnuts.

DORDRECHT. See DORT.

DORÉ, PAUL GUSTAVE, a French artist of great and versatile power, was b. at Strasbourg in 1832. He was educated at Paris, and very early gave indication of superior ability. His first attempts were sketches, contributed to the *Journal pour Rire* and others of the Paris periodicals. In 1855, he exhibited his picture of the "Battle of the

Alma," which was followed by the "Battle of Inkerman" in 1857. In this year he first became heard of in England by the reissue of his illustrations of the legend of the "Wandering Jew," the power of weird and grotesque imagination displayed in which could not fail to arrest attention. The success of this work might seem to have determined the future career of the artist, who afterward chiefly worked as an illustrator. His productiveness in this field is amazing. Doré illustrated editions of *Rabelais*, of the *Contes Drolatiques* of De Balzac, of Dante's *Divina Commedia*, of *Don Quixote*, of Lafontaine's *Fables*, of Milton, and of the Bible—all of which bear the impress of his original genius. Besides these, he illustrated Tennyson's works, Coleridge's *Ancient Mariner*, the *Atala* of F. Chateaubriand, and a tour in Valencia, besides executing a vast mass of miscellaneous work. Doré from time to time reproduced and exhibited in Paris and London many of his designs. The "Doré Gallery," used for this purpose, was a resort in London for several years. "Christ leaving the Prætorium" is his most important painting. The slightest of D.'s productions shows that he is at once artist and poet, and excites a greater interest than many works more free from hastiness and mannerism. In 1861, D. received the decoration of the legion of honor. He had some reputation as a sculptor. He d. 1883.

DORIA, ANDREA, a noble Genoese, and one of the greatest admirals of his age, was b. at Oneglia in 1468. At an early age, he took service in the guard of the pope, Innocent VIII., and afterwards distinguished himself in the battles which the Milanese and the French fought against Genoa and the kings of Aragon. It was D. who, in 1503, after a short campaign, crushed the rebellion in Corsica. When Genoa, in 1513, got rid of the French domination, D. was appointed capt.gen. of the galleys, in which capacity he carried on a war of extermination against the dangerous swarms of African pirates who infested the Mediterranean. During the war between Francis I., king of France, and Charles V., emperor of Germany, and king of Spain, D. commanded the French fleet, reinforced by his own galleys, and inflicted everywhere severe losses upon the enemy. After the defeat of Francis I. near Pavia, D. accepted the command of the papal fleet; but upon the return of the king from his captivity, entered once more the French service, with the title of high-admiral of the Levant. He blockaded Genoa, for having espoused the cause of the emperor, and putting to flight the party of the Adorni, took the town. On finding the independence of his country threatened by the French, D. with his whole force went over to the emperor, and by so doing hastened the deliverance of Italy from French domination. In 1529, D. entered Genoa without resistance, and refusing the title of sovereign, which was offered by the emperor, established there a popular form of government, which remained in vigor up to the end of the republic. The grateful country decreed him the title of "Father of Peace;" and the emperor, in whose service D. continued, conferred upon him the order of the golden fleece, together with the principality of Melfi. In 1532, D. won a decisive victory over the Turks near Patras, and the conquest of Tunis (1535) was chiefly his work. He took part in the joint expedition against the Turks under Barbarossa in 1539, and in another against Algiers in 1541, where he lost 11 of his own galleys. The tranquillity of his last years was disturbed by the conspiracy of Fieschi. D. took fierce revenge upon the conspirators for the death of his nephew Gianettino. D. died without offspring, in 1560, at Genoa, in his 93d year.

DORIANS, one of the four principal peoples of Greece, who took their name, according to the legend, from Dorus, the son of Hellen, who settled in Doris; but Herodotus says that in the time of king Deucalion they inhabited the district Phthiotis; and in the time of Dorus, the son of Hellen, the country called Histiaëotis, at the foot of Ossa and Olympus. But the statement of Apollodorus is more probable, according to which they would appear to have occupied the whole country along the northern shore of the Corinthian gulf. Indeed, Doris proper was far too small and insignificant a district to furnish a sufficient number of men for a victorious invasion of the Peloponnesus. In this remarkable achievement they were conjoined with the Heracleidæ, and ruled in Sparta. Doric colonies were then founded in Italy, Sicily, and Asia Minor. Strikingly as all the four nations of Greece differed from each other in language, manners, and form of government, the D. in particular differed from the Ionians. The former preserved a certain primitive solidity and earnestness, but with it something coarse and hard. See O. Müller's *Die Doriër* (2 vols., Breslau, 1824; 2d ed. 3 vols, 1844). The *Doric dialect* bore the same character; it was harsh and rough, while the Ionian was soft and polished, yet the former had something venerable from its antiquity, and was therefore employed in hymns and choruses. In philosophy, the influence of the Doric character was particularly visible in the Pythagorean school and its attachment to the aristocracy. It is no less traceable in architecture in the strong unadorned Doric pillars, which form so marked a contrast to the slender and decorated Ionian columns.

DORIC ORDER. The oldest, strongest, and simplest of the three orders of Greek architecture. See COLUMN; ENTABLATURE; GRECIAN ARCHITECTURE.

DORIS, a genus of gasteropodous mollusks of the order *nudibranchiata*, the type of a family called *dorida*, and sometimes popularly SEA-LEMONS. The body is oval, the abdomen flat, the back flat in some and elevated in others, the mouth a small proboscis with two small tentacula, the vent situated in the back, and surrounded by a

circle of branched or plumed gills. The species are found in all seas, many in those of Britain; but they are more numerous in the southern hemisphere. Some of them attain a considerable size. Few of them inhabit deep water. They crawl on rocks, sea-weeds, etc., where they are often left by the tide, or swim in a reversed position; the foot, made concave by muscular action, serving to buoy them up. Some of them are pretty and interesting inmates of the aquarium. Gosse mentions, that specimens of *D. bilamellata* were "very social in confinement, continually finding out one another, and crawling close up together."—*A Naturalist's Rambles on the Devonshire Coast*.

DORIS, a small mountainous district of ancient Hellas, between Phocis, Ætolia, Locris, and Thessalia, was the earliest home of the Dorians. With its four towns, Boium, Cytinium, Erineus, and Pindus, it formed the Doric Tetrapolis, which was afterwards completely destroyed by the Macedonians, Ætolians, and other nations, so that at the time of the Romans, only a few remains of these towns were visible.—D. was also the name of a district in Asia Minor, on the coasts of Caria, inhabited by colonists from the Peloponnesus; it formed a *hexapolis*.—In modern Greece, D. forms an eparchy of the government of Phocis.

DORKING, or **DARKING**, a t. in England, in the middle of Surrey, stands in a picturesque valley on the left bank of the Mole, 23 m. s.w. of London by road. It lies on the Roman road which ran between London and Chichester. Pop. '91, 7132. Its chief trade is in flour, lime, and chalk from the adjacent pits. D. gives its name to a peculiar breed of domestic fowl.

DORMANT (Fr. sleeping). In heraldic representation, an animal dormant has its head resting on its forepaws, whereas an animal couchant has its head erect.

DORMANT VITALITY is a term used to designate a peculiar condition which is manifested by many organized beings, and which is characterized by an apparent suspension of all the vital actions. Beings in this state can scarcely be said to be *alive*, since they exhibit no vital activity, nor can they be designated as *dead*, since that implies their incapability of resuming their former state; hence, since they retain their peculiar attributes without manifesting them, the term D. V. seems the most appropriate for them. This condition may result either from the withdrawal of the stimuli necessary for the maintenance of vital actions (as water, heat, etc.), or it may proceed from some change in the organism itself, whereby its power of responding to these stimuli is for a time diminished or lost. We shall illustrate our meaning by a few striking examples of each kind of dormant vitality.

1. D. V. from the withdrawal of the necessary stimuli.

Seeds deprived of access to air and moisture may retain their vitality for an enormous time. "I have now before me," says Dr. Lindley, "three plants of raspberries which have been raised in the gardens of the horticultural society, from seeds taken from the stomach of a man whose skeleton was found 30 ft. below the surface of the earth, at the bottom of a barrow that was opened near Dorchester. He had been buried with some coins of the emperor Hadrian, and it is probable, therefore, that the seeds were 1600 or 1700 years old." A more remarkable illustration of the vitality of seeds is afforded by a case communicated to Dr. Carpenter, and published in his *General and Comparative Physiology* the facts of which may be shortly stated as follows: In a town in the state of Maine, about 40 m. from the sea, a well was being dug, and at a depth of about 20 ft. a stratum of sand was found, which excited interest, from the circumstance that no similar sand was known to exist nearer than the sea-beach. It was, in the first instance, collected in a heap, but was subsequently scattered about the spot on which the heap had stood. In a year or two, when the very existence of the sand was almost forgotten, it was observed that a large number of small trees were growing up on the ground where it had been strewed. They turned out to be beach plum-trees, and they actually bore the beach-plum, which had never before been seen except immediately upon the sea-shore. These trees had therefore sprung up from seeds which were in the stratum of sea-sand that had been pierced by the well-diggers, and had probably retained their vitality through a period of time beyond the estimation of human calculation—the period, namely, in which the sea had gradually receded 40 m. from its present limits.

Among the lower animals, we find several of comparatively complex structure, in which D. V. can be induced for a considerable period, as, for instance, several years by the abstraction of their *moisture*. The well-known rotifer, the wheel-animalcule, may be reduced to a state of perfect dryness, and kept in this condition for a great length of time (certainly three or four years, and some writers say far longer) without evincing a sign of life, and yet it will immediately revive on being moistened. The *tardigrades*, an allied tribe, have been desiccated by the most powerful means which chemistry affords, and have been then heated to a temperature of 250°, and have still been revived by water, although in their active state a temperature of 120° destroys them. In Woodward's *Manual of the Mollusca*, cases are recorded of living snails crawling out of shells which were supposed to be empty, and in which they must have been dormant for several years, and the eggs of snails and others of the lower animals have a still greater power of revivification after drying. Sir James Emerson Tennent describes various fishes in Ceylon which bury themselves in the mud when the pools or tanks dry up, and remain torpid until the periodic rains of that country ensue, and previous observers

had noted similar facts in other tropical countries. Humboldt relates that crocodiles and boas are sometimes found alive, though torpid, in hardened mud, and revive on the application of water.

A *diminution of temperature* will induce this phenomenon in many animals. In one of capt. sir James Ross's voyages, several caterpillars having been exposed to a temperature of 40° below zero, froze so completely that, when thrown in a tumbler, they chinked like lumps of ice. When thawed, they resumed their movements, took food, and became transformed into the chrysalis state. One of them, which had been frozen and thawed four times, subsequently became a moth. In the North American lakes, frozen fishes are often found in the ice, which revive when gently thawed. Spallanzani kept frogs and snakes in a torpid state for three years in an ice-house, and then revived them by warmth. The same capability does not exist, at all events to the same extent, in the warm-blooded animals. A *total suspension of vital activity* in a bird or a mammal for any length of time, from the prolonged application of severe cold, or from any other cause, is never followed by recovery. The stories of certain birds burying themselves in the mud during winter, are regarded by the best authorities as more than questionable; and in hibernating mammals (see HIBERNATION), the suspension is not total. How we are to explain, or whether we ought to believe, the remarkable cases of certain Indian fakirs, who are stated to have the power of suspending all their vital activity for days, or even weeks, we do not know. The late Mr. Braid, of Manchester, published a collection of these cases, directly obtained from British officers who had been eyewitnesses of them in India, in his *Observations on Trance or Human Hibernation*, 1850. We quote one of these, vouched for by sir Claude Wade. The fakir was buried in an underground cell, under strict guardianship, for *six weeks*; the body had been twice dug up by Runjeet Singh (at whose court the exhibition came off) during the period of interment, and had been found in the same position as when first buried. In this and in all the other recorded cases, the appearance of the body when first disinterred is described as quite corpse-like, and no pulsation could be detected at the heart or in the arteries. The means of restoration employed were chiefly warmth to the vertex, and friction to the body and limbs.

2. Dormant vitality from changes within the organism.

The insect world affords us the chief illustrations of this variety of dormant vitality. The pupa or chrysalis stage of insect life is in itself one of dormant vitality, unconnected with any of the external influences which we have been describing. That this stage may be much shortened by artificial heat, and prolonged by artificial cold, has been known since the time of Reaumur; but, as the following case shows, there are other causes inherent in the animal itself, which tend at a certain time to prolong the pupa condition. In the *papilio machaon* there are two generations every year; for the butterfly that comes forth in the early summer lays eggs which rapidly pass through all the phases of insect life, and produce another set of eggs later in the season, whose *larvæ* or caterpillars turn into *pupæ* before the winter. The pupa stage of the first brood (in July) lasts only 13 days, while that of the second brood (which commences in Sept.) lasts 9 or 10 months, the butterfly not appearing until the following June. The difference of temperature is obviously quite insufficient to account for the great diversity between the two periods. Several other similar cases may be found in Kirby and Spence's *Entomology*.

DORMER, or **DORMER WINDOW**, is a window placed in a small gable rising out of a sloping roof, often made use of for the purpose of enlarging and lighting the attic or garret-rooms of modern houses. It is also popularly known as a storm-window. *Dormers* do not appear to have been invented before the middle of the 14th century.

DORMITORY (Fr. *dormitoire*, from Lat. *dormire*, to sleep), a sleeping apartment in a monastery, or other religious establishment. Dormitories are usually of considerable size, sometimes having a range of cells parted off on each side.

DORMOUSE, *Myoxis*, a genus of rodent quadrupeds, ranked by some naturalists in the family *muride* (rats, mice, etc.), and by others in the family *sciuride* (squirrels, etc.); being, in fact, a connecting link between the one family and the other. Their habits resemble those of squirrels; the dentition, however, more nearly agrees with that of mice. There are four molar teeth on each side in each jaw: the upper jaw has not the anterior rudimentary fifth molar, characteristic of squirrels. The molars have their summits marked by transverse ridges. There are no cheek-pouches. The ears resemble those of mice. The fore-paws have each 4 toes and a rudimentary thumb; the hind-feet have 5 toes. The fur is very fine and soft. The tail is long, and in the different species exhibits characters variously intermediate between those of mice and squirrels. This genus and the closely allied genus *graphyurus* are remarkable as the only genera of rodents in which there is no cæcum. The species of *D.* are beautiful little animals, natives chiefly of the s. of Europe. Some species are also found in Africa, and the genus *graphyurus* is entirely African. The only British species of *D.* is the **COMMON D.**, **RED D.**, or **MUSCARDINE** (*M. acellanarius*), an inhabitant of woods in some parts of England. It is about the size of a common mouse, with head proportionally large; has a rather pointed muzzle, large prominent eyes, and a flattened tail, thickly clothed with rather long hair; and is of a tawny red color on the upper parts, and white beneath.

It is extremely gentle and easily tamed, feeds on beechmast, acorns, hazel-nuts, grain, etc., and spends the colder parts of winter in a state of torpidity, although in mild weather it wakens up to consume a little of the store of food which, like squirrels, it lays up for that season. Before its hibernation begins, it is generally very fat, nor does it become emaciated by hibernating. It makes a nest of tangled or interlaced herbage opening from above, usually in copse or underwood; and produces about 4 young ones at a birth. It often assumes a remarkable posture in feeding, suspending itself by its hind-feet; more generally it sits upon its haunches, and holds its food in its fore-paws. This species is found in all parts of continental Europe, from the Mediterranean to Sweden.—The FAT D. (*M. glis*) is a larger species, grayish brown, about the size of a rat, with tail very like that of a squirrel, a native of the s. of Europe, where it inhabits forests, leaping from branch to branch with great agility. It is eaten by the Italians, as it was by the ancient Romans, who highly esteemed it, and fattened it for the table in receptacles called *gliraria*.—The GARDEN D. (*M. nitela*), common in Europe as far n. as Poland, is frequently found in gardens, and even in outhouses. It is often very destructive of the fruit of wall and espalier trees. It is rather smaller than the fat D., grayish brown, black round the eyes, and has the tail tufted only at the extremity. All the species of *D.* hibernate; and from this circumstance the name seems to be derived (Lat. *dormio*, to sleep).

DORNBIERN, a t. of Austria, in the n.w. of Tyrol, about 8 m. s. of the eastern extremity of the lake of Constance, is situated on the Lossen, a small mountain stream. The houses are widely scattered. The women of *D.* are chiefly employed in muslin-embroidery; the men are for the most part carpenters, and are principally engaged in the construction of wooden houses, which are carried in detached pieces to the market-town (Bregenz), and are thence exported. Pop. '90, 10,678.

DORNER, ISAAC AUGUST, D.D., b. Württemberg, 1809; son of a Lutheran minister; studied at Tübingen, and a professor there in 1838. Soon afterwards he was professor of divinity and counselor of the consistory at Königsberg. From 1847 to 1853, he held a chair at Bonn, then removed to Göttingen; and in 1862, was appointed professor of systematic theology and exegesis in the university of Berlin. His best known work is the *History of the Development of the Doctrine of the Personality of Christ*. Others, translations of which have been published, are: *Christliche Glaubenslehre*, 2 vols., 1880; *Gesammelte Schriften aus dem Gebiet der Systematischen Theologie*; and *Exegese und Geschichte*. He d. at Wiesbaden, 1884. Uniting great learning and deep thinking, he was a strong upholder of evangelical Christianity as opposed to German rationalism. On a few points, mostly eschatology, his views have been criticized as divergent from the prevalent theology.

DORNICK, **DORNIC**, **DORNOCK**, a species of figured linen, for a full description of which see Ure's *Dict. of Arts and Manufactures*. Dornicks were formerly made in considerable quantity at Dornich, or Tournay, in the Netherlands, and hence their name. From this place, the manufacture was probably carried to Norfolk by the Dutch, who emigrated thither during the persecution of the duke of Alva. By a statute, 5 and 6 Ed. VI. c. 24, this manufacture, or "mystery," carried on at Norwich, is carefully protected. All persons except those residing in Norwich or Pulham, are forbidden to carry on the "mystery," under pain of forfeiture of the article, and of the sum of 6s. 8d. for every six yards so made. By 4 Will. and Mary, c. 5, s. 2 (68), a duty of 10 per cent, in addition to duties previously levied, is laid on all tapestry or dornicks imported, except from France. It is scarcely necessary to add, that these stringent provisions are no longer in observance.

DORNOCH, a royal burgh and co. t. of Sutherlandshire, situated near the entrance to the DORNOCH FIRTH—an inlet of the North sea, running 25 m. inland, and separating Sutherland from Ross-shire. The cathedral stands in the center of the town, and is an object of considerable attraction. It is said to have been begun in the 11th c. by St. Bar, and was enlarged in 1270 by bishop Gilbert Murray. It was burned in 1570, and thereafter partially repaired. In the year 1837, it was to a certain extent restored by the late duchess of Sutherland. It is in the shape of a cross, and is surmounted with a tower and clock spire. The interior is fitted up and used as the parish church. *D.* was, in olden times, the residence of the bishops of Sutherland and Caithness. The west tower of the bishop's palace stands immediately opposite to the cathedral.

DOROG, or **HAJDU-DOROG**, a t. of Hungary, 20 m. n.n.w. from Debreczin, situated in the midst of a very fertile district. The pop., about 8,700 in number, are chiefly engaged in agricultural pursuits.

DOROGOBUSSH, or **DOROGOBOUGE**, a t. of Russia, in the government of Smolensk, is situated on the left bank of the Dnieper, about 50 m. e.n.e. of Smolensk. It is a small town, but pretty, and well built, and has some manufactures. Pop. about 8500. At *D.*, the French under Eugène, in their retreat from Moscow, encountered many disasters.

DORP, a former town in Prussia, in the government of Düsseldorf, 17 m. n.e. of Cologne; population, 1885, 13,285. In January, 1889, it was united with Solingen.

DORPAT, or **DERPT** (Russian, *Yuriev*, its official name; Esthonian, *Tartolin*), a t. of Russia, in the government of Livonia, is situated on the Embach, here crossed by a fine granite bridge, 150 m. n.e. of Riga, and is built in the form of a semicircle. It consists of a town proper, with two suburbs. Its streets are straight and clean; its houses, which are mostly of one story, are built of brick or wood, have handsome fronts, and are often showily painted. It is the winter residence of the Livonian nobles and gentry. The Domberg hill, at the n.w. extremity of the town, is tastefully laid out in avenues and promenades; its summit, formerly the site of a cathedral, destroyed by fire in 1775, is now occupied by an observatory, the university library, schools of anatomy and natural history, museums, etc. The observatory—one of the most renowned in Europe, and long presided over by the celebrated Struve—possesses a great refracting telescope, presented by the emperor Alexander I. The university, founded in 1632 by Gustavus Adolphus, suppressed in 1656 by the Muscovites, and re-established by Alexander I. in 1802, is also famous. It supports a large staff of 70 professors and lecturers, and is well attended. It had the privilege of self-government till 1889, when it was deprived of it by the Russian government. It was also required to use the Russian language in instruction. It is also the chief school of the Protestant clergy in Russia, and the Reformed synod of Wilna send their students hither. D. has a well-known botanical garden. D. was formerly a walled town, and the ramparts still exist, but have been converted into public walks. Pop. est. (1892) 34,897.

DORR, JULIA CAROLINE RIPLEY, b. South Carolina, 1829; was educated in the North, her father having settled in Rutland, Vt., where she was married, 1847. She has published a number of novels, *Laumerc*, *Sibyl Huntington*, *Expiation*, etc.; several volumes of poems, *Vermont*, *Friar Anselmo*, *Afternoon Songs*, *Poems*, etc.; and has been a frequent contributor to periodicals. Her later works include, *Periwinkle* (1893), *The Flower of England's Face* (1895), *A Cathedral Pilgrimage* (1896), etc.

DORR, THOMAS WILSON, 1805-54; b. R. I.; graduate of Harvard, 1823. He was the leader of a party in 1840-41 whose object was to extend the right of suffrage in Rhode Island, it being much restricted by property qualifications, and otherwise. This party framed a new constitution, which was voted on, Dec., 1841, when it was claimed that a clear majority of the male citizens of the state voted for its adoption. In April, 1842, an election for state officers under this constitution was held, and Dorr was chosen governor. In May the new government undertook to organize and assume full power. They were resisted by the regular state government, and made some show of using force, but there was no actual fighting. Before the close of the month the Dorr-ites were scattered, and their leader was arrested, tried for treason, and sentenced to imprisonment for life, June 25, 1844. In 1847, he was released under an act of general amnesty, and in 1851, was restored to civil and political rights.

DORRE ISLAND, lying to the north of Dirk-Hartog island in lat. 25° 10' s., forms, like its southern neighbor, part of the breastwork of Shark Bay, in western Australia.

DORR'S REBELLION. See DORR, THOMAS WILSON.

D'ORSAY, ALFRED GUILLAUME GABRIEL, Count, 1798-1852; a famous leader of society in London and Paris, who was not only the beau ideal of social elegance, but a man of universal intellectual and artistic gifts. Through his mother, by a morganatic marriage, he was a grandson of the king of Würtemberg. When young he served in the French army, and in 1822, while stationed at Valence, on the Rhone, he made the acquaintance of the earl of Blessington and his family, an event which affected the course of his after life. In Dec., 1827, he married lady Harriet Gardner, 15 years of age, the daughter of the earl of Blessington by his first wife. The union was not happy and was dissolved soon after Blessington's death in 1829. The widowed countess was accompanied to England by D'Orsay, and the two lived in the same house, their residence becoming a resort of the fashionable artistic and literary society of London. The count's charming manner, brilliant wit, and artistic faculty were accompanied by benevolent moral qualities which endeared him to all his associates. He was always a Bonapartist, and naturally hastened to Paris in 1849, all the more readily because his home in London had been broken up through bankruptcy. The countess went with him, but died a few weeks after their arrival. He then endeavored to support himself by painting portraits. Only a few before days his death he was appointed director of fine arts.

DORSE (*Gadus callarias*, or *Morrhua callarias*), a fish of the same genus with the cod, haddock, etc.; plentiful in the Baltic and in other northern seas, but scarcely known on the coasts of Britain. It never attains so great a size as the cod, being seldom more than 2 ft. in length, but much resembles it in form and color, although its color is more variable, from which it has received the name of VARIABLE COD. It is also called the BALTIC COD. It differs from the cod in the greater length of the upper jaw. It is in great request on the coasts of the Baltic.

DORSET, EARL OF. See SACKVILLE.

DORSETSHIRE, or **DORSET**, a maritime co. in the s. of England, on the English channel, between Devonshire and Hampshire. Its greatest length is 58 m.; greatest breadth, 40; average, 21; area, 627,265 acres; a third being arable, a ninth waste, and the rest in pasture. The coast-line is 75 m. long, with some cliffs and headlands. St. Alban's Head is 344 ft. high. Portland isle (q. v.) is connected with the mainland by a remarkable formation known as Chesil bank. The surface is uneven and bleak. Chalk downs run along the s. coast, and through the middle of the county nearly from e. to w. The highest point is Pilsdesden Pen, 934 feet. The chief rivers are the Stour and the Frome. Geologically, D. consists of strata of plastic clay, chalk, oolite, lias, with some weald and greensand. Remains of colossal reptiles have been found at Lyme Regis. Pop. '81, 190,979; '91, 194,487.

DORSEY, JAMES OWEN, American anthropologist, was b. in Baltimore, Md., Oct. 31, 1848; was ordained in 1871, and did missionary work among the Indians. From 1878 until his death in 1895, he continued researches in ethnology and linguistics for the Bureau of Ethnology. Among his works are *Omaha Sociology and The Dhegiha Language, Myths, Stories and Letters*; published by the Bureau of Ethnology.

DORSEY, SARAH ANNE, 1829-79; b. Natchez, Miss.; d. New Orleans; daughter of Thos. G. Ellis. She was a student of Sanskrit, and of the Aryan philosophy; and published the novels, *Athalie*, *Lucia Dare*, *Agnes Graham*, and *Panola*. She was widely known for her charities. Mrs. D., who as a slaveholder was attentive to the comfort and religious culture of her slaves, was a warm friend of Jefferson Davis; and left by bequest to his family such estate as the fortunes of the war had spared to her.

DORSEY, STEPHEN W., b. Vt., 1842; received an academic education; served in the civil war; was elected U. S. senator as a republican from Ark., 1872. He was implicated in the "Star Route" scandals, but was acquitted, 1882. He was an efficient worker and leader in the presidential campaign of 1880.

DORSHEIMER, WILLIAM, b. Lyons, Wayne co., N. Y., 1832. He studied at Phillips academy, Andover, and Harvard coll.; practiced law in New York; was U. S. attorney, Northern District of New York, 1867; lieut.-gov. of N. Y., 1874-80; representative from New York in XLVIIIth and XLIXth congresses. He died 1888.

DORSIBRANCHIATES, worms living in mud or sand, or swimming in the sea, whose respiratory organs are in the form of tufts or branchial appendages along the back or sides. One species, the lob-worm, is greatly prized in Europe for fish bait. The eunice, another species, has been known to reach the length of 4 feet.

DORSTENIA. See *CONTRAYERVA*.

DORT, or **DORDRECHT**, a t. of the Netherlands, in the province of South Holland, situated on an island formed by the Maas, about 12 m. s.e. of Rotterdam. An inundation in 1421, in which upwards of 70 villages were destroyed and 100,000 people drowned, separated the site upon which D. stands from the mainland. D. is fortified on the s. side, and its position is naturally so strong, that though frequently besieged, it has never been taken. It is one of the oldest towns in Holland, and some interesting historical particulars attach to it. Here, in 1572, the states of Holland, after their revolt from Spain, held their first assembly, and declared the prince of Orange to be the only lawful governor of the country. In 1618-19, the conclave of Protestant divines known as the synod of Dort, met here and condemned the doctrines of Arminius as heretical, and affirmed those of Calvin. (For an account of the questions at issue, see *ARMINIUS*.) The Gothic buildings in which the synod sat, whose miraculous labors, according to the president's closing address, "made hell tremble," is now used as a public-house, and the particular room in which they met is degraded into a dancing-saloon. Among the principal buildings of D. are a Gothic church with a tall square tower, and containing a beautiful marble pulpit, and the town-hall. The town is traversed by canals, and the Rhine and the Maas afford it great facilities for trade. Large ships can go quite up to the quays. Gigantic wood-rafts, valuing sometimes as much as \$150,000 each, obtained from the Black Forest and Switzerland, come down the Rhine to D., which has numerous saw-mills, ship-building docks, salt and sugar refineries, bleacheries, and manufactures of tobacco, white-lead, etc. It has also considerable trade in corn, flax, oil, timber, and salt fish. Pop., Dec. 31, 1895, 36,089.

DORTMUND, the most important t. of Westphalia, on the Cologne and Minden railway, is situated on the Emscher, 47 m. n.e. of Cologne. It is the center of a mining district, with numerous foundries, and the head-quarters of the mining authorities of Westphalia. D. was formerly surrounded by massive walls, but the greater part of these have been removed, and the town is now quite modern in its aspect. Its history goes back into the earliest middle-age traditions, figuring in the time of Charlemagne under the names of Throtmanni, Tremonia, Trotmunde, and Dortmunde. Subsequently it became a free Hanse town, but was ceded to Prussia in 1815, at the congress of Vienna. The town-hall of D. is one of the oldest in Germany. D. is an important railway center, and manufactures railway material on a large scale. Coal and iron are wrought in the neighborhood; and in D. are a great number of beer-breweries. Pop. '95, 111,235.

DORY, *Zeus*, a genus of fishes, the type of a family, *zeidae*, which is sometimes regarded as merely a group of the great family of *scomberidae*, but is at least a very distinct group, characterized not only by an oval and much compressed form of body, but also by a protractile mouth. The teeth are feeble. The species of *zeidae* are distributed in the seas of all parts of the world (see **BOAR-FISH** and **ОРАН**). In the *D.* genus, the general surface of the body is smooth and destitute of scales, but spiny scales or bony shields guard the dorsal and ventral edges. The anterior portions of the dorsal and anal fins are spiny, and are very distinctly separated from the spineless portions; the spines of the dorsal fin are prolonged into long filaments, and the tail-fin is rounded. The British species (*zeus faber*), popularly known as the **JOHN DORY**, sometimes attains a considerable size. It is principally found on the southern, and particularly the south-western coasts of England, visiting them apparently in pursuit of pilchards; but becomes more rare towards the north. The name *D.* is generally supposed to be properly *dorée* (gilt), and to refer to the prevailing yellowish color and golden luster of the fish; whilst the familiar appellation, *John*, is in like manner derived from *jaune* (yellow). The *D.* has a remarkable dark spot in each side. An idle legend refers these spots to the finger and thumb of St. Peter, and the *D.* thus disputes with the haddock the honor of being reputed the fish from whose mouth he took the tribute-money. Other species of *D.*, very similar to the European, are found in the seas of other parts of the world—one of them Australian, exhibiting similar dark spots.

DOSITHEANS, named after their founder Dositheus, who was a companion of Simon Magus, in the 1st c. A.D. Various stories are told of Dositheus; that he claimed to be the Messiah, and that after the death of John the Baptist, he assumed to take the place of that leader. The Samaritan high-priest ordered his arrest, when he took refuge in a cave, and is said to have starved to death.

DOSTOIEVSKI, FEDOR MIKHAILOVITCH, a Russian novelist, was born in Moscow in 1822. His first book was *Poor People*, published in 1846. Condemned to death for his liberal tendencies in 1849, his punishment was commuted to banishment to Siberia, and he was subsequently pardoned. In 1861 *The Downtrodden and the Oppressed* appeared, and in 1867 *Evil Hearts and Crime and Punishment*. He started in 1876 *An Author's Journal*. His other works include *The Idiot* (1869) and *Podrostok* (1875). He died universally lamented by educated Russians, Feb. 9, 1881.

DO'TIS, or **TOTIS**, a t. in the n. w. of Hungary, district of **Komorn**, and 37 m. w.n.w. of Pesth. Between the town proper and its suburb, called *Lake Town*, from its situation on a small lake, are the remains of an old castle, said to have been a favorite residence of Mathias Corvinus, the Hungarian king. *D.* contains a splendid château, the property of the Esterházy family. The city has sulphur springs, and in the neighborhood are valuable marble quarries. Pop. about 10,000.

DOTTEREL, *Charadrius morinellus*, a species of plover (q. v.), which in summer inhabits the northern parts of Europe and Asia, breeding chiefly in the highest latitudes, and migrates on the approach of winter to the countries around the Mediterranean and those of similar climate. It appears in Britain as a bird of passage, both on its northward migration in spring, and on its southward migration in autumn. Some breed in the mountains both of Scotland and England, always at very considerable elevations. The *D.* is about nine inches and a half in its whole length. In summer plumage, the upper parts are of a brownish ash color, the feathers edged with deep red; the cheeks, throat, and a band above the eyes, white; the breast, bright rust color, with a white gorget on the upper part of it, bounded above by a blackish line; a conspicuous black patch on the middle of the belly; some of the tail-feathers tipped with white. The *D.* has become proverbial for stupidity; but the readiness with which it allows itself to be approached seems to be entirely owing to its coming from regions little frequented by man, and it becomes shy and watchful after a little experience. It is much esteemed for the table, and well known in the London market.

DOUAI, or **DOUAY**, a t. of France, in the department of Nord, situated on the river Scarpe, about 20 m. s. of Lille. It is a dull, lifeless place, but is surrounded with walls, and is strongly fortified. The principal buildings are the churches, the Hôtel de Ville, the public library, the museum, a hospital, and the old buildings of the English college. It contains several good schools and an arsenal. Among the manufacturing establishments are salt and sugar refineries, breweries, and file factories, and there is an active trade in corn, seed, and linen. Pop. '96, 31,397. *D.* has existed since Roman times. It was long a bone of contention between the Flemish counts and the French rulers. It passed with the rest of Flanders under the dominion of Spain, but was taken by Louis XIV. in 1667. Marlborough captured it in 1710, but the French re-occupied it after his withdrawal, and were finally confirmed in the possession of it by the peace of Utrecht. —The *English Catholic College* at *D.*, long the sole or chief theological seminary for English-speaking Catholics, was founded by Dr. William (afterwards Cardinal) Allen in 1568. By reason of political difficulties with the Spanish authorities, then in possession of the town, the college was transferred to Rheims in 1578; but in 1593, it was again established at *D.*, and there it flourished till the French revolution, when it was broken up. Subsequently it was re-established on a smaller scale by the Benedictine fathers, and is still conducted by them.

DOUAY BIBLE. See BIBLE.

DOUAY, FÉLIX CHARLES, 1816-79; a native of France; served as a capt in the siege of Rome in 1849, and in the Crimean war, where he rose to brig.-gen. He was in Mexico with Maximilian, serving as gen. of division. In the Franco-German war he led the 7th army corps, and was taken prisoner at Sedan. In Paris he led the 4th army corps against the commune. He was the first to enter Paris, May 21, and saved the Louvre from entire destruction.

DOUBLE-BASS, the largest stringed instrument played with the bow. The double-bass is the foundation of the orchestra, for to it is given the lowest part of the harmony. It probably received its name because it often doubles in the lower octave the bass of the harmony given to the bassoon, violoncello, or some other instrument. Only in the beginning of the 19th century independent parts were assigned to this instrument. Whether it was invented before the violin is unknown. Its origin is attributed to Gaspar di Salo in 1580, but he may have only added improvements to an instrument that already existed. The double-bass was first used in the orchestra about 1696. It was originally mounted with three strings, but is now used with four strings tuned in E, A, D, and G, and the notes sound an octave lower than written. The double-bass is an orchestral rather than solo instrument, but a few persons have excelled as virtuosi upon it, i. e., Dragonetti (1755-1846) and Bottesini (1822-89).

DOUBLEDAY, ABNER, b. N. Y., 1819; graduate of West Point, and a civil engineer. In the Mexican war he served in the artillery, and became capt. It is said that he fired the first gun on the union side in the war of the secession, at Fort Sumter, April 12, 1861. He rose to be maj.-gen. of volunteers; retired, 1873. He d. in 1893.

DOUBLE CONSCIOUSNESS. Double or divided consciousness has likewise been designated double personality. The term comprehends a group of morbid mental conditions involving some modification in the clearness of the idea of personal identity. Individuals are often encountered with confused notions of the "me" and "not me," others conceive that parts or properties of their frame belong to another person, or that they are inhabited and ruled by a spirit or entity acting in opposition to their will and interests; and there are others who, at different times and under different circumstances, such as when influenced by, or free from moral or physical stimulation, conceive that they are different persons, and endowed with different qualities and powers. These manifestations, however, do not fully illustrate the state under consideration, which has been described as exhibiting, in some measure, two separate and independent trains of thought, and two independent mental capabilities in the same individual, each train of thought and each capability being wholly dis severed from the other, and the two states in which they respectively predominate, subject to frequent interchanges and alterations. In the most marked or perfect form of this phenomenon, the individual is conscious of the two independent trains of thought, and conceives, in consequence of the apparent independence of these, that he is two distinct persons at the same time. There are few instances of this mental affection on record (see Wigan *On Duality of Mind*, Abercrombie's *Inquiry into Intellectual Powers*, Ellicot in Combe's *System of Phrenology*, 3d edition). A servant-girl, at the period of puberty, gave evidence of double personality for three months. In an advanced stage of the affection, the circumstances which occurred during the paroxysm were completely forgotten by her when it was over, but were perfectly remembered during subsequent paroxysms. She was, for example, taken to church while in her abnormal state. She shed tears during the sermon, particularly during an account given of the execution of three young men, who had described, in their dying declarations, the dangerous steps with which their career of vice and infamy commenced. When she returned home, she recovered in a quarter of an hour, was quite amazed at the questions put to her about the sermon, and denied that she had been in church; but next night, when taken ill, she mentioned that she had been there, repeated the words of the text, and gave an accurate account of the tragical narrative of the three criminals by which her feelings had been so powerfully affected (*Philosophical Transactions*, Edin. 1822). This description assimilates the patient to the class of somnambulists. But such perversions of the faculties generally involve a more palpable and complete duality of mind. The personal identity seems to be lost or impaired. A. B. conceived that he was himself and another person at the same time; he acted as if this belief were sincere, and could not divest himself of the conviction that in his body were two minds or persons suggesting courses of conduct widely opposed. He was certain that his original self, A. B., was a base, abandoned scoundrel, tempting his other, or new, or better self—to whom, it should be noted, was attached the emphatic *Ego*—to commit crimes or acts of which he altogether disapproved. The second person in this duality repelled, struggled with these abominable solicitations, such as that he should commit suicide; and loathed the tempter or first person. This struggle sometimes became real and visible, when the hands, acting under the will of No. 2, or the virtuous and opposing principle, beat and bruised the legs, body, or head, which, it may be presumed, were supposed to belong to No. 1, the vicious or tempting impulse. The object of the one was obviously to inflict pain upon the other. The blows were so severe as to leave marks for days; and when these were adverted to, the answer was, as if from No. 2, "Don't justify him, he deserved it." Such conflicts generally occurred during the night, and the interference of the night-watch was required to part or pacify

the combatants. In this case the manifestations of disease might be attributed to the abstruse inquiries of the mind during health. See CEREBRATION, UNCONSCIOUS.

DOUBLE COUNTERPOINT. See COUNTERPOINT.

DOUBLE ENTENDRE (*double meaning*), an expression capable of being taken in two senses, one of which is often questionable, while the other is innocent.

DOUBLE ENTRY. See BOOK-KEEPING.

DOUBLE FLAT, a musical character used to lower the note before which it is placed two half-tones.

DOUBLE FLOWERS. See FLOWER.

DOUBLE FUGUE. See FUGUE.

DOUBLE REFRACTION. If a crystal of pure carbonate of lime, known as Iceland spar, be laid over a printed page, two distinct views of the letters will be seen through the transparent stone. The letters in the two images will have a fainter color than the original, except when the two images overlap. The production of two images in this manner is called double refraction. If the crystal is made to rotate while always in contact with the paper, one of the images of a dot will be seen to rotate, while one remains unmoved. The stationary image is called the ordinary, the moving one the extraordinary image. The rays which form the ordinary image follow the common law of refraction of light. The others have a different index of refraction. Other crystals besides Iceland spar are doubly refractive. For an elaborate demonstration of the causes of this effect, see Lloyd's *Wave Theory of Light*, London, 1873.

DOUBLE SHARP, a musical character the reverse of the double flat.

DOUBLE STARS. As seen by the naked eye all stars appear to be single, but the telescope shows us that many are double, while it resolves others into several distinct bodies. In some instances telescopes of low power suffice to reveal the separation; others require instruments of the largest kind and very delicate adjustment. The object-glass especially needs to be free from all defects. Sometimes one of the components of a double star may hide another from view, and in other instances, while they are apparently near, they may yet be far from each other in almost the same line of sight. In certain cases, Herschel found that one of the components described an orbit about the other. A star which is single to ordinary vision, but which may be resolved into two stars thus physically related, is called a binary star. The components of the same star are almost invariably of a different color. The colors of some double stars, however, are complementary, producing together white light. Eight of the stars known to be physically double have periods of revolution less than a century, while about 400 appear to have a period of more than 1000 years for this process.

DOUBLE-STOPPING, the simultaneous sounding of two notes on a stringed instrument. The playing of double-stops is one of the most difficult tasks in the technique of the violin.

DOUB'LET (so called from being originally lined or wadded for defense) was a close, tight-fitting garment, the skirts reaching a little below the girdle. It was almost identical with the jerkin. The sleeves were sometimes separate, and tied on at the arm.

DOUBLET, a counterfeit gem composed of two pieces of crystal with a layer of color between them, giving the effect of a genuine colored stone. A species of lapidary counterfeiting practiced in early times as at the present day.

DOUBLING THE CUBE was a celebrated geometrical problem among the ancients. The object was to find the side of a cube whose content should be twice that of another given cube; and various accounts are given of how the problem was suggested. One legend brings the matter into connection with Delos (hence the name of "the Delian problem"), and relates that the oracle of Apollo in that island, being consulted by the inhabitants during the prevalence of a pestilence, gave for answer, that they should make the altar of Apollo, which was in the form of a cube, as large again. This was done, and yet the pestilence continued; and the oracle being again consulted, replied, that the altar must retain its cubic form, which had not been attended to in the enlargement. This problem perplexed the Delians, as it did mathematicians of after-ages. Even Plato, whom they consulted on the difficulty, could give them no solution, and had recourse, according to the story, to evasion.

The problem, however, is older than Plato; before his time, it had occupied Hippocrates of Chios (not the physician Hippocrates), and was studied afterwards by Eratosthenes, Nicomedes, Hero, and others. Apollonius applied conic sections to the solution of the question, as did also Menæchmus; Nicomedes invented a curve, which he called the conchoid, for the express purpose, and Diocles the cissoid. The analytical method introduced into geometry by Descartes showed this problem in its true light. It was seen to be only a special case of the solution of a cubic equation—a solution which is impossible by geometry, i.e., by the use of the circle and straight line. It may, however, be represented by the intersection of two conic sections, of which one may be a circle. Descartes made use of the parabola with the circle, which is the simplest way. With numbers, the question is merely one of the extraction of the cube

root. If the side of a cube be one foot, its solid content is $1 \times 1 \times 1 = 1$ cubic foot. The side of a cube of double that content, or 2 cubic feet, is $\sqrt[3]{2} = 1.259,921$.

DOUBLOON (Sp. *dublone*, double) is the name of a gold piece coined in Spain and Spanish America. The dublon de Isabella, coined since 1848, is of 100 reals, and equivalent to 25.84 French francs, or \$5.00. The older Spanish doubloons vary in value from 85 to 81 francs.

DOUBS, a department of France, on the eastern frontier, separated from Switzerland by the Jura mountains, is situated in lat. $46^{\circ} 35'$ to $47^{\circ} 31'$ n., and long. $5^{\circ} 42'$ to $7^{\circ} 4'$ east. Area about 2018 sq. miles. Pop. '96, 302,046. D. is traversed by the river Doubs, a tributary of the Saone, and is separated, on the n.w., from the department of Haute Saone by the Oignon, also a tributary of the Saone. The surface is hilly, being crossed by four parallel ranges of the Jura mountains. The climate is more rigorous than in most similar latitudes. The pine and the walnut attain a huge size, and the common orchard trees thrive well. Mines of iron and coal are worked, and gypsum and marble are abundant. The trade is principally in iron, cattle, horses, and dairy produce. D. is divided into the four arrondissements of Besançon, Baume-les-Dames, Montbelliard, and Pontarlier. The capital of D. is Besançon.

DOUCHE. See BATH and HYDROPATHY.

DOUGH is the name given to the moistened and kneaded flour in the first stage of making bread (q.v.).

DOUGHERTY, a co. in s.w. Georgia, on Flint river; 312 sq.m.; pop. '90, 12,206. It is level and fertile, producing corn, oats, cotton, etc. Co. seat, Albany.

DOUGHFACES, a contemptuous nickname applied to the northern abettors of negro slavery. It has been suggested that the name was derived from an appreciation of the kneadable character of dough. "J. R. Lowell explains the term in his *Catalogue Raisonné* as meaning, 'A contented lickspittle, a common variety of Northern politicians,' and alludes to it again in the lines,

Each hon'able *doughface* gets jest wnt he axes,
An' the people—thur annual soff sodder and taxes.

—*Biglow Papers*, I, p. 51.

"It is said that John Randolph, of Roanoke, in denouncing the famous Missouri Compromise as a 'dirty bargain,' also branded the eighteen northern congressmen, who helped to displace Mason and Dixon's line, as *doughfaces*, and that the epithet at once passed into the slang dictionary of politics." (De Vere's *Americanisms*, p. 280.)

DOUGHNUTS are cakes compounded of flour, sugar, etc., raised with yeast, and fried in hot lard. Crullers, which are made in a similar manner, but without the addition of yeast, are frequently and incorrectly called doughnuts.

DOUGLAS, a co. in Colorado, n.e. of the centre; 840 sq.m.; pop. '90, 3006. The bottom lands are fertile; other parts are more adapted to grazing. Coal and iron are found. Productions chiefly agricultural. Co. seat, Castle Rock.

DOUGLAS, a co. in n.w. Georgia, formed after the census of 1870. It is on the Chattahoochee river, and has an area of about 178 sq. miles. Cotton and corn are the chief productions, and minerals are found. Co. seat, Douglasville. Pop. '90, 7794.

DOUGLAS, a co. in e. Illinois, on Kaskaskia and Embarras rivers; 410 sq.m.; pop. '90, 17,669. It has a level surface and fertile soil, producing corn, oats, wheat, wool, and butter. Co. seat, Tuscola.

DOUGLAS, a co. in e. Kansas, on the Kansas river; 469 sq.m.; pop. '90, 23,961. It is of rolling upland, with a black loamy soil, producing corn, wheat, butter, etc. Co. seat, Lawrence.

DOUGLAS, a co. in w. Minnesota; 720 sq.m.; pop. 1890, 14,606. The surface is mostly level, and there are many small lakes. Productions agricultural. Co. seat, Alexandria.

DOUGLAS, a co. in s. Missouri, on the upper waters of the White river; 792 sq.m.; pop. '90, 14,111. The surface is hilly, much of it still covered with forests. Lead ore is found. The productions are chiefly agricultural. Co. seat, Ava.

DOUGLAS, a co. in e. Nebraska, on the Missouri river, bounded on the w. by the Platte; 330 sq.m.; pop. '90, 158,008. The soil is fertile, and the surface an undulating prairie. Productions agricultural. Co. seat, Omaha.

DOUGLAS, a co. in w. Nevada, on the California border; 892 sq.m.; pop. '90, 1551. It is a rough region, but embraces the most fertile portion of the Carson valley. There are pine forests in the mountains, and water-power is abundant. Gold, silver, and copper are found, but mining is not prosecuted to any great extent. Productions agricultural. Co. seat, Genoa.

DOUGLAS, a co. in s. Oregon, on the Umpqua river; 4875 sq.m.; pop. '90, 11,864. Productions, wheat, corn, barley, butter, wool, etc. Co. seat, Roseburg.

DOUGLAS, a co. in southern S. Dakota, formed in 1873; drained by branches of the Dakota river; 450 sq. m.; pop. '90, 4400. Co. seat, Armour.

DOUGLAS, a co. in the e. central part of Washington; formed, 1883, from Stevens co., and mainly bounded by the Columbia r.; about 4552 sq. m.; pop. '90, 3161. The soil is adapted to farming and stock raising. Co. seat, Waterville.

DOUGLAS, a co. in n.w. Wisconsin, on lake Superior and the Minnesota border; 1336 sq. m.; pop. '90, 13,468. Agriculture is the principal business. Co. seat, Superior.

DOUGLAS, the largest t. and principal seaport of the Isle of Man, is so called from its being situated near the junction of two streams—the *Dhoo* (black) and *Glass* (gray). D. lies on the margin of a highly picturesque bay, on the e. side of the island. From the excellence of the sea-bathing, and its central position, it is fast increasing in importance as a watering-place. The old town, standing on the south-western edge of the bay, consists of narrow, tortuous streets, and presents a vivid contrast to the handsome modern terraces and villas which occupy the rising ground beyond. A landing pier 1500 feet in length makes it unnecessary for passengers to land in small boats, as they formerly were obliged to do. There is also another pier 520 feet long, with a lighthouse at the end. Conspicuous in the center of the crescent of the bay stands castle Mona, formerly the residence of John, duke of Athol, but now converted into a first-class hotel. The tower of refuge, a picturesque object, occupies a dangerous rock, in the southern area of the bay, called Conister, and was erected in 1833 for the safety of shipwrecked mariners, by the late sir William Hillary, bart., who, during his residence at D., founded the royal national lifeboat institution. D. is the principal packet station of the island, and possesses telegraphic communication with England. Pop. '91, 19,515.

DOUGLAS, THE FAMILY OF. Archæology has failed in its efforts to pierce the obscurity which veils the origin of the heroic race of which it has been said:

So many, so good as of Douglas blood have been,
Of one surname, in one kingrick, never yet were seen.

A legend of the 16th or 17th c. told how, about the year 770, a Scottish king, whose ranks had been broken by the fierce onset of a lord of the isles, saw the tide of battle suddenly turned by an unknown chief; how, when the victory was won, the monarch asked where was his deliverer; how the answer ran in Erse, *Sholto Du-glas* ("Behold that dark-gray man"); and how the warrior was rewarded with that Clydesdale valley which, taking from him its name of Douglas, gave surname to his descendants. This fable has long ceased to be believed. Equal discredit has fallen on the theory which, 60 years ago, the laborious Chalmers advanced in his *Caledonia*, that the Douglasses sprang from a Fleming of the name of Theobald, who, between the years 1147 and 1164, had a grant of lands on the Douglas water from the abbot of Kelso. There is no trace of any connection between the Flemish Theobald and the Douglasses; nor were the lands which he acquired on one side of the stream any part of their old domain on the other. What was boasted of the Douglasses by their historian, two centuries ago, therefore still holds true: "We do not know them in the fountain, but in the stream; not in the root, but in the stem; for we know not who was the first mean man that did by his virtue raise himself above the vulgar." It was thought likely, in the beginning of the 15th c., that the Douglasses and the Murrays had come of the same stock, and in this old conjecture all that is known on the subject must still be summed up.

1. *William of Douglas*, the first of the family who appears in record, was so-called, doubtless, from the wild pastoral dale which he possessed. He is found witnessing charters by the king and the bishop of Glasgow between 1175 and 1213. He was either the brother or the brother-in-law of sir Freskin of Murray, and had six sons, of whom Archibald, or Erkenbald, was his heir; and Brice, a monk of Kelso, rose to be prior of Lesmahago (a dependency of Kelso, on the outskirts of Douglasdale), and in 1203 was preferred to the great bishopric of Murray. He owed this promotion, no doubt, to the influence of his kinsmen the Murrays, and it contributed not a little to the rising fortunes of his own house. He was followed beyond the Spey by four brothers, of whom one became sheriff of Elgin; another became a canon of Murray; a third, who had been a monk of Kelso, seems to have become archdeacon of Murray; and a fourth, who had been parson of Douglas, appears to have become dean of Murray.

2. *Sir Archibald, or Erkenbald, of Douglas* is a witness to charters between 1190 and 1232. He attained the rank of knighthood, and beside his inheritance of Douglas, held the lands of Hailes, on the Water of Leith, from the monks of Dunfermline, and had a grant of the lands of Levingston and Hirdmanston from the earl of Fife. He is said to have acquired other lands in Clydesdale by his marriage with one of the two daughters and heiresses of sir John of Crawford.

3. *Sir William of Douglas*, apparently the son of sir Archibald, figures in record from 1240 to 1273. He appears in 1255 as one of the Scottish partisans of king Henry III. of England; and in 1267, is found in possession of the manor of Fawdon, in Northumberland, by gift of the king's son (afterwards Edward I.). He seems to have had a brother, sir Andrew, the progenitor of the Douglasses of Dalkeith and Morton, and certainly had two sons.

4. *Hugh of Douglas*, the elder, acquired land in Glencorse, in Lothian, by marriage with the sister of sir Hugh of Abernethy; and dying without issue about 1287, was succeeded by his younger brother.

5. *Sir William of Douglas*, distinguished in the family traditions as *William the Hardy*, had all the daring and restless spirit which was characteristic of his descendants. His first appearance is in 1267, when his head was nearly severed from his shoulders in defending his father's English manor from a foray of the men of Redesdale. Twenty years later, he is found at the head of an armed band, carrying off his future wife, a wealthy widow, Alionora of Lovaine, from the manor of her kinsfolks, the La Zouches, at Tranent, in Lothian. We hear of him immediately afterwards as spoiling the monks of Melrose, deforcing the king's officers in the execution of a judgment in favor of his mother, unlawfully imprisoning three men in his castle of Douglas, and beheading one of them. He was the first man of mark who joined Wallace in the rising against the English in 1297; and for this his lands of Douglas were wasted with fire and sword, and his wife and children carried off by Robert Bruce, the young earl of Carrick, then a partisan of England. But the knight of Douglas soon left the insurgent banners, and submitting to his old patron, king Edward I., to whom he had again and again sworn fealty, was sent prisoner to the castle of York, where he died about 1302. It appears that he possessed lands in one English, and in seven Scottish counties—Northumberland, Berwick, Edinburgh, Fife, Lanark, Ayr, Dumfries, and Wigton.

6. The history of his son, *the Good Sir James of Douglas*, is familiar to every one, as Bruce's greatest captain in the long war of the succession. The hero of seventy fights, he is said to have won them all but thirteen, leaving the name of "the black Douglas"—so he was called from his swarthy complexion—as a word of fear by which English mothers stilled their children. He was slain in Andalusia, in 1330, on his way to the Holy Land with the heart of his royal master, and dying unmarried, was succeeded by his brother.

7. *Hugh of Douglas*, of whom nothing is known except that he made over the now great domains of his family, in 1342, to his nephew *Sir William of Douglas* (son of a younger brother of the good sir James—sir Archibald of Douglas, regent of Scotland, slain at Halidon hill in 1333).

EARLS OF DOUGLAS.—Hitherto, the Douglasses had no higher title than that of knight; but in 1357, sir William of Douglas, who had fought at Poitiers, and distinguished himself in other fields, was made earl of Douglas, and afterwards by marriage became earl of Mar. His ambition aimed at still greater things, and in 1371 he disputed the succession to the Scottish crown with Robert II. (the first of the Stewarts). He claimed as a descendant of the Baliols and Cummings; and his pretensions were abandoned only on condition that his son should marry the king's daughter. He died in 1384. His son James, second earl of Douglas and Mar, the conqueror of Hotspur, fell at Otterburn in 1388; and as he left no legitimate issue, the direct male line of William the Hardy and the good sir James now came to an end. His aunt had married for her second husband one of her brother's esquires, James of Sandilands, and through her lord Torphichen is now the heir general and representative at common law of the house of Douglas.

The earldom of Douglas, meanwhile, was bestowed on an illegitimate son of the good sir James—Archibald, lord of Galloway, surnamed the Grim. By his marriage with the heiress of Bothwell, he added that fair barony to the Douglas domains; and having married his only daughter to the heir-apparent of the Scottish crown, and his eldest son to the eldest daughter of the Scottish king, he died in 1401. His son and successor, Archibald, fourth earl of Douglas, was, from his many misfortunes in battle, surnamed "the Tyneman," i.e., the loser. At Homildon, in 1402, he was wounded in five places, lost an eye, and was taken prisoner by Hotspur. Next year, at Shrewsbury, he felled the English king to the earth, but was again wounded and taken prisoner. Repairing to France, he was there made duke of Touraine, and fell at Verneuil in 1424. He was succeeded by his son Archibald, who distinguished himself in the French wars, and dying in 1439, was buried in the church of Douglas, where his tomb yet remains, inscribed with his high titles of "duke of Touraine, earl of Douglas and of Longueville, lord of Galloway, Wigton, and Annandale, lieutenant of the king of Scots." His son and successor, William, a boy of sixteen, is said to have kept a thousand horsemen in his train, to have created knights, and to have affected the pomp of parliaments in his baronial courts. His power and foreign possessions made him an object of fear to the Scottish crown; and, having been decoyed into the castle of Edinburgh by the crafty and unscrupulous Crichton, he was, after a hasty trial, beheaded, along with his brother, within the walls of the castle, in 1440. His French duchy and county died with him; his Scottish earldom was bestowed on his grand-uncle (the second son of Archibald the Grim), James, surnamed the Gross, who in 1437 had been made earl of Avondale. He died in 1443, being succeeded by his son William, who, by marriage with his kinswoman (the only daughter of Archibald, fifth earl of Douglas, and second duke of Touraine), again added the lordship of Galloway to the Douglas possessions. He was, for a time, all-powerful with king James II., who made him lieutenant of the realm; but afterwards losing the royal favor, he seems to have entered into a confederacy against the king, by whom he was killed in Stirling castle, in 1452. Leaving no child, he was succeeded by his brother James, who, in 1454, made open war against king James II., as the murderer of his brother and kinsman (the sixth and eighth earls of Douglas). The issue seemed doubtful for a time,

but the Hamiltons and others being gained over to the king's side, Douglas fled to England. The struggle was still maintained by his brothers, Archibald, who by marriage had become earl of Murray, and Hugh, who in 1445 had been made earl of Ormond. They were defeated at Arkinholm in May, 1455, Murray being slain on the field, and Ormond taken prisoner, and afterwards beheaded. Abercorn, Douglas, Strathaven, Thrieve, and other castles of the Douglasses, were dismantled; and the earldom of Douglas came to an end by forfeiture, after an existence of 98 years, during which it had been held by no fewer than nine lords. The last earl lived many years in England, where he had a pension from the crown, and was made a knight of the garter. In 1484, he leagued himself with the exiled duke of Albany to invade Scotland. He was defeated and taken prisoner at Lochmaben, and, on being brought to the royal presence, is said to have turned his back upon the king. The compassionate James III. spared his life, on condition of his taking the cowl. "He who may no better be, must be a monk," muttered the old man, as he bowed to his fate. He died in the abbey of Lindores, in April, 1488; and so ended the elder illegitimate line of the Douglasses.

EARLS OF ANGUS.—Meanwhile a younger illegitimate branch had been rising to great power. William, first earl of Douglas, was the faithless husband of a faithless wife. She was believed to have had a paramour in sir William Douglas of Liddesdale. Her jealous husband, who slew that "flower of chivalry," had himself shared the affections of the wife of his wife's brother, Margaret Stewart, countess of Angus and Mar. The issue of this amour, which in that age was accounted incestuous, was a son George, who, in 1389, had a grant of his mother's earldom of Angus; married, in 1397, the youngest daughter of king Robert III.; was taken prisoner at Homildon in 1402, and died of the plague in England in the following year. He was succeeded by his son William, who, dying in 1437, was succeeded by his son James, who died without issue, when the title reverted to his uncle. George, fourth earl of Angus, took part with the king against the Douglasses in 1454; his loyalty was rewarded by a grant of their old inheritance of Douglasdale; and so, in the phrase of the time, "the Red Douglas"—such was the complexion of Angus—"put down the Black." He died in 1462, being succeeded by his son Archibald, surnamed Bell-the-Cat, and sometimes also called the great earl. After filling the highest offices in the state, and adding largely to the family possessions, he retired to the priory of canons regular at Whithorn, in Galloway, where he died in 1514. Having outlived his eldest son, he was succeeded by his grandson, Archibald, who, in 1514, married the queen-dowager of Scotland, Margaret, sister of Henry VIII. of England, and widow of James IV. of Scotland. The fruit of this marriage was a daughter, Margaret, who, marrying the earl of Lennox, became the mother of Henry, lord Darnley, the husband of queen Mary, and father of king James VI. The earl of Angus had, for a time, supreme power in Scotland, but in 1528, the young king, James V., escaped from his hands, and sentence of forfeiture was passed against Angus and his kinsmen. The king swore that while he lived the Douglasses should have no place in his kingdom; and he kept his vow. On his death in 1542, Angus returned to Scotland, and was restored to his honors and possessions. He died at Tantallon in 1556. His nephew, who succeeded him, died two years afterwards, leaving an only son, Archibald, eighth earl of Angus. This "good earl," as he was called, died in 1588, when his title devolved on his kinsman William, the grandson of sir William Douglas of Glenbervie, second son of Archibald Bell-the-Cat. Dying in 1591, he was succeeded by his son William, who next year obtained from the crown a special recognition of his high privileges as earl of Angus, of taking the first place and giving the first vote in parliament, of leading the vanguard in battle, and of bearing the crown in parliament. He seems to have been a man of scholarly tastes, and is said to have written a history of the Douglasses. Having turned Roman Catholic, he was forced to leave Scotland, and spent his latter years in exercises of devotion at Paris, where he died in 1611, being succeeded by his son.

MARQUISES AND DUKE OF DOUGLAS, AND LORDS DOUGLAS.—William, eleventh earl of Angus, was created marquis of Douglas in 1633, and dying in 1660, was succeeded by his grandson James, who died in 1700, leaving issue one son and one daughter. The son Archibald, third marquis of Douglas, was created duke of Douglas in 1703, and died childless in 1761, when his dukedom became extinct, and his marquiseate devolved on the duke of Hamilton, as descended in the male line from William earl of Selkirk, third son of the first marquis of Douglas. His grace's sister, lady Jane Douglas, born in 1698, and married in 1746 to sir John Stewart of Grandtully, was said to have given birth at Paris to twin sons in 1748. One of them died in 1753; the other, in 1761, was served heir of entail and provision general to the duke of Douglas. An attempt was made to reduce his service, on the ground that he was not the child of lady Jane Douglas; but the house of lords, in 1771, gave final judgment in his favor. He was made a British peer in 1790, by the title of baron Douglas of Douglas castle, which became extinct on the death of his son James, fourth lord Douglas, in 1857, when the Douglas estates devolved on his niece, the countess of Home. The title of earl of Angus was claimed in 1762, as well by the duke of Hamilton as by Archibald Stewart, afterwards lord Douglas; but neither urged his claim to a decision, and the title is still in abeyance. The right attached to it of bearing the crown of Scotland, was debated before the privy council in 1823, when it was ruled that lord

Douglas's claim to that honor, being a claim of heritable right, fell to be decided in a court of law. It has been supposed that the motto of the Douglas arms, *Jamais arrière*, "Never behind," alludes to the peculiar precedence inherent in their earldom of Angus. The bloody heart commemorates Bruce's dying bequest to the good sir James; the three stars which the Douglasses bear in common with the Murrays, seems to denote the descent of both from one ancestor.

EARLS OF MORTON.—Sir Andrew of Douglas, who appears in record in 1248, was apparently a younger son of sir Archibald, or Erkenbald, of Douglas, the second chief of the house. He was the father of William of Douglas, who, in 1296, swore fealty to king Edward I. for his lands in West Lothian, and who was probably the father of sir James of Douglas—surnamed of Lothian, to distinguish him from his kinsman of Clydesdale—who, in 1315, had a grant from Bruce of the lands of Kincavil and Calder-clere. He died about 1320, being succeeded by his son, sir William of Douglas of Liddesdale, who acquired the lordship of Dalkeith (by resignation of the Grahames), the barony of Aberdour in Fife, lands in Tweeddale, and great territories in Liddesdale, Eskdale, and Ewesdale which had been forfeited by the Soulics and Lovels. In 1335, he had a grant of the earldom of Athol, but resigned it in 1342. The knight of Liddesdale—as he was called by his contemporaries, who regarded him as "the flower of chivalry"—was assassinated in 1253 by his kinsman, William first earl of Douglas, partly to revenge his wife's dishonor, partly to revenge the death of sir David of Barclay, who had been assassinated at the instance of the knight of Liddesdale, in revenge for the slaughter of his brother John. Dying childless, he was succeeded by his nephew, sir James of Douglas of Dalkeith. This great chief, who died in 1420, saw Froissart sit as a guest at his board; himself possessed books of law, grammar, logic, and romance; and enjoined in his will that all the volumes which he had borrowed from his friends should be returned to them. His alliances were as princely as his life. His first wife was a daughter of "Black Agnes," the heroic countess of Dunbar; his second was a sister of king Robert II.; and he matched his eldest son, sir James of Douglas of Dalkeith, with a daughter of king Robert III. Their grandson married a daughter of king James I., and in 1458, was created earl of Morton. His grandson, the third earl, dying without male issue in 1553, the earldom devolved on his daughter's husband, the regent Morton—James Douglas, great-grandson of Archibald Bell-the-Cat. After his fall, the title went to Archibald eighth earl of Angus; and when he died childless in 1588, it passed to the lineal male descendant of sir Henry of Douglas (the son of sir John of Douglas, the brother of the knight of Liddesdale), sir William Douglas of Lochleven, who thus became seventh earl of Morton. His losses in the great civil war compelled him, in 1642, to sell Dalkeith to the earl of Buccleuch, and his Tweeddale and Eskdale lands to others; but Aberdour and other old domains of the family still remain with his successor, the earl of Morton, who, there is every reason to believe, descends legitimately in the male line from William of Douglas, the great progenitor of the race in the 12th century.

EARLS, MARQUESSES, AND DUKES OF QUEENSBERRY; EARLS OF MARCH, AND EARLS OF SOLWAY.—James, second earl of Douglas and Mar—the hero of Otterburn—had an illegitimate son, sir William of Douglas of Drumlanrig, whose descendants were created viscounts of Drumlanrig in 1628, earls of Queensberry in 1633, marquesses of Queensberry in 1682, dukes of Queensberry in 1684, earls of March in 1697, and earls of Solway in 1706. On the death of the fourth duke of Queensberry in 1810, that title, with the barony of Drumlanrig and other lands, went to the duke of Buccleuch; the title of marquess of Queensberry, with the baronies of Tinwald, Torthorwald, etc., went to the heir-male of the family, sir Charles Douglas of Kelhead; and the title of earl of March, with the barony of Neidpath, went to the earl of Wemyss. The title of earl of Solway had become extinct in 1778.

EARLS OF SELKIRK, FORFAR, AND DUMBARTON; VISCOUNT BELHAVEN, AND LORDS MORDINGTON.—In 1646, the third son of the first marquess of Douglas was created earl of Selkirk. In 1651, the eldest son of the same marquess was created earl of Ormond, and in 1661, earl of Forfar. In 1675, the fourth son of the same marquess was created earl of Dumbarton. In 1641, the second son of the tenth earl of Angus was created lord Mordington. In 1633, sir Robert Douglas of Spot, a descendant of the Morton family, was created viscount of Belhaven. Of all these titles, that of the earl of Selkirk is the only one not now dormant or extinct.

A History of the Houses of Douglas and Angus, by David Hume of Godscroft, was published at Edinburgh in 1644, in 1 vol. fol., and reprinted in 1748 in 2 vols. 8vo. It preserves the traditions of the family, and has some literary merit, but its accuracy is not to be trusted. The earlier history of the Douglasses has been critically examined by the late George Chalmers in his *Caledonia*, vol. i. pp. 579-84 (Lond. 1807); by Mr. Riddell in his *Remarks upon Scotch Peerage Law*, pp. 174-78 (Edin. 1833); by Mr. Cosmo Innes, in the *Registrum Episcopatus Moraviensis*, pp. xlv.-xlvii. (Edin. 1837); and the *Liber S. Marie de Calchou*, vol. i. pp. xxvii., xxviii. (Edin. 1846); and by Mr. Joseph Robertson in the *Origines Parochiales Scotiæ*, vol. i. pp. 152-60 (Edin. 1851). The descent of the houses of Angus and Dalkeith was first ascertained by Mr. Riddell in his *Remarks upon Scotch Peerage Law*, pp. 154-64 (Edin., 1833); and in his *Stewartiana*, pp. 82-4, 137-42. The charters and correspondence of the Morton family have

been edited for the Bannatyne club by Mr. Cosmo Innes in the *Registrum Honoris de Morton* (Edin., 1853, 2 vols. 4to).

DOUGLAS, GAWYN or GAVIN, a Scottish poet, was the third son of Archibald, fifth earl of Angus, and was b. in the year 1474 or 1475. He was educated at St. Andrews for the church, and was early appointed to the rectory of Hawch or Prestonkirk. In 1501 he was made dean or provost of the collegiate church of St. Giles. From the marriage of his nephew, the sixth earl of Angus, to the widowed queen of James IV., Douglas expected rapid preferment; but the jealousy of the nobility and the regent Albany was such that D., who had through the influence of the queen obtained the bishopric of Dunkeld directly from the pope, was tried before the Scottish peers, found guilty of conspiring against the privileges of the crown, and condemned to imprisonment. After reconciliation with the regent, he was set at liberty in about a year, and inducted into his bishopric. Owing to his nephew's ill-treatment of the queen, who thereupon joined with the regent against the Douglasses, Gavin D. was deprived of his bishopric, on which he went to England to obtain the aid of Henry VIII. He was, however, suddenly cut off at London by the plague in 1522, and was buried in the Savoy church. One of D.'s earliest poetic efforts was a translation of Ovid's *Remedy of Love*, but it has not been preserved. In 1501, he wrote his *Palace of Honor*, addressed to king James IV. The leading idea of the poem, and some of the details, resemble Chaucer's *Temple of Fame*. *King Hart*, the only other long poem of D., presents a metaphorical view of human life. But the most remarkable production of this author was a translation of Virgil's *Æneid* into Scottish verse, which he executed in the years 1512 and 1513, being the first version of a Latin classic published in Britain. It is generally allowed to be a masterly performance, though in too obsolete a language ever to be popular. D.'s verse is far from rhythmical to modern ears; yet the felicitous character of his allegories, and the rich beauty of his descriptions, might well tempt the lovers of genuine poetry to give him a trial. A collected edition of his works in four volumes was issued under the superintendence of John Small, M.A., in 1874.

DOUGLAS, GENERAL SIR HOWARD, Bart., G.C.B., son of admiral sir C. Douglas, was b. at Gosport in 1776. Entering the army when young, he served in Spain and Portugal in 1808 and 1809, and again in Spain in 1811 and 1812. He was governor of New Brunswick from 1823 to 1829, lord high commissioner of the Ionian Islands from 1835 to 1840, and from 1842 to 1847 was M.P. for Liverpool. In 1851, he became a gen. in the army, and col. of the 15th regiment of foot. He has written several treatises, among which are *An Essay on the Principles and Construction of Military Bridges*, and *the Passage of Rivers in Military Operations* (Lond. 1816); a treatise on *Naval Gunnery* (1819; 4th edit., 1855); *Observation on Carnot's Fortification*, etc. His treatise on *Naval Gunnery* is regarded as a standard authority in foreign countries, although his recommendations were not acted upon by the British admiralty until 13 years after the publication of his work. He censured the conduct of the war in the Crimea in 1855, and declared that Sebastopol could not be reduced unless by a change in the plan of operations, such as he traced. His prophecy was verified by the event. He also published *Considerations on the Value and Importance of the British and North American Provinces*, and a treatise entitled *Naval Evolutions*. He died Nov., 1861.

DOUGLAS, JOHN, D.D., was the son of a respectable shopkeeper of Pittenweem, Fifeshire, and was b. there in 1721. In 1736, he entered St. Mary's college, Oxford, where he took his bachelor's degree after five years' study. D.'s life is little more than a chronicle of his very numerous preferments, which ended in his being translated to the see of Salisbury in 1791. He died on the 18th May, 1807. D. only occasionally resided on his livings. He generally spent the winter months in London, and the summer months at the fashionable watering-places, in the society of the earl of Bath, who was his great patron. He was devoted to literature; but most of his productions were only interesting to his own time. Among other works chiefly of a pamphlet kind, he wrote a *Vindication of Milton from the Charge of Plagiarism*, adduced by Lauder (1750); *A Letter on the Criterion of Miracles* (1754); an ironical pamphlet against the Hutchinsonians and Methodists, entitled *The Destruction of the French Foretold by Ezekiel* (1759); and the *Introduction and Notes to Captain Cook's Third Voyage* (1781).

DOUGLAS, STEPHEN ARNOLD, 1813-61; a statesman; born Brandon, Vt., d. Chicago. His father, a respectable physician, died when he was two months old, leaving the mother in straitened circumstances. The son lived with her on a farm until he was 15 years old, when he apprenticed himself to a cabinet-maker. Before the end of two years his health failed and he abandoned his occupation. After attending Brandon academy for one year, he removed with his mother to Canandaigua, N. Y., and resumed his studies in the academy there, at the same time beginning to prepare himself for the legal profession. In 1833, he went to Winchester, Ill., walking a part of the way for lack of funds, and opened a school, which he taught for three months, still pursuing his studies for the bar. In 1834, he was admitted to practice and within a year was elected attorney-general for the state. He resigned this office, Dec., 1835, on being elected a member of the legislature. In 1837, he was appointed register of the United States land office at Springfield, but resigned in 1839. In 1837, he was nominated for member of congress by the democratic party, and came very near an election. In 1840,

he was appointed secretary of state of Illinois. In 1841, he was elected a judge of the supreme court of the state by the legislature, but resigned in 1843 to become again a candidate for congress. He was elected this time by over 400 majority, and re-elected for two successive terms. He resigned after his election for the third time, to accept the post of senator of the United States for six years from Mar. 4, 1847. As a member of the house of representatives, he took an active part in the political discussions of the time. In the Oregon controversy he took extreme ground against Great Britain, claiming the whole territory for the United States up to lat. 54° 40'. He was also an earnest advocate for the annexation of Texas, and as chairman of the committee on territories, 1846, reported the joint resolution declaring that country to be one of the states of the American union. He was an ardent supporter of President Polk in the war with Mexico. The bills to organize the territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas, and Nebraska, were all reported by him, as were also those providing for the admission to the union of the states of Iowa, Wisconsin, California, Minnesota, and Oregon. He was a strenuous opponent of the "Wilmot proviso," and of every other measure for resisting the extension of slavery by federal action, holding to the doctrine called "squatter sovereignty"—the doctrine, in other words, that the settlers in a territory had the right to say whether they would have slavery or not. In Aug., 1848, however, he so far relinquished this doctrine as to propose an amendment to the Oregon bill, extending the Missouri compromise line of 36° 30' to the Pacific, thus prohibiting slavery in the region n. of that line, and recognizing it in that s. thereof. The amendment prevailed in the senate, but was lost in the house of representatives. The land was now filled with excitement upon the slavery question, and the compromise measures of 1850 were devised and passed as a "final settlement" of the controversy. Instead of quieting the agitation, however, they fanned it to an intenser heat. In 1852, D. was an unsuccessful candidate for the democratic nomination for president of the United States. During the congressional session of 1853-54, he reported the bill to organize the territories of Kansas and Nebraska, the freedom of which from slavery was solemnly guaranteed by the Missouri compromise of 1820. This restriction Douglas now proposed to repeal or disregard, leaving those territories under the doctrine of "squatter sovereignty," open to the introduction of slavery. The enactment of this measure created intense excitement in the northern states, and D. was hotly denounced. From this time forward the question of the extension or non-extension of slavery was the paramount issue before the country—the compromise measures of 1850 proving utterly abortive as a means of stopping anti-slavery agitation. In 1856, D. was again a candidate for the presidential nomination of his party, but James Buchanan gained the nomination. In 1858, desiring a re-election to the senate, he engaged in a political canvass of the state of Illinois—Abraham Lincoln, the republican candidate for senator, being his antagonist. They spoke from the same platform in regular debate, upon conditions mutually agreed to, in every quarter of the state. A majority of the popular vote was cast against him, but D. carried the legislature by a small majority, and was consequently re-elected to the senate. He was in favor of the annexation of Cuba to the United States, and a warm champion of the Pacific railroad. In the presidential election of 1860, the democratic party was divided, D. being supported by the northern and Breckinridge by the southern section. The republicans nominated and elected Abraham Lincoln. After the beginning of the war between the states, D. took strong ground in favor of the union, giving his influence to uphold the general government. During his last illness, he dictated for publication a letter in which he declared it to be the duty of all patriotic men to sustain the union, the constitution, the government, and the flag, against all assailants. He was short of stature, but stoutly built, and was familiarly called "the little giant." He was endowed with qualities which gave him great power over masses of men. His first wife (1847) was Martha, daughter of Col. Robert Martin of Rockingham co., N. C.; his second, Adele, daughter of James Madison Cutts of Washington. By his first wife he had three children. See *Lives*, by Sheahan (N. Y., 1860); Flint (Phila., 1860).

DOUGLASS, DAVID BATES, 1790-1849; b. N. J.; graduate of Yale, 1813. He went into the army, and was one of the defenders of fort Erie, for which he was breveted captain. In 1815, he was assistant professor of natural and experimental philosophy at West Point; in 1819, astronomical surveyor in fixing the boundary with Canada from Niagara to Detroit, and the next year in the same capacity further west. In 1832, he accepted the professorship of civil architecture in the university of New York, and prepared the designs for the building on Washington Square. He surveyed the region of Croton river, with a view to a supply of water for the city; his plan was accepted, and he was appointed chief engineer. In 1839, he planned and laid out Greenwood cemetery. From 1841 to 1844, he was president of Kenyon college. In after years he laid out cemeteries at Albany and Quebec. His last official position was professor of mathematics and natural philosophy in Hobart college.

DOUGLASS, FREDERICK, American orator and journalist, was born at Tuckahoe, near Easton, Maryland, about 1817. His father was a white man, his mother a negro slave, and he was reared as a slave on the plantation of Col. Edward Lloyd until 10 years old, when he was transferred to a relative of his owner at Baltimore. There he

worked in a ship-yard, and taught himself to read and write. At the age of 21, he escaped to New York, and thence to New Bedford, in Massachusetts, where he married a woman of color, and worked until 1841, when he attended an anti-slavery convention at Nantucket, and spoke so eloquently on the subject of slavery, that he was employed as an agent of the Massachusetts anti-slavery society, and lectured for four years with great success. In 1845, he published his autobiography, and accepted an invitation to make a lecturing tour in Great Britain, where, in 1846, a contribution of £150 was made to buy his freedom. Returning to America, he established, in 1847, *Frederick Douglass's Paper*, a weekly abolition newspaper, at Rochester, N. Y. In 1855, he re-wrote his autobiography, republished, 1882, as *Life and Times of F. D.* In 1871, he was secretary to the Santo Domingo commission; in 1872 was a presidential elector for the state of New York; in 1876-81 was U. S. marshal for the District of Columbia; in 1881-86 was recorder of deeds in the District; and in 1889-91 was minister to Hayti. Mr. D. was a fluent speaker, and a ready debater. He d. in 1895.

DOUR, a t. of Belgium, in the province of Hainault, 9 m. w.s.w. of Mons. It is well built and prosperous. Coal and iron mines are worked in the vicinity; there are also many quarries, and to some extent, weaving, bleaching, and leather-dressing are carried on. Pop. '90, 10,603.

DOURO (Span. *Dueño*, Port. *Douro*), the name of one of the largest rivers of Spain and Portugal, rises in the province of Old Castile, about 30 m. w.n.w. of the town of Soria. From its source it flows s.e. to Soria, then winds towards the w., and pursues a general westward direction till it reaches the Portuguese border; it then flows s.w., forming for about 60 m. the boundary between Spain and Portugal; then crossing Portugal and flowing w., it falls into the Atlantic below Oporto. Its Portuguese tributaries are comparatively small. The total length of the river is about 485 miles. The D. is a noble river, and flows through some of the most imposing rock-scenery in the world, as at Barca d'Alva; but is rapid, and of difficult navigation, on account of rocks, sand-banks, etc. It passes through a large portion of the wine-country of Portugal, and conveys the produce to Oporto for exportation in flat-bottomed boats.

DOUROCOULI, a small monkey of Brazil, sleeping by day but active and fierce at night in pursuit of birds and insects. The body is only about 9 in. long, the tail 14; fur soft and grayish white, with a brown stripe down the back. The douroucouli looks more like a cat than a monkey, and sits up like a dog. It has a harsh disagreeable voice. See illus., *MONKEYS, ETC.*, vol. X.

DOUSA, JANUS, (JAN VAN DER DOES), 1545-1604; a Dutch statesman, historian, poet, and philologist, the defender of Leyden. He studied at Douay, Paris, and in other cities, and became friendly with many eminent scholars. In 1572, he was sent as ambassador to England, and in 1574, was charged with the government and defense of Leyden, then besieged by the Spaniards. When the university of Leyden was founded he was appointed first curator. In 1585, he was sent to England to solicit assistance from queen Elizabeth. In 1591, he was a member of the states-general. His principal work was the *Annals of Holland*.

DOVE (probably from the same root as *dive*, owing to its habit of ducking the head; compare Lat. *columba* with Gr. *kolumban*, to dive), a name sometimes extended, as the name pigeon also is, to the whole family of *columbida*, sometimes like it restricted—at least when used without prefix—to the genus *columba* of the more recent ornithological systems. No distinction between the terms dove and pigeon is sanctioned either by constant scientific or general popular use. Audubon attempts to make a distinction, giving the name pigeon to those species of which many nests are built close together on the same trees, and dove to those which are solitary in their nidification; but this distinction is quite unsuitable to the European species, and contrary to British usage. See **PIGEON**.

DOVE. In Christian art, the dove is employed as an emblem of the Holy Ghost, no doubt from the fact of this being the form in which the Spirit descended on our Lord at his baptism. From the dove being also used to symbolize purity, it is generally represented white, with its beak and claws red, as they occur in nature. In the older pictures, a golden nimbus surrounds its head; the nimbus being frequently divided by a cross, either red or black. In stained glass windows we see the dove with seven rays proceeding from it, terminating in seven stars, significative of the seven gifts of the Holy Spirit. Holding an olive branch, the dove is an emblem of peace. When seen issuing from the lips of dying saints and martyrs, it represents the human soul purified by suffering. A dove with six wings is a type of the church of Christ; and when so employed, it has the breast and belly of silver, and the back of gold, two wings being attached to the head, two to the shoulders, and two to the feet. The *pyx* or box for containing the host (q.v.) in Catholic churches, is sometimes made in the form of a dove, and suspended over the altar; and the dove is often placed on the covers of fonts. In this position it may still be seen in parish churches in England.

DOVE, HEINRICH WILHELM, one of the ablest recent physicists of the continent, was b. in 1803, at Liegnitz, in Silesia, where his father was a merchant. He studied at Breslau and at Berlin, at the latter of which he took the degree of doctor in 1826. He was successively "privatdocent" and assistant professor of natural philosophy in Königsberg. Having been transferred to a similar post in Berlin, he subsequently became full pro-

fessor, and was elected to a seat in the royal academy of sciences. His writings, which are very numerous, are to be found in the memoirs of that academy, and in Poggen-dorff's *Annalen*, besides several published separately. The most celebrated of these refer to meteorology, climatology, induced electricity, and circularly polarized light. We may mention among his works *Ueber Mass und Messen* (2d edition, Berlin, 1835), a treatise on the art of measuring, and the origin and comparison of the metrical standards of different nations; *Meteorologische Untersuchungen* (Berlin, 1837), a remarkable treatise, *Ueber die nicht periodischen Aenderungen der Temperaturvertheilung auf der Oberfläche der Erde* (4 vols., Berlin, 1840-47); *Untersuchungen in Gebiete der Inductionselectricität* (Berlin, 1843). In conjunction with other distinguished German philosophers, D. commenced, in 1837, the publication of an extensive series of treatises on different branches of natural philosophy. This work, called *Repertorium der Physik*, remains unfinished. In his capacity of director of all the Prussian observatories, he published annually an account of their labors. To him is due, amongst a great variety of optical discoveries, the application of the stereoscope to the detection of forged bank-notes—an ingenious and useful idea. To English readers, D. is best known by his treatise on the *Distribution of Heat on the Surface of the Globe*, which was published in 1853, by the British association. In this work he enters fully into the causes of periodic variations of temperature at different parts of the globe, and lays down in admirable charts the monthly and annual isothermal and isabnormal lines—thus tracing the variations in form and position of the different isothermals throughout the year. *Das Gesetz der Stürme* (4th ed., 1874) has also been translated (The Law of Storms). Other works are *Ueber Electricität* (1848); *Optische Studien* (1859); *Eiszeit, Föhn, u. Sirocco* (1867); *Klimatologie von Norddeutschland* (1871). D. died 4th April, 1879.

DOVE, RICHARD WILHELM, b. Berlin, in 1833; 1862, professor in the university of Tübingen; in 1865 at Kiel, and in 1868 at Göttingen. In 1873 he was nominated a member of the Prussian court of ecclesiastical affairs. In 1860 he established and began to edit the well-known periodical, *Zeitschrift für Kirchenrecht*, a leading European publication on ecclesiastical law.

DOVECOT. The right of erecting or keeping dovecots was in England formerly a privilege of manors, and was rigorously protected by law; but such exceptional privileges have long been abolished. The Scottish statute, 1617, c. 19, enacts that no person shall build a dovecot or pigeon-house, either in town or country, unless he be possessed of lands or teinds of the yearly value of ten chalders of victual, lying within at least two miles of it. Among the old noblesse of France the keeping of pigeons was an exclusive privilege, and large pigeon-cots are a marked feature of their chateaux.

DOVER, city, capital of Delaware, and co. seat of Kent co., on St. Jones river, 45 miles south of Wilmington and five miles west of Delaware Bay. The Delaware Division of the Phila., Wilmington & Baltimore railroad passes through it. Dover is regularly built on high ground. The public buildings are the state house, county building and court house, which stand in a beautiful square planted with elms, and a post-office building in the business centre. There are churches, Wilmington Conference Academy, banks, weekly newspapers, hotels, separate graded schools for white and colored children; also a large agricultural and manual training school for colored students, in the suburbs. The manufactories include canning factories, a foundry, and machine shops, a saw-mill, a basket and crate factory, planing-mills, and silk braid factory. Dover has a handsome monument erected in memory of Cæsar Rodney, one of the signers of the Declaration of Independence. Pop. '90, 3061.

DOVER, a city and co. seat of Strafford co., N. H., lies on both sides of the Cocheco river, two miles from its junction with the Piscataqua; 10 miles n.w. of Portsmouth, and 40 miles e. of Concord. The Cocheco has a depth of eleven feet at high tide, and here forms a good harbor. The city is at the head of navigation and is entered by branches of the Boston and Maine railroad. It is the oldest town in the state, having been settled in 1623, and in 1689 was attacked by the Indians, who killed twenty-three persons and carried twenty-nine into captivity. A city charter was granted in 1855. Dover is situated on hilly ground, is regularly laid out, contains many handsome private dwellings and a number of public buildings worthy of special mention, such as the city hall and the high school. There are several churches, a court-house, a public library, Franklin academy, public schools, national and savings banks, and daily and weekly newspapers. The chief industry is the manufacture of prints, cotton and woolen goods, machinery, foundry products, and shoes. The Cocheco river furnishes the chief water power, having several falls, one of which is 32½ feet high. An immense reservoir, Bow pond, fifteen miles from the city, is used as a supplemental source of supply during the dry season. Additional water power is furnished by Black river, in the south part of the city. Population '60, 8502; '80, 11,693; '90, 12,791.

DOVER, a city in Morris co., N. J., on the Rockaway river, the Morris and Essex canal, and the Delaware, Lackawanna and Western, and the New Jersey Central railroads, 28 miles w. of Newark. It has large iron interests, railroad car shops, hosiery mill, machine shops, silk mill, stove, furnace, and range works, electric lights, national bank, high school, business college, and daily and weekly newspapers. Five miles from the city the Federal government has established its principal powder depot. Pop. '90, not separately reported; '95, state census, 5,021.

DOVER, a parliamentary and municipal borough in the e. of Kent, 66 m. e.s.e. of London, and the head-quarters of the south-eastern district of the British army, is not only a charmingly situated watering-place, but, being the nearest point of the English coast to France, is a seaport of rapidly growing importance. The Admiralty Pier begun in 1848, was designed to form the western arm of the harbor. In 1891 a parliamentary bill for the carrying out of very extensive works in the harbor received the royal assent. The Admiralty Pier was to be extended and a new work, the East Pier, was to be built. The plan comprises also the construction of an iron viaduct 1260 feet in length, the surface being 19 feet above high water. The works, when completed, will form a sheltered area in the harbor of 36 acres, with a depth of from 3 to 6 fathoms, in low water. The memorial stone was laid by the Prince of Wales on July 20th, 1893. The reclamation of a large section of land, and the construction thereon of two railway jetties, also form a part of the plan. The first submarine block in the foundation of the East Pier was laid in 1894, and during the years 1895 and 1896 the work of construction made great progress. The fortifications comprise Dover castle, which occupies a commanding position on the chalk cliffs, 375 ft. above the level of the sea, and in the construction of which Saxons and Normans displayed no small amount of ingenuity; the western heights, fort Burgoyne, the south front, the drop redoubt, the citadel, the western outworks, and the north center bastion. No special trade is attached to the town, which transacts a miscellaneous maritime business with the French and Belgian ports, and offers excellent harbor accommodation for every variety of shipping. Pop. of borough, which returns two members to parliament (1891), 33,418. D. is well sheltered by the cliffs, and ends landward in a charming valley leading to what is known as "The Garden of Kent." In Roman days it was known as Dubris; the Normans called it *Dovere*; the French, *Douvres*; whilst in legal documents of this day the town is *Dovar*, all four terms being variations of the word "Dour," the name of the small river which runs through the town. Fortified and walled by William the Conqueror, during whose reign it was nearly burned down, noted as the place of king John's submission to the pope, besieged by the French, held during the civil war by the parliamentarians, threatened by the first Napoleon, and celebrated as the headquarters of the lord wardens of the cinque ports, D. holds a distinguished place in English history. Three submarine cables connect it with the continent, and plans for a tunnel have often been discussed. If carried out, they would bring France within half an hour's journey from Dover.

DOVER, STRAIT OF (*Frethum Gallicum, Pas de Calais*), the sea-channel between England and France, connecting the English channel and North sea, whose tides meet here. It is 18 to 25 m. broad, and 6 to 29 fathoms deep, but at Warne and Ridge Shoals only $1\frac{1}{2}$ to 4 fathoms. The English coast consists of chalk cliffs 300 to 600 ft. high, succeeded on the s. by lower greensand, and the French, from Calais to Cape Grisnez, is of similar strata. Britain and the continent seem to have been once united here by an isthmus. In Aug., 1875, Capt. Webb, an English naval officer, accomplished the wonderful feat of swimming the S. of D. in $21\frac{1}{2}$ hours.

DOVERON, or *DE'VERON*, a river of the n.e. of Scotland, rising in the w. of Aberdeenshire, a little s. of the Buck of the Cabrach (2377 ft. high). It runs 55 m. n.e., or 36 in a straight line, through adjacent parts of the counties of Aberdeen and Banff, and partly dividing them, past Huntly to the North sea at Banff. It drains a basin of 410 sq. m. composed of syenitic greenstone, metamorphic rocks, and old red sandstone.

DOVER'S POWDER is a preparation of powder of ipecacuanha 1 dram, opium in powder 1 dram, and sulphate of potash 1 ounce. The whole is thoroughly mixed, and the ordinary dose is from 5 to 10 grains. Occasionally, saltpeter is added. It is a most valuable medicine, and acts as a sudorific, increasing the proportion of sweat or sensible perspiration. In feverish conditions, where there is the dry furred tongue, and the dry skin, and the brain out of order, D. P. is reckoned to prove injurious; but where the tongue is moist, the skin moist and soft, and the brain comparatively unaffected, D. P. is of great service.

DOW, LORENZO, 1777-1834; born Conn.; an American preacher of limited education, noted for his eccentricities as well as zeal. In youth he was in much perplexity about religion, but finally joined the Methodists, and for a short time was a preacher in that denomination, which he left under a conviction that he was called to be a missionary to the Roman Catholics of Ireland. His preaching in that country attracted crowds of people, and brought him some persecution. He also visited England, introducing there the system of camp-meetings, which is still popular among the Methodists. After returning to the United States for a time, he repeated his visits to Ireland and England in 1805. He afterwards preached for many years in the United States, traveling all over the country, and sometimes making appointments a year in advance, which he filled at the exact day and hour. His natural eloquence and his eccentricities of dress and speech attracted large audiences everywhere. He preached much against the Jesuits, whom he regarded as conspirators against civil and religious liberty. His *Polemical Works* appeared in 1814. Among his other writings are *The Stranger in Charleston, or the Trial and Confession of Lorenzo Dow*; *A Short Account of a Long Travel*; and the *History of a Cosmopolite*—the cosmopolite being himself.

DOW, NEAL, a temperance reformer, born Me., 1804. He is the author of what is known as the "Maine Law," prohibiting the sale of intoxicating drinks in that state

under severe penalties, in operation since 1851. He was a brig.-gen. of volunteers in the war for the preservation of the Union, was taken prisoner near Port Hudson in 1863, and was Prohibition candidate for president in 1880. His 90th birthday (March 20, 1894) was observed by the Women's Christian Temperance Union throughout the world.

DOW'AGER (Fr. *douairière*, from *douaire*, dowry, dower, derived from the Greek and Lat. *dos*, a thing given, verb *do*, to give), a widow with a dower (q. v.); but commonly the title is applied only to the widows of persons of high rank. The queen-dowager, as the widow of the king, enjoys most of the privileges which belonged to her as queen-consort. But it is not high treason to conspire her death, because the succession to the crown is not thereby endangered. Still no man can marry a queen-dowager without special license from the king.

DOWDEN, EDWARD, English author, b. in Cork, Ireland, in 1843, was educated at Trinity college, Dublin, where he subsequently held the professorship of English literature. He wrote a *Primer of Shakespeare*, 1872, the success of which prompted him to another work on the same subject, *Shakespeare, His Mind and Art*, 1880, and in 1893 he published an *Introduction to Shakespeare*. His Shakespearian works have had a wide circulation and been employed as text books in college classes. They show a keen critical faculty and a genuine admiration of the great dramatist, though perhaps the classification of the latter's writings, according to the supposed psychological periods of his life, may appear somewhat fanciful. His other works are *Poems* 1876; *Studies in Literature*, 1873; *Southey* (in *The English Men of Letters*), 1879; *Life of Percy Bysshe Shelley*, 1886; *Transcripts and Studies*, 1888, and the *French Revolution in English Literature*, in 1897. The last named work is a collection of essays on the English authors at the close of the 18th and early part of the 19th century, which were delivered in the form of lectures on the occasion of the Princeton sesqui-centennial and published in the series called *Princeton Lectures*.

DOW, DOU, or DOWW, GERARD, one of the most exquisite of all the Dutch *genre*-painters, was b. at Leyden in 1613. He received his first instructions in drawing from one Dolendo, a draughtsman, and at the age of 15 entered the school of Rembrandt. That marvelous genius for color which the latter possessed, fascinated the young painter, who soon showed a similar mastery over *chiar-oscuro*, but at the same time developed artistic qualities of a wholly different kind from those of his master. The most insignificant incidents of daily life were precious to D., and were delineated with a delicacy, neatness, and care, that could not be surpassed. In his workshop, the utmost cleanliness prevailed. D. was true to nature in a degree positively wonderful. The richness, transparency, vigor, and harmony of his coloring are beyond all praise. In consequence, his pictures, though generally small in size, are considered gems of art, and have brought astonishing prices. One of his best works, "The Dropsical Woman," is valued at 30,000 guilders. Among his other pieces may be mentioned "The Village Grocer," "The Dutch Cook," "The Mountebank," "The Fiddler," "The Dentist," and "The Interior of a Household." His works, which are pretty numerous, are in all the great European collections. D. died at Leyden in 1680.

DOWEL (Fr. *douille*, socket), is a small wedge or piece of wood driven into the joints of brickwork, or into any wall, to which other pieces of wood may be fastened by nails; also, a vertical iron rod fixed into a wall and also into a body that is to be attached securely thereto.

DOWER. At common law, the one third interest of a wife in the real estates of inheritance of which her husband was seized during the coverture in such a way that the children of the two might have inherited it. This interest in her husband's real estate continues during her life, and may pass through three stages or forms. During the coverture and ownership of the property by the husband, she has an *inchoate* right of dower. This is a mere right or possibility of obtaining property by surviving her husband. It is a right, however, which the courts will protect, as between her and her husband. After the death of the husband, and before she has been put into possession of the specific one third of his realty which should be set apart for her, she has a right of action for the purpose of obtaining her dower lands. It is the duty of the husband's heirs, or purchasers, or other persons who may be in possession of the property, to set out or *assign* her one third to her, and her action lies to compel the performance of that duty. After such assignment has been made, and she has been given possession of the land, she acquires an interest or estate therein during her own life. In connection with her dower right she is also entitled to a residence in the chief house or home of her husband, for forty days after his death, provided she remain unmarried and chaste during that time, and in the meantime to have her reasonable sustenance out of his estate. This right is known as the widow's quarantine. Dower attaches to real property only, and not to personal chattels. It is strongly favored by the common law. No act that the husband alone can do will bar it. If he sell real estate to which his wife's dower right attached without having her unite in the transfer, the purchaser takes subject to such right. It is not necessary that the husband shall be actually in possession of the property in order to give the wife dower therein. The fact that he is seized, during the coverture, in fact or in law, of a beneficial estate of inheritance, legal or equitable, will be sufficient to support her claim to dower. But in England, and in many of the United States, modern statutes have materially modified the rights of the

wife in the husband's property. Where dower is preserved by such statutes, the husband is usually given power, by his own act or deed alone, to bar it as to property which he desires to sell during the coverture. In many of the older states of this country, however, the common law dower is still retained. In the absence of positive modern statutory changes, there are several ways in which dower may be barred. These are: 1. By an absolute divorce. In the absence of statutory qualifications, such a divorce bars dower whether it was obtained because of the misconduct of the husband or for that of the wife. But in some of the states of this country, if the wife obtain the divorce for the misconduct of the husband, she does not thereby lose her dower right. 2. If the wife join in the deed by which her husband conveys real estate, and indicate therein that she does so for the purpose of releasing her rights in that land, she will be thereby barred of dower. This method, which is now the one most commonly employed, is due to statutes uniformly enacted where dower exists, which declare that such a conveyance shall bar her dower rights. 3. If the wife induce any one to purchase her husband's real property by representing to him that she has no dower rights in such property, she will be estopped or precluded from subsequently claiming dower from that property against such purchaser or those who claim under him. 4. If the title of the husband be defeated, either while he lives or after his death, by one who claims under a paramount title, this will, in general, also defeat the wife's or widow's dower. 5. When, by the exercise of the right of eminent domain, the state takes real estate from the husband and makes compensation to him for it, the wife's right of dower in the property so taken is barred. But she may follow the proceeds or purchase money, and insist that her dower shall attach to that. 6. If, during the period of the statute of limitations (in most jurisdictions twenty years) after her husband's death, a widow fail to assert her claims upon his realty, her dower will be barred. 7. By a jointure, also, the dower of a widow may be defeated. Jointure is a provision for the wife, usually made before the marriage by the prospective husband. If made at that time in conformity to the requirements of the so-called statute of jointures, or if made at that time with the consent of the intended wife, although not in strict conformity to that statute, she may be compelled, after the husband's death, to abstain from claiming her dower, upon receiving the provision thus made for her in its stead. If the settlement thus made upon her conform to the statute of jointures, it is known as a legal jointure, and will be recognized and enforced in the common law events. If it do not conform to that statute, but be made with her consent, it is known as equitable jointure, since it can only be enforced in a court of equity. If the settlement or provision be made after the marriage, whatever may be its form, it is not an absolute bar to dower; but after the husband's death the wife may elect whether she will take her dower out of his real property or accept the provision thus made for her in lieu thereof. She is, in the same manner, compelled to make her election, if the husband give her property by his will and indicate expressly or by necessary implication that he means such gift, if accepted by her, to be received in lieu of dower.

DOWLAS, a kind of coarse strong linen, used by working-people for shirts, and manufactured largely at Knaresborough in Yorkshire, at Dundee, and at Newburgh and other places in Fifeshire. Since the introduction of calico, the home demand for dowlas has very much diminished, the article being little used except in the iron districts. The principal exports of D. are to Spain, and the countries inhabited by peoples of Spanish origin, in North and South America.

DOWLATABAD' (in English, *Abode of Prosperity*), a strongly-fortified t. of Hindustan, within the Nizam's dominions, near their n.w. frontier, in lat. 19° 57' n., and long. 75° 18' east. The town is commanded by a rock-fortress, which, with a height of about 500 ft., is scarped into a perpendicular for the lowest third of the altitude. This stronghold is all the more formidable from its being completely isolated, being fully 3,000 yards distant from any other eminence. The town of D. has greatly decayed, and has only a small population.

DOWLER, BENNET, a physician, b. Va., 1797; educated at the medical school of the university of Maryland; settled in New Orleans in 1836, where he gained high professional standing. He was for some years the editor of the *New Orleans Medical and Surgical Journal*. He is the author of a *Tableau of the Yellow Fever* of 1853, and of various contributions to the periodical literature of the profession. He founded the New Orleans academy of sciences. He performed many experiments upon the human body immediately after death, the results of which are valuable. He d. in 1879.

DOWN, a maritime co. in the s.e. of Ulster province, Ireland. It is 51 m. long, and 38 broad, with an area of 957 sq. m. It has a coast-line of 67 m., or 125 by the inlets, mostly low and rocky, and with many isles off it. The chief inlets are Belfast lough, 3 m. broad, and 15 deep; Strangford lough, $\frac{1}{2}$ to 3 m. by 10; Dundrum and Carlingford bays. The Mourne mountains cover 90 sq. m. in the s., and rise 2,796 ft. in Slieve Donard. The other parts of D. are mostly undulating and hilly, with plains and fine meadows along the rivers. The chief rocks are lower Silurian—covering most of the county—and granite, composing the Mourne and Croob mountains. The chief rivers are the Upper Bann and the Lagan. The Newry canal admits vessels of 50 tons, and with the Ulster canal opens communication through almost all Ulster. Thick marl beds occur in the alluvial tracts. The soils are chiefly stony and clayey loams. The chief crops are oats, potatoes, turnips, wheat, flax, and barley. Many pigs are reared. The chief manufacture is linen, especially the finer fabrics, as muslin, woven in the

houses of the small farmers. Flax and cotton mills have become common. Hosiery, leather, salt, thread, and woollens are also made. These, with corn, butter, pork, and hides, are the chief exports. D. is among the best cultivated of the Irish counties. The chief towns are Downpatrick, Newry, Newtownards, Bannbridge, and Donaghadee. Presbyterianism prevails in the towns and low country, and Roman Catholicism among the mountains, and in the barony of Lecale. D. has many ancient remains, as raths, round towers, castles, and abbeys. On the top of Slieve Croob (1755 ft. high) are 23 stone cairns, one being 54 ft. high. Pop. '81, 269,927; '91, 267,059.

DOWNCAST, the name of a shaft used for ventilating mines. The foul air is made to ascend through a flue by a fire burning at the bottom, while fresh air descends through the downcast.

DOWN EAST is a provincialism used in the other New England states for the state of Maine. A citizen of Maine is also alluded to as a *down-easter*. The origin is uncertain.

DOWNES, JOHN, 1786-1855, b. Mass.; an American naval officer. He entered the navy in 1802, and was in the frigate *New York* as midshipman during the war with Tripoli, distinguishing himself by gallant service. He was made a lieutenant in 1807, and served as such on board the frigate *Essex* against the British, under Capt. Porter, 1812-14, who assigned him to the command of the cruiser *Essex Junior*. In 1815, he commanded the brig *Epervier*, under Decatur, in the war against Algiers, and assisted in taking an Algerine pirate; also in capturing the Algerine brig *Estido*. In 1817, he was made captain, and commanded the frigate *Macedonian* in the Pacific, 1819-21. In 1828-29, he served in the Mediterranean squadron, and 1832-34 he was with the squadron in the Pacific. In 1837, he was appointed commander of the navy-yard in Charlestown, serving till 1842. He filled the same post again, 1850-52.

DOWNHAM MARKET, a small town in the w. of Norfolk co., England, on a hillside, on the right bank of the Ouse, 40 m. w. of Norwich, and 10½ s. of Lynn-Regis. It lies amid fen and dairy land. It has a bell-foundry, and a celebrated butter market. By the Ouse and Cam, vessels proceed from Lynn on the coast to Cambridge, 30 m. above Downham Market. *A market was confirmed here in the time of Edward the Confessor.

DOWNIE, DAVID, missionary, b. in Scotland, 1838, went to the United States in 1852, studied at Phillips Andover Academy, Brown University, and Rochester Theological Seminary. Having been appointed missionary of the American Baptist Missionary Union, in 1873, he went to Nellore, India, where he established a large number of missionary stations, and is said to have raised the number of communicants from 1500 to 80,000. He is the author of *The History of the Telugu Mission* (1893).

DOWNING, ANDREW JACKSON, 1815-52; born N. Y.; a pomologist and landscape gardener. In his chosen department he showed a fine taste, and introduced great and lasting improvements, developing a public appreciation of harmonious landscape decoration. He was drowned in the Hudson river when the steamer *Henry Clay* was burned. His works are *A Treatise on the Theory and Practice of Landscape Gardening*, and *Fruit and Fruit Trees of America*, both highly esteemed. He was for a time editor of the *Horticulturist*, published in Albany. A volume of his *Rural Essays*, with a memoir by George Wm. Curtis, was published after his death. To his suggestion, N. Y. City owes its Central Park.

DOWNING, CHARLES, brother of the preceding, was born July 9th, 1802, at Newburgh, N. Y., and died there Jan. 18th, 1885. He assisted his more famous brother in the compilation of *The Fruits and Fruit Trees of America*, and after the latter's death revised the book for several editions, his contributions to the book swelling it to twice its original size, and his labors making him well known as a pomologist and authority on horticultural and arboricultural matters in all parts of the world.

DOWNING, Sir GEORGE, 1623-84; b. Dublin; a nephew of Gov. John Winthrop. He graduated at Harvard coll., 1642; went to England and took service as chaplain in the Parliamentary army. Cromwell made him Resident at the Hague, where he secretly contrived to ingratiate himself with the exiled Stuarts. After the restoration he was knighted, 1663, and became sec. of the treasury and one of the commissioners of customs, 1667. One of a number of houses that he built in London, in the street which afterward took from him its name, Downing street, having been forfeited to the crown, has ever since the time of sir Robert Walpole been the official residence attached to the office of first lord of the treasury. His grandson founded Downing college.

DOWNING, Sir GEORGE, 1684-1749, the founder of Downing college, Cambridge, was a grandson of Sir George Downing who died in 1684. He sat in parliament from 1710 to 1713, was re-elected in 1722, and remained a member till his death.

DOWNING COLLEGE, CAMBRIDGE, founded solely by sir George Downing, of Gamlingay park, Cambridge, who, by a will of date 20th Dec., 1717, devised his estates in the counties of Cambridge, Bedford, and Suffolk to various relations in succession, and on failure thereof, to build and found a college on a plan to be approved of by the two archbishops of England and the masters of St. John's and Clare colleges. Owing to various litigations and other difficulties, it was not till 22d Sept., 1800, that the college received its charter, sealed with the great seal, nor till May, 1821, that the buildings were sufficiently advanced to admit of undergraduates residing and keeping terms.

DOWNING STREET is a short street in Whitehall, London, named from sir George Downing (secretary of the treasury in 1667), in which are located the colonial and foreign offices; also, since 1735, the official residence of the first lord of the treasury. Here cabinet councils are held, hence the term is sometimes employed to denote the government in office.

DOWNPATRICK (mount of Patrick), or Down, a municipal borough and cathedral town, in the s. of Down, of which it is the capital. It is situated near the mouth of the Quoyle, which flows into the s.w. end of lough Strangford, 74 m. n.e. of Dublin, and 21 m. s.e. of Belfast, with which town it is connected by railway. The cathedral was restored in 1790 on the site of one built in 1412, and burned in 1538 by lord deputy Grey. A handsome Catholic church was erected here in 1872. Vessels of 100 tons reach the quay a mile from Downpatrick. It has manufactures of linen, soap, leather, and malt liquors. Pop. '71, 3,621; '91, less than 3,500. Till 1885 it was a parliamentary borough and returned one member to parliament. To the n.w. of D. are the remains of great earthworks, $\frac{3}{4}$ m. in circuit, inclosing a conical rath 60 ft. high and 2,100 in circumference. D. was famous before the arrival of St. Patrick, who founded religious establishments here. D. was burned by Edward Bruce in 1315, and plundered by O'Neil in 1552. The holy wells of St. Patrick at Struel, $1\frac{1}{2}$ m. e. of D., were formerly resorted to by Roman Catholic pilgrims from all Ireland, but for the last fifty years the pilgrimage has ceased.

DOWN'S, THE, an important roadstead or shelter for shipping, off the s.e. coast of Kent, opposite Ramsgate and Deal, between North and South Foreland, and protected externally by the Goodwin sands—a natural breakwater with one to four fathoms water, and often partly dry at low tide. This large natural harbor of refuge is eight miles by six, with an anchorage of four to twelve fathoms, but having many sands and overfalls partly or wholly dry at low water. It is resorted to temporarily by outward and homeward bound vessels, and squadrons of ships of war, and is unsafe only in south winds.—It is defended by Deal, Dover, and Sandown castles.

DOWN'S (Ger. *dünen*, Fr. *dunes*, from the root *dun* (q.v.), common to the Gothic and Celtic languages, signifying a hill), a term usually applied to hillocks of sand thrown up by the sea or the wind along the sea-coast. It is also a general name for any undulating tract of upland too light for cultivation, and covered with short grass. It is specially applied to two broad ridges of undulating hills s. of the Thames, beginning in the middle of Hampshire, and running eastward, the one (the north D.) through the middle of Surrey and Kent to Dover (about 120 m.), and the other (the south D.) through the s.e. of Hampshire and near the Sussex coast to Beachy head (about 80 miles). Between the two ranges lies the valley of the Weald, from which the chalk strata are supposed to have been removed by denudation. Towards the Weald, the descent from both D. is rapid, and presents cliffs as of a sea-margin; while the opposite slopes are gradual. The highest point of the north D. is Botley hill, 880 ft.; and of the south D., Ditchelling beacon, 858 feet. These uplands are covered with fine short pasture, which, from its aromatic quality, forms excellent feeding-ground for the famous South Down sheep. The valleys occurring among the hills are usually fertile, and admit of cultivation, so that an excellent field is furnished for mixed husbandry. By pasturing the sheep on the D. during the day, and folding them on the arable fields at night, the latter are highly fertilized.

DOWN'TON, a small town in the s.e. of Wiltshire, on the right bank of the Avon, here split into three branches, 6 m. s.e. of Salisbury. It chiefly consists of one long street with the houses irregularly placed. It has paper-works, and an ancient cross. D., in the middle ages, had a castle, of which the mound or moat remains, and is a singular earthwork, on which Saxon justice was dispensed. Two miles n. of D. is the mansion and estate of Standlinch, the national gift to the heirs of lord Nelson, for which parliament voted £100,000.

DOXOLOGY, a Greek word, signifies an exclamation or prayer in honor of the majesty of God, such as Paul uses at the close of his epistles, and sometimes even in the middle of an argument (Romans ix. 5). The hymn of the angels (Luke ii. 14) is also called a D. by the Christian church; so likewise is the close of the "Lord's Prayer." The so-called "Great Doxology" is simply an expansion of the angelic hymn, and is sung in the Roman Catholic church at the celebration of the Lord's Supper, and at matins. It commences with the words, *Gloria in excelsis Deo* ("Glory to God in the highest"). The ordinary D., "Glory be to the Father, Son, and Holy Ghost, as it was," etc., is repeated at the end of each psalm in the service of the church of England; there is a similar D. in verse to suit different meters.

DOYLE, RICHARD, son of the celebrated caricaturist H. B., whose name was John Doyle, was b. in London in 1826. He became a contributor to *Punch*, and furnished its pages with the well-known sketches of "Ye Manners and Customs of ye English." In 1850, his connection with that publication ceased, and after that period Doyle employed himself in the illustration of books. Among his works of this nature may be mentioned the *Adventures of Brown, Jones, and Robinson*, and the illustrations to the *Newcomes* and the *Seouring of the White Horse*. He contributed "Sketches of Modern Society" to the *Cornhill Magazine*, and published a Christmas book for 1869, called *In Fairy Land*. His caricatures are all distinguished by the most genial humor, and the most graceful drawing. He d. 1883.

DOZEN, BAKER'S. See **BAKER'S DOZEN**.

DOZY, REINHART, one of the most learned orientalists of the present day, was b. 21st Feb., 1820, at Leyden. He belongs to a family of French origin, which settled in Holland after the revocation of the edict of Nantes. He studied at the university of his

native town, and devoted himself especially to oriental studies. In 1850, he was appointed extraordinary, and, in 1857, ordinary professor of history at Leyden. Besides his writings in the *Journal Asiatique* and other periodicals, D. has published *Dictionnaire détaillé des Noms des Vêtements chez les Arabes* (Amst. 1845); *Historia Abbadidarum* (Leyden, 1846-52); and editions of Abdo'l Wâhid al Marrékoshi's *History of the Almohades* (1847); of Ibn-Badrun's *Historical Commentary on the Poem of Ibn-Abdun* (1848), with introduction, notes, glossary, and index, and of Ibn-Adhari's *History of Africa and Spain* (1848-52). In 1849, appeared his masterly performance, *Recherches sur l'Histoire politique et littéraire de l'Espagne pendant le Moyen Age*. A second edition, enlarged and completely recast, was published in 1860. In this work, D. has exposed the gross and willful corruptions of the monkish chroniclers, who persisted in falsifying history for the benefit of Christianity, and who could form no more rational idea of the Moors than that they were "devils," or abetted by the devil, and sent to torment the Spaniards because of their sins. Other valuable productions of D. are his *Al-Makkari, Analectes sur l'Histoire et la littérature des Arabes d'Espagne* (Leyd. 1855-61); *Histoire des Musulmans d'Espagne jusqu'à la Conquête de l'Andalousie par les Almoravides* (Leyd. 1861); *Het Islamisme* (Harl. 1863); and *Die Israeliten zu Mekka* (1864). He d. 1883.

DRACÆNA DRACO, or DRAGON TREE, of the order *liliaceæ*, producing the resin called dragon's blood. Its thickness is greatly out of proportion to its height. The head is crowned with short branches bearing tufts of sword-shaped leaves. Humboldt saw a tree in Teneriffe which for 400 years had measured 45 ft. in circumference. The Guanches worshiped it, and had hollowed its trunk into a small sanctuary.

DRACHENFELS ("Dragon's Rock"), a mountain on the Rhine, is situated on the right bank of the river, about 8 m. s.e. of Bonn, and has an elevation of 1056 feet. It is of volcanic origin, consisting of lava, trachyte, and basalt. D. rises abruptly from the river, and is covered with brushwood almost to the top, whence the prospect is magnificent, extending down the river as far as Cologne, and having a charming foreground in Bonn, with its university, and numerous villages and time-worn castles. The cave where the dragon—from which the mountain takes its name—was wont to abide is pointed out to the traveler. The ruins of an old castle crown the summit, and add picturesqueness to the Drachenfels. It is one of the range called the Siebengebirge.

DRACHMA, **DRACHM**, **DRAM**. The D. was a silver coin, the unit of the money-system in ancient Greece. It varied in value in different parts of Greece and at different times. The Attic D. is estimated as equivalent to 18 cts. of our money—very nearly a French franc. The Æginetan D. was considerably more. But whatever its absolute worth, it always remained the 6,000th part of the *talent* (about \$1080), and the 100th part of the *mina* (about \$20), and was divided into six obols. There were also coins of two, three, and four drachmas. The D. (originally *a handful*) was also the name of a weight, and 100 drachmas made a *mina*, in weight, as in money. The weight of the D. is stated at from $\frac{1}{4}$ oz. avoirdupois to little more than half as much. At this lowest estimate, the *mina* = 1 lb. nearly. The unit in the monetary system of modern Greece, since 1833, has also been called *drachma*; it is equivalent to $\frac{5}{100}$ of a franc, or about 8 $\frac{1}{2}$ d. sterling, and is divided into 100 lepta. In the British system of weights there were, till recently, two drachms or drams: the avoirdupois *dram*—equal to 27 $\frac{1}{2}$ troy grains—and the apothecaries' *dram* (not now used), equal to 60 troy grains, or $\frac{1}{8}$ of an ounce troy. It is this last which is the representative of the ancient drachma.

DRACHMANN, HOLGER HENRIK HERHOLDT, a popular Danish author, was b. in Copenhagen, Oct. 9, 1846. At 20, he began to study art, but in 1872 began his poetical career with a volume of poems, since which time he has published many poems and prose stories, including *En Overkomplet* (1876) and *On a Sailor's Word* (1878).

DRACO, a constellation in the northern hemisphere. The star γ Draconis is celebrated as the one used in determining the co-efficient of aberration of the fixed stars. It is a bright star, nearly in the solstitial colure, and consequently the minor axis of the small ellipse which its apparent place describes in the heavens, lies in the meridian at its transit. Moreover, at the two equinoxes, when its apparent place is at the extremities respectively of this minor axis, it can be observed on the meridian at one equinox about sunrise, and at the other about sunset, so that both observations may be made without the interference of a too bright daylight. These two observations, therefore, are easily taken, and the difference in the north polar distance which they give, is the minor axis of the ellipse described by the apparent place of the star.

DRACO (Gr. *Drakon*), an Athenian lawgiver and archon, who, in the year 624 B.C., was appointed to draw up new laws for the disordered state. These, however, effected little change in the form of the state; but by being committed to writing, put an end to the arbitrary administration of justice on the part of the archons, and resulted in the establishment of a court of appeal—that of the *Éphetaë*. D.'s legislation had a beneficial and permanent effect upon the political development of Athens. The extraordinary severity of these laws, however, which punished the slightest theft, or even laziness, with death, no less than sacrilege, murder, and treason, caused them to be often neglected, and made them so hated, that Solon was appointed to draw out a new code. Solon, though he softened their severity in most instances, retained that law which punished a murderer with death. D., at a later period, went to Ægina, where, after

having introduced his laws, he is said to have been stifled in the theatre by the garments thrown upon him as a mark of respect by the people. The severity of his laws gave rise to a pun by Herodicus, who declared that D.'s laws were those of a dragon (Gr. *drakon*) and not of a man. Hence also originated the metaphorical remark of Demades, "that they were written not in ink but in blood." Extremely severe and sanguinary laws are still called *Draconic*.

DRACONTIUM, a genus of plants of the natural order *araceæ*, of which one species, *D. polyphyllum*, a native of Guiana, Surinam, and also of India and Japan, has a powerful action on the nervous system, and is useful in asthma; although at present its chief reputation is the somewhat doubtful one of curing the bite of a snake, to which its mottled stem gives it some resemblance. The flower, when it first expands, emits an intolerable stench.

DRACUT, a t. in Middlesex co., Mass., on the Merrimack, opposite Lowell, with which it is connected with bridges. Agriculture is the main business, but there are also some manufactures of woollens, paper, etc., and electric railroads. Pop. '90, 1906.

DRAESEKE, FELIX, composer, b. in Cologne, Oct. 7, 1835. He studied under Rietz in Leipzig and Liszt in Weimar, taught in the conservatories of Munich and Lausanne, and finally settled in Dresden. His works include symphonies for orchestra; piano-forte music; quintets, etc.; a *Requiem* for soli, chorus, and orchestra; and an opera, *Gudrun* (Hanover, 1884).

DRAFT, an order addressed to a debtor by his creditor, calling upon him to pay a certain sum either to the drawer or to a third party. See **BILL**, **CHECK**.

DRAFT, or **DRAUGHT**, a tentative copy of a legal document, or other formal writing, made for the purpose of adjusting the matter afterwards to be admitted into the fair copy, or engrossed, as it is called. Manuscripts and proof-sheets are the drafts of printed works.

DRAFT-RIOTS. The greatest riot ever known in American history began in New York city on July 13, 1863. The civil war had continued three years, and as many of the troops were three years' men whose time was about to expire, it became necessary to fill their places. Volunteers were coming in too slowly, and as a last resort, in March, Congress passed a conscription act, authorizing the President to recruit the army whenever necessary by a draft from the able-bodied citizens between the ages of twenty and forty-five. A general enrollment was made and due notice given that the draft would be made whenever the enrollment in each district was completed, and the quota assigned. Further notice was given in New York city that the draft would begin on Monday, July 13, and that in some of the sub-districts that were ready, it would begin on Saturday, the 11th, and, accordingly, it did begin on that morning, in the office located at Third ave. and Forty-sixth st., in the third sub-division of the Ninth Congressional district. The draft, which was made by means of a lottery wheel, continued all day, and at night 1236 names had been drawn, leaving only 264 to be drawn on Monday. The vicinity of the office was crowded the entire day, and though there were many clouded faces, and many utterances of discontent, yet there was nothing that seemed unreasonable. Neither was there any question of unfairness or partiality. All ranks and classes were represented in the list of the drafted, though the vagrant and roaming class had, perhaps, escaped in larger proportion than any other. But a number of these were drafted, too, and these were the desperate men who were ready to lead on the mob on Monday. The draft began again at the Third ave. office on Monday morning, and about nine o'clock the crowd was so dense that the street cars on Second and Third avenues were compelled to stop running. Then, a few ugly-looking men in the crowd cut the telegraph poles and wires near the enrollment office, but they were defeated in this part of their work by the superintendent of the police telegraph system, who happened to be passing in the street. Seeing the wires down, the police special wires among them, he quietly gathered them all up and wound them around a lamp-post. The crowd threatened violence, but he coolly remarked, "Only getting the wires out of your way, boys," and he was permitted to go unmolested. He hastened at once to a station in Thirty-fifth st., and telegraphed the facts to the main office, and this is supposed to be the first trustworthy intimation of the real danger that menaced the city. Extra squads of policemen were at once sent to the various enrollment offices, of whom sixty went to the one on Third ave. Among the names drawn on Saturday was that of the head of Fire Engine Co. No. "Thirty-three." Their engine house was located on Fifty-eighth st., near Broadway, and their engine was known as the "Black Joke." They were an exceedingly rough class of men, though not criminals, by any means, and on Sunday evening had decided that the proper thing for them to do was to go over to Third ave. in the morning and destroy every evidence of the draft that had called their chief. They arrived at the office shortly after the extra policemen. The police were an unexpected sight to them, but they hesitated only a few minutes. Some one, either in the rough crowd previously there or one of the "Black Jokers," fired a pistol shot, and as if it were a signal agreed upon, a rush was made for the office, and the "draft riot" was begun. From that moment the mob seemed let loose. The police fought bravely, giving the officials time to escape at the rear of the building, taking many of their papers and records with them; and then, with

a desperate charge, the police made good their own escape, severely bruised but without loss of life. Soon after this some one in the crowd produced a can of turpentine, and the office was set on fire. The upper floors were used as a tenement house for poor people. These were permitted to escape with their lives, but they were not allowed to save any of their household goods. Neither were the firemen who came when the alarm was sounded allowed to put out the fire, and the whole block with the exception of a part of a building was destroyed. This was the first of twenty-four distinct fires reported in different parts of the city in the course of the next twenty-four hours, all kindled by the rioters. No firearms had been used as yet, and, as if the crowd suddenly thought of them, they wended their way to the armory corner Third ave. and Twenty-fourth st., and after many attempts succeeded in storming the main entrance; and it was but a few minutes' work to rifle the building of its contents, and set it on fire in a dozen different places. Many of the rioters had gone to the drill room, and the partitions, floors, and stairways were soon one vast sheet of flame, cutting them entirely off from all means of escape, and it will never be known how many perished in that terrible furnace. While all this was taking place the mob was rising and acting in every part of the city. The cry of "down with the rich man" was frequently heard, and no well-dressed person was safe on the street. The greed of plunder early manifested itself, and a rapidly increasing mob was rushing up Lexington and other avenues, pillaging the houses and setting them on fire out of sheer envy excited by their elegance. The residence of Mayor Opdyke seemed a particular object of hatred. The mayor himself had taken no precaution, but one of his friends gathered a party of well-armed citizens and took possession of his residence as a garrison. The events proved the wisdom of his course. Several mobs came there, and seeing the rifles in and about the house, concluded to withdraw. One of these mobs, increasing rapidly as it went, started down Broadway for the Wall st. banks. On their way, they proposed also to take the Lafarge House, because of the large number of colored servants employed there. They were armed with iron bars, axes, clubs, pitchforks, and a few muskets and pistols. By the time they reached Amity st., the mob had swelled to a thousand men. Every colored man they met was beaten and stoned as "the cause of the war," and therefore responsible for the Draft act. At Bleecker st. and Broadway they were met by about two hundred policemen, and then came the first regular battle between the mob and police, and the latter won a complete victory. About this same hour, another detachment of the mob was performing a most cowardly deed. The Colored Orphan Asylum on Fifth ave. and Fifty-fourth st. was one of the noblest charities of the city. It was a spacious and elegant building, worth \$200,000. When the attack was made there were in it about two hundred children, all small, with the matrons, nurses, etc. This mob numbered about three thousand, and the barred doors on the Fifth ave. side resisted them just long enough to allow the escape of the little ones through the rear entrances. The mob rushed in to their work of pillage, carrying off everything that they could, and breaking all furniture too bulky to be removed. Fires were lighted with this splintered furniture in all parts of the building, and the mob left the burning building to ransack and pillage the private residences in that vicinity, which were nearly all of the better class. The *Tribune* and *Times* offices on Printing House square were also attacked, but a timely arrival of the police made the mob finally retreat after several unsuccessful attempts to destroy the presses and set fire to the buildings. Riots were kept up for three days, extending to Brooklyn, where a new grain elevator, worth \$100,000, was burned; also to Harlem, where the bridge over McComb's Dam, Washington Hotel and many other buildings were burned. The railroads were among the things early attacked, in order to impede the movements of militia sent to enforce order. But many private citizens had joined with the militia already in the city, and soldiers were summoned from the military posts in the immediate vicinity of the city, so that plunder and destruction received some check towards the middle of the week. There was, however, a greater loss of life, though chiefly among the rioters. As the plundering was checked, the rioters contented themselves with attacking negroes wherever they could find them, and in a number of instances, murdering them. But, on Thursday and Friday, several regiments arrived from the seat of war, and the riot was soon a thing of the past.

There were also riots in Troy and Jamaica, N. Y., and in Jersey City and Boston, with considerable disturbance in many other places, but they were all plainly sympathetic with the New York riot, and quickly subsided when that was put down.

DRAG, a mechanism for slackening the speed of carriages, by operating on one or more of the wheels. The form of D. best known to old travelers by coach is that of the "shoe," a hollow piece of iron attached by a chain to the carriage, which being put below one of the hind wheels, partially reduced the vehicle to the quality of a sledge: by which dragging process the carriage was suitably retarded on going down-hill. As the shoe-drag required to be applied and removed with some inconvenient detention of the vehicle, a step was made in advance when a method of retarding a wheel without detention was discovered. This new process, which is known as the patent drag, consists of a connected piece of mechanism, altogether operated upon by the driver without moving from his seat. A handle affects a series of rods and levers by which a species

of shoe is pressed against one of the wheels, so as to slacken its motion. Such is the kind of drag now very generally attached to gentlemen's traveling-carriages, omnibuses, and other vehicles for passengers on the roads of Great Britain. It is of French origin. Applied in either form, the use of the drag, independently of its safety, is to allow horses to continue running at ordinary speed down-hill without being unduly pressed on by the carriage behind them. A similar contrivance, but of a more powerful kind, called a *break* or *brake*, is applied to arrest the motion of railway-trains. See RAILWAYS.

DRAG. See COACH.

DRAG-HUNT. In parts of the country where foxes are not plentiful, a substitute is found for hunting purposes in the shape of an anise-seed bag, the scent of which is so similar to that of a fox as to deceive a pack of hounds. Previous to the "hunt" the anise-seed bag is drawn over a long and difficult course, and over this the hounds and huntsmen follow an imaginary fox. The anise-seed bag is technically known as the "drag" and the hunt as a "drag-hunt."

DRAGOMAN, from the Turkish *trukéman*, the general name given in Turkey to an interpreter, or to a guide to foreigners. The common dragoman corresponds exactly to the Italian *cicerone*, or the French *commissionnaire* or *valet de place*. There are several connected with the hotels at Constantinople and other Turkish cities, who pounce eagerly upon European travelers, to perform every imaginable service. The diplomatic dragomen are, however, important personages, being the medium of communication between the Christian ambassadors and the sublime porte. Though usually natives, they and their families enjoy the privilege of being under the protection of the embassy they serve, and are subject to the laws of the country of that embassy, and not to the Turkish law. This privilege, which is also enjoyed by all the subjects of the great Christian powers resident in Constantinople, etc., is much valued, on account of the greater severity of the Turkish laws, and the summary manner in which they are executed. These dragomen are mostly of Italian extraction.

DRAGON, a name applied in modern natural history, both popularly and by scientific authors, to different kinds of saurian reptiles. Some of these (the genus *draco* of Linnaeus) are remarkably characterized by false ribs extending from the sides, so as to support a membrane which is used as a parachute. These are called flying dragons (q.v.), or flying lizards. Another reptile which has received the name D., and is also called D. *LIZARD adu*, belongs to a family of saurians, *teyidae*, found only in America, closely allied to the *varanidae* of the old world, and to which, in common with them, the names MONITOR and SAFEGUARD have sometimes been given, in consequence of their being supposed—although erroneously—to give warning by a hiss of the proximity of a crocodile or alligator. It inhabits the marshy plains of Guiana, climbs trees with facility, bites severely, has a long compressed tail, the back and tail crested, the tongue forked like that of a serpent, and attains a length of about 6 feet. Both its flesh and eggs are used as articles of food.

DRAGON. In the mythical history and legendary poetry of almost every nation, the D. appears as the emblem of the destructive and anarchic principle, as it manifests itself in the earlier stages of society—viz., as misdirected physical power and untamable animal passion. Like the serpent, the D. is always a minister of evil, of the principle which aims at negation, opposition, and contradiction, the object of which is to fight against order, harmony, and progress. But whilst the serpent seeks the attainment of its object by cunning and deceitful artifices—crawling on its belly, and always assuming ostensibly characteristics the very opposite of its own—the D. proceeds openly to work, running on its feet, with expanded wings, and head and tail erect, violently and ruthlessly outraging decency and propriety, spouting fire and fury from both mouth and tail, and wasting and devastating the whole land. The destruction of this disorderly element was one of the first objects of human energy, but it was an object which was unattainable by merely human means, and mankind were accordingly indebted for its accomplishment to that intermediate class of beings known as heroes in classical antiquity. As the highest ideal of human strength and courage, the task properly fell to Hercules; but it was not confined to him, for we find both Apollo and Perseus represented as dragon-slayers. From legendary poetry, the D. passed into art, some of the earliest efforts of which probably consisted in depicting it on the shield, or carving it for the crest of a conqueror's helmet. The D. does not seem to have been a native emblem with the Romans, and when they ultimately adopted it as a sort of subordinate symbol, the eagle still holding the first place, it seems to have been in consequence of their intercourse with nations either of Pelagic or Teutonic race. Amongst all the new races which overran Europe at the termination of the classical period, the D. seems to have occupied nearly the same place that it held in the earlier stages of Greek life. In the *Nibelungen Lied*, we find Siegfried killing a D. at Worms; and the contest of Beowulf (q.v.), first with the monster Grendel, and then with the D., forms the principal incident in the curious epic which bears the name of the former. Even Thor himself was a slayer of dragons (J. Grimm, *Deutsche Mythologie*, ii. 653). Among the Teutonic tribes which settled in England, it was from the first depicted on their shields and banners; and Dr. Plott, in his History of Oxfordshire, ascribes the origin of the very ancient custom of carrying the D. in procession at Burford, in great jollity, on midsummer eve, to the fact of a banner adorned with a golden D. having been taken by a king of the West Saxons from a king of Mercia. The custom, however, is said by Brand, on

the authority of Aubanus, to have prevailed in Germany, and was probably common in other parts of England (Brand's *Pop. Antiq.*, i. 321). Nor was the D. peculiar to the Teutonic races. Amongst the Celts, it was the emblem of sovereignty, and as such borne as the sovereign's crest. Mr. Tennyson's *Idylls* have made every one familiar with "the dragon of the great pendragonship," blazing on Arthur's helmet, as he rode forth to his last battle, and "making all the night a stream of fire."

The fiery D., or drake, and the flying D. in the air, were meteoric phenomena, of which we have frequent accounts in old books, and, indeed, as Brand remarks, "the dragon is one of those shapes which fear has created to itself," and which appears in circumstances, and clothes itself in forms, as various as our fears.

In Christian art, the D. is the emblem of sin, the usual form that is given to it being that of a winged crocodile. It is often represented as crushed under the feet of saints and martyrs, and other holy personages. Sometimes its prostrate attitude signifies the triumph of Christianity over paganism, as in pictures of St. George and St. Sylvester; or over heresy and schism, as when it was adopted as the emblem of the knights of the order of the D. in Hungary, which was instituted for the purpose of contending against the adherents of John Huss and Jerome of Prague.

The D. is often employed in heraldry; and other animals, such as the lion, are sometimes represented with the hinder parts resembling dragons. An animal so represented is said to be *dragonné*. See GRIFFIN. A D. without wings is called a lindworm, or lintworm, which Grimm (*Deutsche Mythol.*, ii. 652) explains to mean a beautiful or shining worm.

DRAGON, GREEN, *Dracunculus vulgaris*, a plant of the natural order *araceæ*, which receives its name from its spotted stem. It is a native of the s. of Europe. Its flowers are black, remarkably fetid, and give out exhalations which cause headache, giddiness, and vomiting. The root is emetic, and, probably for no better reason than the peculiar appearance of the stem, has been supposed useful for curing serpent-bites.

DRAGONET, *Callionymus*, a genus of fishes of the goby (q.v.) family (*gobiadæ*), remarkable for having the gill-openings reduced to a small hole on each side of the nape, and the ventral fins placed under the throat, separate, and larger than the pectorals. They have no air-bladder. The species are pretty numerous; most of them finely colored, as the GEMMEOUS D. (*C. lyra*) of the British coasts—called *gowdie* (*gowd*, gold) in Scotland—a fish about 10 or 12 in. long, the prevailing yellow color of which is varied with spots of sapphire blue, etc.

DRAGON-FLY, *Libellula*, a Linnæan genus of neuropterous insects, now constituting the family *libellulidæ*. They are in general very beautiful, rivaling butterflies in their hues, and like them loving the sunshine. They are, however, easily distinguished from butterflies, even at a distance, by their more slender form and comparatively narrow gauze-like wings; and differ from them still more widely in their habits, as they do not feed on the nectar of flowers, but prey on other insects, which they pursue with rapid flight. Dragon-flies have a large head; the mouth is formed for mastication, and its parts, especially the mandibles, possess great strength.—See the article COLEOPTERA for an explanation of the structure of the mouth in *masticating* insects, and the names of its parts.—The antennæ are short, awl-shaped, and of few joints. The eyes are large, lateral, and projecting. The wings—four in number—are equal in size, or nearly so, long, very thin, and very much reticulated. The legs are short. The abdomen in some is compressed, in others slender and cylindrical, in some remarkable for its extreme slenderness. The French name *demoiselle*, given to these insects, seems to be due to their beauty. They are, however, equally remarkable for their voracity. The great dragon-fly (*aeshna grandis*), an insect about 4 in. long, the largest of the British species, has been seen to dart upon a large cabbage-butterfly which passed as it was flitting up and down in search of prey; and then settling on a twig, it bit off the wings, and in less than a minute devoured the body.

Dragon-flies are usually most abundant in the vicinity of lakes, rivers, and marshes. They deposit their eggs in water, and the larvæ and pupæ are entirely aquatic, living chiefly at the bottom of the water, and creeping on the submerged parts of aquatic plants. They are as ravenous as the perfect insect, which in general form they pretty much resemble; aquatic insects are their food. The pupæ, unlike those of the greater number of insects, are active. They are provided with the means of drawing water into their bodies to supply air for respiration, and expel it again by the same orifice at the extremity of the abdomen, with such force, that they thus propel themselves through the water, whilst their legs are at rest. When the final transformation is about to take place, the dragon-fly pupa crawls out of the water on a stick, rush, or other object; fixes itself by hooks, with which its legs are furnished; and the skin then splitting at the back, the perfect insect comes forth, but with body and wings quite soft and moist, and the wings still folded up into small compass. In the sub-family of *agrionidæ*, the wings are elevated vertically in repose: in the true *libellulidæ* (*libellula aeshna*, etc.), they are extended horizontally.

Dragon-flies extend even into very northern regions, but are most abundant in warm climates. See *illus.*, BEETLES, ETC., vol. II.

DRAGONNADES, the name applied to a series of religious persecutions which took place in France in the reign of Louis XIV. and that of his successor, and which were intended to compel the Protestants of that country to renounce their religion. They consisted of armed expeditions, led by a bishop, an intendant, a sub-delegate, or a priest, who marched through the provinces, demanding of the heretics that they should abjure their faith, and leaving such as were refractory to be dealt with by the unscrupulous troops. Foremost among the armed force rode dragoons, who, from the fact of their taking the precedence, and also from the merciless treatment to which they subjected the Protestants, had the unenviable honor of giving a name to the persecutions. Louis XIV., who had been entirely misinformed as to the means employed in the D. by the courtiers and fanatics who surrounded his throne, was delighted to find that from 250 to 400 Protestants were daily being received into the bosom of the church, and in consequence, on the 22d Oct., 1685, a few months after the date of the first of the D., he revoked the edict of Nantes (q. v.), that the good work might be fully accomplished.

DRAGON ROOT, *Arisema atrorubens*, formerly *arum triphyllum*, a plant of the natural order *araceæ*, a native of North America, the tuber of which is a powerful local irritant, and is used as a stimulant of the secretions in chronic bronchitis, asthma, rheumatism, etc. The powder, made into a paste with honey, is beneficially applied to the mouths and throats of children in aphthæ; and milk, in which the root has been boiled, is a useful ointment in cases of scalled head, ringworm, etc.

DRAGON'S BLOOD, sometimes called gum dragon, an astringent, resinous substance, obtained from several trees of different natural orders, natives of warm countries. The greater part of the D. B. of commerce is probably the produce of *pterocarpus draco*, a large South American tree of the natural order *leguminosæ*, suborder *papilionaceæ*, which at some seasons appears as a magnificent mass of yellow blossom. A similar substance is yielded in the East Indies, by the red sandal-wood tree (*pterocarpus santalinus*); and *dalbergia monetaria*, a tree of the same order, yields it in Guiana. Mexican D. B., used in Mexico as a vulnerary and astringent, is obtained from *croton draco* (see CROTON), of the natural order *euphorbiaceæ*. The best kind of all is supposed to be produced by *calamus draco*, an East Indian palm, and part of it is said to be obtained from the fruit of the palm.—D. B. exudes from the surface of the leaves, and from cracks in the stem of the DRAGON TREE (*dracæna draco*), a tree of the natural order *liliaceæ*, remarkable for the size which it sometimes attains, rivaling even the baobab, and of which a celebrated specimen near Orotava, in the island of Teneriffe, was found by Humboldt in 1799 to have a stem about 45 ft. in circumference, and is described as having been of similar gigantic size in the beginning of the 15th century. The stem of the dragon tree is, however, generally short in proportion to its thickness, and its head consists of numerous short branches, terminating in tufts of sword-shaped leaves. It is not supposed to yield any of the D. B. of commerce.

D. B. is opaque, of a deep reddish-brown color, brittle, smooth, with a shining shell-like fracture, and when burned, emits an odor resembling that of benzoin. It is nearly insoluble in water, but is soluble in alcohol, and the solution will permanently stain heated marble, for which it is often used, as well as for staining leather and wood. It is also soluble in oils and turpentine, and enters into the composition of brilliant and much-esteemed varnishes. It was formerly employed in medicine, but is now almost out of use.—An astringent resin obtained from the *eucalyptus resinifera* of Australia is there called dragon's blood.

DRAGON'S MOUTH, or, in Spanish, BOCA DEL DRAGO, is the name of two straits or passages in the new world. One of them is in South America, separating Trinidad from the mainland, and connecting the gulf of Paria with the s.e. extremity of the Caribbean sea. The other is in Central America, being on the n.e. coast of Veragua, the most north-westerly portion of New Granada, and it communicates between the Caribbean sea and lake Chiriqui.

DRAGOON. From the old fable that the dragon spouts fire, the head of the monster was worked upon the muzzles of a peculiar kind of short muskets which were first carried by the horsemen raised by Marshal Brissac in the year 1600. This circumstance led to their being called dragoons; and from the general adoption of the same weapon, though without the emblem in question, the term gradually extended itself till it became almost synonymous with horse-soldier. Dragoons were at one time a kind of mounted infantry, drilled to perform the services both of horse and foot. At present, *dragoon* is simply one among many designations for cavalry, not very precise in its application. In the British army, the *heavy* dragoons and the *light* dragoons are carefully distinguished in regard to the weight of the men, horses, and appointments. The first dragoons in the army were the Scots Greys, established in 1683.

In the British army there are at present 7 regiments of "D. guards," and 21 regiments of "dragoons," besides the 3 cuirassed regiments of household troops. See HORSE GUARDS. In the U. S. army the term Dragoon is not now in use.

DRAGUIGNAN, a t. of France, in the department of Var, on a tributary of the Argens, about 40 m. n.e. of Toulon. It is charmingly situated, in the midst of a valley surrounded by hills, the slopes of which are covered with vineyards and olive plantations.

It is tolerably built; and its streets are adorned with numerous fountains and trees. Its principal structures are the prison, the court-house, a hospital, and a stately clock-tower. It has manufactures of coarse woollens, leather, hosiery, silks, soap, brandy, oil, and earthenware. Pop. '91, 9816. D. is an ancient place. During the middle ages it was strongly fortified. The fortifications were destroyed in the civil wars, but were reconstructed in 1615.

DRAINAGE, in husbandry, is the art of carrying off water from the soil and subsoil of land by means of open or closed drains or trenches—the term, however, is generally understood to apply to closed drains. By its means, the fertility of wet land has been greatly increased. When the drains are put in every 6 or 10 yards, it is called *furrow* or *frequent* draining.

The vast amount of capital which has been expended in D. within a quarter of a century, attests its utility and necessity. Before the introduction of furrow draining, stiff and tenacious clays were of comparatively little value. They were cultivated at much expenditure of labor, and the crops which grew upon them were influenced to a great extent by the variations of the seasons. A system by which wet and worthless land could be rendered dry and valuable, was an improvement so patent to practical men, that we need not wonder at its general adoption.

D. by open ditches was no doubt the first mode of freeing land from superfluous water. The Roman agricultural writers mention the good results arising from covered drains, which were formed of wood and other substances, which served so far to render the land dry. More than a century ago, a large extent of clay-land was drained at narrow intervals in Norfolk and Essex, by putting in brush-wood and even straw in the bottom of the drains. The progress of draining, which is now regarded in many soils as essential to economic culture, was slow and partial, until Mr. Smith of Deanston (well on in the 19th c.) reduced the practice to a system, and showed the principles upon which its efficiency depended. Through the exertions of this advocate, furrow draining soon became a *sine quâ non* in the culture of clay-soils, or indeed any soil, in moist climates.

Practical men consider the line of greatest fall, or quickest descent, as the best for cutting drains in a field. The smaller drains are usually conducted into larger or *main* drains, instead of each discharging its quota of water into the open ditch. This is rendered necessary, as the mouths of the smaller drains would be more liable to be choked up by the growth of weeds; while the collecting of water into main drains secures a fuller flow to sweep out any matters which might accumulate where the discharge was small. Moreover, the less of the action of the air in the drains, the more efficient they are.

The most efficient, and at the same time cheaply cut drain, is made so that a pipe of a cylindrical form may be laid along the bottom, which need be of no greater width than what is necessary to allow of the pipes being properly laid.

Drains of this form are cut with a set of spades which are of different widths—the broader being used for taking out the top, and the narrowest for the bottom. The one which cuts the last spit is called the *bottoming tool*, and its introduction has effected a considerable saving in cutting drains. The pick has often to be used, too, where the subsoil is hard. The cutting of drains is heavy, crushing work. Men employed at this sort of labor are generally paid by the piece; and a professional will make rather above the ordinary rate of laborer's pay. One not accustomed to drain-cutting finds it for some time very hard labor; but experienced hands prefer draining to trenching.

Before the general use of pipes, stones were the common materials with which drains were formed. Mr. Smith recommended that they should be broken so small, that they might pass through a ring two inches and half in diameter. From nine inches to a foot in depth was the quantity which was commonly put in. Where stones can be easily got, they are still preferred to tiles, as cheaper, and if well put in, more efficient and durable. The best plan is to set a pretty large block at each side of the bottom of the drain, and then use a third as a sort of wedge. A coating of smaller stones is surmounted by some turf and the muck.

When tiles and pipes were first used, it was ever thought necessary to have some gravel, or small stones, placed above them in the drains, for the purpose of enabling the water to find its way into them. It was soon found, however, that tile drains were quite as efficient without any stones or gravel; and that they were less liable to be choked up, as the clay or earth acted as a filter in preventing the intrusion of any kind of solid matter.

Many kinds of tiles and pipes have been tried, but the cylindrical form is most used. At one time, a bore in the tile of an inch in diameter was thought sufficient, but 2-in. tiles are now preferred. They are usually made about 15 in. in length. The continuity of the drain is maintained completely by *collars*, which should always be used as a means for securing efficiency and permanency. In soft mossy or clayey subsoils, semi-cylindrical tiles called mugs have been laid, with the bend up, on lath. This is expensive, but is necessary in some cases.

Much discussion has taken place in regard to the proper depth of drains, as well as the distance at which they should be placed. Mr. Smith at first advocated the making

of drains from $2\frac{1}{2}$ to 3 ft. deep, and at intervals of from 10 to 40 ft., according to the nature of the land. Experience, however, has been gradually favoring deeper drains, at wider intervals. Even on the most tenacious soils with subsoils of *till*, few now think of having drains less than 3 ft. in depth, though the distance apart should not in many cases be more than from 15 to 18 feet. The depth, however, depends greatly on the soil— $3\frac{1}{2}$ and 4 ft., with the leader drains 6 in. more, are common dimensions. In mossy land the depth has sometimes to be 7 feet. The width between drains depends on the wetness of the land and the character of the subsoil.

The mere tenacity of clays is not the element which determines the depth of drains, or the distance at which they should be placed apart. It is now well understood that the success of draining by pipes depends upon the fissures which are produced in the subsoil by the droughts of summer never entirely closing up; and thus minute channels are formed, which lead the water into the drains. As the properties of clays become better understood and classified, practical men come to be more at one in regard to this important point connected with the economy of drainage.

The principal advantages of D. are, the deepening of the staple soil, and rendering it more friable, so that a superfluity of water, which would cause the formation of those chemical compounds that are found in stagnant water, is prevented. The greater depth of mold, and more perfect culture, render the soil more absorbent of moisture in dry weather. As crops can usually be sown sooner on drained lands, they also ripen earlier, and produce more abundantly. In short, while drained land obtains a greater capacity for moisture and manure, it imparts to plants greater capabilities for economically working up the materials which they find in the soil and atmosphere, seeing they are maintained in the most healthy conditions of growth.

The advantage of D. consists in that rapid running off of the water which falls as rain, so as to admit of working lands without any undue delay, while natural springs and dampness, from whatever source arising, are also run away with wonderful success. Subsoil D. has been perhaps the most valuable improvement connected with agriculture. See *illus.*, AGRICULTURE, vol. I.; WATER STORAGE, ETC., vol. XV.

DRAINAGE-TUBES, in surgery, are a recent but important addition to the surgical appliances for which this profession is indebted to a distinguished French surgeon, M. Chassaignac. They are composed of India-rubber, from $\frac{1}{4}$ th to $\frac{3}{8}$ th in. in diameter, perforated with numerous holes, and of various lengths. They are especially useful in chronic abscesses (which it may be unadvisable to empty at once) and empyema (q. v.), but also in large wounds, such as those made by amputation, and in all cases where there is apt to be a deep accumulation of discharge. They are introduced in such a manner that one end is on a level with, or projects above the skin; the other is in communication with the seat of discharge; and by allowing that discharge constantly to escape from the external wound, they diminish both chemical irritation from putrid accumulation, and mechanical irritation from pressure. Like all new inventions, it has its advocates and opponents. Thus, while sir William Paget, in his article "Sinus and Fistula," in Holmes's *System of Surgery*, says that "*drainage*, for which the perforated caoutchouc-tube of M. Chassaignac is a very happy invention, is applicable to a great number of cases; but chiefly to those in which a sinus or incomplete fistula depends mainly on pus collecting at a level below or distant from the aperture of discharge, or more generally, when pus is apt to be retained."—Sir William Paget's surgical colleague at St. Bartholomew's hospital, in his article "Abscess," which immediately precedes that from which we have just quoted, objects to the drainage-tube on the grounds that, as a foreign body, it sets up irritation, and adds that "if a proper opening be made, there can be rarely any occasion for a drainage-tube; and however carefully it is inserted, it must of necessity inconvenience and distress the patient." Notwithstanding Mr. Coote's objections, drainage-tubes are now very generally used in surgical practice.

DRAKE, CHARLES DANIEL, b. Cincinnati, 1811; studied and practiced law; went to St. Louis, 1834; representative to the Mo. legislature, 1859-60; member of the state convention, 1863; presidential elector, 1864; member of the Mo. constitutional convention, 1865; U. S. senator, 1867-70; chief-justice, court of claims, 1870-85; wrote *Treatise on the Law of Suits by Attachment in the U. S.*, 1854; *Union and Anti-Slavery Speeches*, 1864; and many occasional orations. He d. in 1892.

DRAKE, DANIEL, 1785-1853; a physician; b. N. J.; graduated at the university of Pennsylvania, 1816. In 1818, he founded a medical college in Cincinnati; also a commercial hospital. In 1823, and following years, he was professor in medical colleges in Philadelphia, Louisville, and Cincinnati. He wrote *An Historical and Scientific Account of Cincinnati*; and *A Systematic Treatise, historical, etiological, and practical, on the Principal Diseases of the Interior Valley of North America, as they appear in the Caucasian, African, Indian, and Esquimaux varieties of its Population*.

DRAKE, Sir FRANCIS, was b. about the year 1539, in a cottage on the banks of the Tavy, in Devonshire. His father was a yeoman, and had a family of twelve sons. He was a zealous Protestant, and during the persecution under queen Mary, he fled from Devonshire into Kent, in which co. his family was brought up. He obtained some kind of clerical appointment among the sea-faring men of the district, and in consequence, D.'s younger years were passed among sailors. He was at an early age apprenticed to

a neighbor of his father's, who possessed a bark, and occasionally made voyages to Zealand and France. When his master died, D. fell heir to the vessel, and carried on the old trade with considerable success. While coasting about, he heard of the exploits of Hawkins in the new world, and the recital took such a hold of his imagination, that selling his ship, he proceeded to Plymouth, and joined Hawkins in his last expedition to the Spanish main. The adventure was disastrous to all concerned, and D. came home much poorer than when he set out. Undismayed, however, he gathered around him wild and reckless spirits, and having raised sufficient money, they fitted out a vessel, and under the command of D., made several voyages to the West Indies. In 1570, he obtained a commission from queen Elizabeth, and cruised in the West Indies, enriching himself with plunder. In 1572, he again sailed for the Spanish main, and, assisted by some other English ships, he plundered the town of Nombre de Dios. He then crossed the isthmus of Darien, and beholding the Pacific, prayed God to grant him leave to sail an English ship in that sea. On Sunday, the 9th Aug., 1573, he came into Plymouth laden with spoil; and when the news spread of his arrival, the people forsook the preacher, and came out to gaze on the brave and successful sea-rover.

Under the sanction of queen Elizabeth, D. again set sail in 1577, taking with him five vessels. He sailed to South America, and plundered the coasts. In Sept. of that year he entered the Pacific. During his voyage, he was singularly successful. He sacked the Spanish towns on the coasts of Chili and Peru, and he captured a royal galleon laden with plate. He then steered for the n.e., hoping to find a passage back to the Atlantic; but the severity of the cold discouraged his crew, and he took shelter in Port San Francisco. He stayed there several weeks, and formally took possession of the country in the name of the queen of England. He then steered across the Pacific for the Moluccas; reaching Ternate, he sailed for Java, thence he stretched right across the Indian ocean for the cape of Good Hope, which he doubled in safety, and arrived at Plymouth on Sunday, the 26th Sept., 1580. He was graciously received at court. Elizabeth banqueted on board his vessel, and conferred on him the honor of knighthood.

During part of 1585 and the whole of 1586, D. was employed, with a fleet of 21 ships, against Philip II. of Spain, chiefly in the West Indies and the coasts of South America. In this, as in his former voyages, he plundered many towns, and enriched himself with spoil. During this voyage, he visited Virginia, which colony had been recently planted by Raleigh. Thence he returned home, and it is said brought tobacco with him.

Spain was now preparing an armada for the invasion of England, and Elizabeth sent D. with a fleet of 30 sail to destroy the enemy's ships in their own harbors. He entered the roads of Cadiz, passed the batteries on the morning of the 19th April, 1587, and before night, destroyed 100 vessels, and possessed himself of immense booty. He then sailed along the coast, burning and plundering. He entered the Tagus, and flouted the marquis Santa Cruz, who was lying in that river with a large force of galleys. Having done all the mischief in his power to Spain, D., with that keen appetite for plunder which never forsook him, steered for the Azores, on the look-out for homeward-bound treasure-ships. He was fortunate enough to encounter a richly laden carrack, of which he took possession. On his return, he spent a considerable portion of his prize-money in supplying the town of Plymouth with water.

D. was next employed as vice-admiral in the fleet under lord Howard, which scattered the armada, and broke the naval supremacy of Spain. In 1589, he was sent to Portugal with a fleet, to expel the Spaniards, who had taken possession of that kingdom; but the expedition was unsuccessful. On his return, he was elected member of parliament for Plymouth. In 1595, along with sir John Hawkins, he was sent with a fleet to the West Indies. In the course of the expedition, the commanders quarreled. Hawkins died before reaching Puerto Rico. Attacking the place, D. received a repulse. Sailing away, he burned and plundered several towns. He came to anchor in Nombre de Dios, where a deadly disease broke out among the soldiers and sailors of the fleet. D. was at last smitten, and after struggling 20 days with the malady, he expired on the 28th Jan. 1596. On the day of his death, the fleet anchored at Puerto Bello, and there the bold sailor and buccaneer received his sea-funeral. See *Life* by Froude (1889).

DRAKE, FRANCIS SAMUEL, 1828-85, son of S. G. Drake. His most important work is his very full *Dictionary of American Biography, including Men of the Time* containing 10,000 notices of persons of both sexes of native and foreign birth, who have been remarkable or prominently connected with the arts, sciences, literature, politics or history of the American continent.

DRAKE, FRIEDRICH, a celebrated German sculptor, b. at Pymont, 23d June, 1805, and trained under Rauch of Berlin. Among his principal works are a "Madonna with her Infant" (purchased by the empress of Russia), a "Dying Soldier," a "Vintager," "The Eight Provinces of Prussia" (colossal allegorical figures, adorning a hall in the royal palace at Berlin), and a "Warrior crowned by Victory," which is reckoned one of the masterpieces of Prussian sculpture. But D. owes his celebrity chiefly to statues, busts, and medallions. There are few great countrymen of his of whom he has not preserved a marble memorial. His statues of Schinkel, the two Humboldts, Rauch, Justus Moeser, his bust of the naturalist Oken, his two colossal statues of Frederick-

William III., king of Prussia, and that of the emperor William I. at Cologne, deserve especial mention; as also the busts of Bismarck and Moltke, and the figure on the victory column at Berlin. D., who was prof. of sculpture in the academy of fine arts at Berlin, d. 1882.

DRAKE, JOSEPH RODMAN, 1795-1820; born N. Y.; one of the early American poets. He studied medicine, graduated, and married a daughter of Henry Eckford, the ship-builder, an alliance which raised him from poverty to affluence. In 1816, he wrote *The Culpriit Fay*, a highly imaginative poem. In 1818, he was in Europe. The next year, in conjunction with Fitz-Greene Halleck, he wrote poetical satires for the *New York Evening Post*, over the signature of "Croaker and Co." He is best known as the author of *The American Flag* (of which Halleck is said to have contributed the last four lines), which many critics consider to be our best national poem.

DRAKE, SAMUEL GARDNER, 1798-1875; born N. H.; in early life a school-teacher. In 1828, he established in Boston an antiquarian bookstore, the first of the kind in the country. He was one of the founders of the New England historical and geological society, of which he was president in 1858. In 1847, he started a quarterly *Register*, of which he was for many years the editor. Among his publications are a number of books on Indian history and wars, on genealogy, and on witchcraft.

DRAMA (Gr. *drama*, from *draō*, I act), or dramatic poetry, in its most general signification, represents *actions*, which are not stately narratives, as in epic poetry, or which do not aim at the musical expression by language of mental emotions, as in lyric poetry. The D. consists of an impersonal representation, by the dramatist, of an animated conversation of various individuals, from whose speech the movement of the story is to be gathered. Thus, it is contrasted, on the one hand, with dialogue, or the dull and changeless flow of discourse, and on the other, with every other species of poetry, whether epic or lyric. In simple dialogue, the minds of the speakers remain unchanged; in the D., the movement of the thoughts is so lively, and the expectation of the issue so vivid, that this species of poetry surpasses every other in interest and in intensity. In epic poetry, persons are frequently introduced engaged in lively conversation, and this is sometimes the case even in lyric poetry, but the prevailing tone of the epopee is descriptive and indirect. A novel, or an epic poem, can only be described as dramatic when it abounds in animated conversations, or when direct action prevails over description. All dramatic poetry may be divided into *tragic* and *comic*. Tragic poetry has for its aim to interest the earnest mind, while comic poetry merely endeavors to produce amusement. Tragic poetry may be described as that which interests the mind in the highest degree possible, and comic poetry as that which engages it in the most complete lawlessness. In comedy, gloom, sadness, sobriety have no recognized existence; while in tragedy, gayety, joviality, riotous mirth are unknown.

While the D., doubtless, arose from that natural love of imitation peculiar to man, and from the child-like liveliness with which a simple narrator loves to recount anything which he has heard or seen, yet the creation of dramatic composition was, nevertheless, a feat of singular boldness. This arises from the wide difference there is between the disjointed elements of occasional imitation and the perfect invention of the genuine drama. The Old Testament, no doubt, contains numerous instances of dramatic dialogue, as in the book of Job; and of lyric poems placed in a dramatic connection, as Solomon's Song; but there is no instance in Hebrew literature of the existence of the D. properly so called. The Hindus have an early dramatic poetry, but, unfortunately, this poetry only dates back to a time when the intercourse between Greece and India was close and frequent. It is to Greece alone that we, accordingly, must look for the invention of the D., and to Athens, in particular, for its perfection. But even here it was originally exhibited only at a few festivals of a single god, Dionysus. There can, then, be no doubt that the origin of the D. is to be sought for in the enthusiasm attendant on the worship of Bacchus. The ancient Greek writers tell us that the D. originated in a choral song; and Aristotle (*Poet.* 4), that it had its origin in the singers of the dithyramb. Supposing that it originated in the pantomimic dances, the dramatic art, like every other, was only slowly purified from extraneous mixtures. Even the origin of the word tragedy has been disputed, although the inventor of it, Arion (580 B.C.), the celebrated dithyrambic poet, is known. Tragedy (*tragōidia*, from *tragos*, a goat, and *ōidē*, a song) is said to have taken its rise from the fact of the old dramas being exhibited when a goat was sacrificed, or because a goat was the prize, or because the actors were clothed in goatskins. Comedy, again (*kōmōidia*, either from *kōmos*, a revel, or *kōmē*, a village), signifies, literally, either the *revelers' song* or the *village song*, from the practice of strolling-players publicly exhibiting their dramatic skill about the streets. Thespis (536 B.C.) introduced the regular dialogue into the choral representations, and joined a person to the dithyrambic songs, who was the first actor. Phrynichus (512 B.C.) used this single actor of Thespis for the representation of female characters, although with him the lyric element predominated over the dramatic. No further improvement of any note was introduced into tragedy before the time of Æschylus.

Comedy, again, arose about 580 B.C., with Susarion, who traveled about through Greece, ridiculing, from a small movable stage, the follies and vices of his time. Tragedy, from its first recognition, was deemed worthy, by reason of its superior

gravity and staidness, to entertain the refined inhabitants of cities; while comedy, at the outset, from its riotous fun and jollity, was judged more in harmony with the rustic habits of the country people. In time, comedy made its way into the city, and Epicharmus (485 B.C.), besides modeling this form of dramatic wit, after its more successful rival, tragedy, likewise introduced a number of distinguished comedians to the notice of the Athenians. Phormes, Magnes, Crates, Cratinus, Eupolis, Pherecrates, and Aristophanes are the highest names in connection with the old Greek comedy, the last mentioned being, however, by far the greatest. Tragedy, both from its ideal character, and from the stately cothurnus and long masks in which the actors of it appeared, aimed at a representation of what was dignified, noble, and grand in human nature. Comedy, again, from its style of caricature, its low-heeled sock, and its grotesque masks, tried to degrade humanity beneath its natural level. Comedy, during the Greek period of its history, divides itself into three forms, viz.: old comedy, middle comedy, and new comedy. The old comedy is the directly opposite of tragedy; its form is essentially sportive, and a seeming aimlessness reigns throughout it. It is, in the opinion of A. von Schlegel (*Lectures on Dramatic Literature*), the only genuine poetic species of comedy, while the other forms of it show a tendency to decline into prose and matter of fact. In the new comedy, again, the form is rather serious than otherwise, and it is regularly tied down to the accomplishment of a certain aim. This is what is understood by comedy at the present day. It is a mixture of tragedy and comedy proper, of earnestness and mirth. Only fragments of Menander and of Philemon, the genuinely witty poets of the new comedy, have come down to us. The middle comedy, again, which came in between the old and the new, arose after the termination of the Peloponnesian war. The new oligarchy strictly prohibited the introduction of living persons by name on the stage; and the chorus, till then the chief instrument of vituperation, is said to have been abolished.

With Æschylus, Greek tragedy properly begins. He instructed his actors himself in the rehearsal of his pieces. In his dramatic compositions he aimed more at sublimity than beauty, more at the heroic than the human. Sophocles, again, who was, perhaps, superior to Æschylus in his appreciation of human nature, strove more to depict idealized men than to paint heroic excellence. He introduced a third actor on the scene, and materially improved the mechanism of the stage. Euripides was too much of a nice speculator to attain to the highest forms of poetic expression. Instead of quietly contemplating life as Sophocles did, he seems to have been morose and peevish; but in point of moral denunciation, no dramatist surpasses him. With these three great poets, Greek tragedy may be said to close. With them it ceased to be the tragedy which Aristotle has described in his celebrated definition of it. "Tragedy," he says (*Poetics*, 6), "is the imitation of some action that is serious, entire, and of a proper magnitude; effecting, through pity and terror, the refinement of these and similar affections of the soul." In the hands of the subsequent authors this form of the D. grew lax and effeminate, and in the performances of Theodectes especially, tragedy was made to give way to rhetoric. (See the works of Böckh and Welcker on the Greek tragedians; also, Müller's *Literature of Ancient Greece*.)

The Romans were not a great dramatic people. They borrowed, according to the common account, during a period of national despondency occasioned by a desolating pestilence (A.U.C. 391), their first idea of a play from the Etrurians; their effusions of sportive humor, their *Fabule Atellanæ*, from the Oscans; and the higher class of dramatic compositions from the Greeks. Philology, likewise, countenances this story; for *histrio*, the Latin word for a player, is pure Etruscan. No remains of any note have come down to us of the comic writers of Rome, except Plautus and Terence. The former was a poor day-laborer, the latter a Carthaginian slave. The habits of each appear in their writings. Plautus has a degree of rough vigor and broad jocularly, born of the hand-mill and the plow, while Terence is more refined and delicate in his wit and characterizations. Both these writers borrowed largely from the Greeks. Of the early period of Roman tragedy no remains exist, but it is probable that its poets were merely translators or imitators of Greek models. The tragedians of the Augustan age were ambitious of rivaling the Greeks. Unfortunately, none of these grand attempts have come down to us, except ten bombastical and frigid dramas, that go under the name of Seneca.

Ancient art fell with pagan Rome. In the early ages of Christianity, any one connected with the theater was not allowed baptism. The unwise zeal of the fathers was followed by an edict of the emperor Julian to the same effect. The two Apollinarii, father and son, and Gregory of Nazianzen, attempted to introduce religious plays or mysteries, drawn from the Scriptures, to amuse the Christian people during the operation of Julian's law. In a short while, instead of the D. proper, there was nothing to lighten up the surrounding darkness but such productions as the saturnalian pageants, the Feast of Fools and the Feast of the Ass.

The Italians are the first people of Europe, who, after the long sleep of the true dramatic spirit in the middle ages, strove to enkindle the ancient fire upon Roman hearths that had for long years been cold. Early in the beginning of the 16th c., the first regular modern D. was published. It was called *Sophonisba*, and the writer was a very commonplace author, by name Trissino. Shortly after, this tragedian was followed by

Ariosto, by Babbiena, and by Macchiavelli, all distinguished cultivators of the classic comedy. Towards the end of the century, Giambattista de la Porta, philosopher and comic writer, exhibited a number of pieces of a familiar, and sometimes even farcical kind, but full of happy invention and agreeable originality. The political influence of Spain was now at its height on Italian territory, and the romantic D. of the west gradually found favor in Italy. Even so early as 1529, Ricchi had attempted to overthrow the classic taste in Italy, but without success. It remained for Borghini, Oddi, and M. A. Buonarroti, the nephew of the great artist, and one or two other writers, to break in upon the current taste, and to do much to introduce the romantic D. in Italy. In the 17th c., Rinuccini, by the union of music with the romantic D., succeeded in establishing the *melodrama*. Tragedy and comedy were now entirely laid aside as antiquated, and nothing but the *musica opera* was heard of from Milan to Ravenna. Maffei led the way in reforming the Italian stage. The political preponderance of Spain had now given way to that of France, which facilitated his labors not a little. His *Merope* is a fine attempt to restore the tragic D. to Italy, but as Lessing says of it, in his *Dramaturgie*, it is rather the production of a "learned antiquary" than of a great tragic poet. The musical D. had now to be rendered classic, and this task was undertaken by Zeno and Metastasio. The latter, who has all the attractiveness for the Italians that the classic Racine has for the French, by subtle harmony and grace in his songs, by his power of painting pathetic situations, and by his melting effeminacy of manner, charmed the hot southerners as no other poet yet had done. After Goldoni, a great comic authority in Italy, and a careful student of Macchiavelli and Molière, except Riccoboni and Gozzi his rivals, we have few dramatists of any note till we come down to last century. The bold and passionate Alfieri inaugurated a new era in Italian tragedy. He is a follower of the classic school, and a strict observer of the Aristotelic unities. His successors have relaxed more their adherence to classic forms, and have produced some very admirable dramas. Among the most estimable of those writers are Monti, Manzoni, and Niccolini.

In the other European nations as soon as dramatic composition rose to any degree of purity, it became thereby disconnected with the church. But in Spain this is by no means the case, for their best poets, while writing for the stage, have busied their pens in the composition of religious dramas. Passing over the names of Villena, Santillana, Naharro, and Rueda, as diligent but comparatively weak builders of the fame of the Spanish D., we come to the periods of Cervantes, of Lope de Vega, and of Calderon, when the Spanish stage may be regarded as in its best condition. In his *Numantia* particularly, Cervantes, whose genius was more decidedly epic than dramatic, has left to the world a specimen of tragic invention and of moral dignity which it is not likely to forget. While the critics were clamoring about the classic rules and the Aristotelic unities, Lope de Vega appeared on the scene, to set nearly all the dramatic laws at defiance. He is the most fertile dramatic writer in the world, besides being one of the best. Yet he prostituted his pen to serve the public, and sacrificed his future fame to his living popularity. Calderon, who succeeded him, possessed all his advantages, with the important additional merit of being thoroughly devoted to dramatic art as to a mistress. So great was Calderon reckoned in the composition of religious plays, that by letters-patent he enjoyed a monopoly of these productions for 37 years. The brilliant period of the Spanish theater, comprising the first half of the 17th c., had with the death of Calderon well-nigh closed. Except Moreto, Tirso de Molina, and Solis the historian, there is no writer of any note to engage the attention.

We come now to France, where the unities, as they are called, have been observed with as much strictness as if the country had been an old Grecian province. This is chiefly owing to the influence of the criticisms of Boileau, who adopted the dramatic unities in all their severe rigor. The critics of other nations, particularly of Germany and of England, have chosen to condemn this exposition of the D., and sometimes to despise even the Stagirite as a dramatic critic. The dramatic unities are threefold—action, time, and place. According to the French, these unities have the following significance: 1. That the action of the D. must be one—that is, that the interest or attention must not be distracted by several plots, but everything must be subservient to the main action. 2. That all the actions must take place on the same spot, or very nearly so, in order that the illusion may not be disturbed; and 3. Everything should happen on the same day for the same reason. Much has been written for and against these rules. Suffice it to say, that these are the landmarks on which the classic dramatist fixes his eye. Previous to Jodelle, or indeed to Corneille, hardly any progress had been made in the regular D. in France. A number of writers, of more or less ability, had produced *mystères*, *soeties*, *moralités*, *farces*, in which, in numerous instances, the romantic or anti-classical tendencies of human nature had manifested themselves; but neither in the case of the brethren of the Passion, nor in the case of the *Enfants sans Soucis*, was there any progress made in the proper business of dramatic composition. Jodelle was the first writer who composed a regular five-act tragedy, and he publicly exhibited it in the presence of the court of Henry II. of France. He composed other pieces of equal, many of superior, merit, but nothing of any importance in the D. appeared before the time of Corneille. This writer, who appeared in the reign of Louis XIV., during the time that the star of Richelieu was in the ascendant, had to humor the court by humor-

ing the academy, and to please the academy he required to observe the rules of Aristotle. He produced seven plays, as cold and as severe as if they had been written by Sophocles, but of great elegance and dignity of style, when it struck him that he might give more free scope to his romantic tendencies in the tragedy of the *Cid*. All Paris rang with its praises, but the academy gloomed, and poor Corneille had to betake himself again to the dignity and severity of the Greek drama. He got what he longed for, however—a seat among the members of that institution which had been so instrumental in repressing the spontaneous outflow of his genius. It was more than his successor, Molière, obtained, who insisted to the last on playing his part as well as penning his pieces—an abuse which the dignified academicians could by no means tolerate. The genius of this dramatist was decidedly comic, and it may perhaps be questioned, whether, in all the essentials of true comedy, Molière's is not the very foremost name in the history of the stage. He borrowed much from the Spaniards, though perhaps less than Corneille; a great deal from the Latins; and more perhaps from the Italians. But the favorite tragic poet of the court of Louis XIV. was Racine. His genius lay decidedly towards the serious and the exalted, so that he had no temptations, like Corneille, to trespass the bounds of the academic proprieties. In tenderness and elegance, all French writers give way before him. In his *Athalie*, his last and best D., he gave to the Parisian public a composition, such as in breadth, in elegance, and in severe grandeur, it could nowhere find out of the Greek theater. But we must push through the crowd of lesser lights which shone on the decline of Racine and Molière, and glance at that bright and fitful luminary—Voltaire. He pressed boldly forward, and astonished all Europe with the force and power of his romantic dramas, a style of composition which, since the *Cid* of Corneille, had been altogether excluded from the theater. His spirit of intolerance was perhaps felt in his dramas, and his increasing warfare with superstition and fanaticism was too distinctly experienced even in the theater. But his genius and spirit have earned for him a place beside Corneille and Racine as one of the tragic names whom France delights to remember. Boursault, Regnard, Legrand, Lemercier, Victor Hugo, Dumas, and Alfred de Vigny, would all require to be noticed in a full view of the French drama.

The German D. is almost wholly dependent for its fame on the names of Lessing, Goethe, and Schiller. For while Rosenpluet, Hans Sachs, and Ayer were original, and some of them fertile; while Gryphius, Gottsched, Gellert, and Schlegel show a decided advance in the appreciation of the laws of dramatic composition; yet from the feebleness of the writers, and from the backward state of theatrical taste in the end of the 17th and the beginning of the 18th centuries, very little was done towards a clear and distinct recognition of the excellence of dramatic literature, till the critic Lessing, in his *Miss Sara Sampson*, taught Germany to appreciate the productions of the romantic drama. As a critic, he blamed the French, praised Shakespeare, and professed belief in Aristotle. He held more than one dramatic heresy, and his antipathy to versification was among the number. Goethe is, without doubt, one of the greatest geniuses which the world has seen, but whether he is entitled to so high a place for his theatrical dramas remains an open question. As his aim was more emphatically the culture of his genius in its fullest form, the circumstance of his writings assuming the dramatic form is rather an accident than otherwise. From first to last he seems to have been distinctly aware of this, and in the prologue to his last, and by far his grandest production, he declares why he could not accommodate his genius to the demands of a mixed theater. Yet his *Faust* must ever be regarded as one of the grandest and most remarkable compositions which modern Europe has witnessed. Schiller was more expressly the dramatic poet of Germany than Goethe. While Goethe's genius was fuller and more complete, Schiller made up for what he wanted in breadth of vision by the moral intensity of his genius. From his wild play of the *Robbers*, down to his last D. of *Wilhelm Tell*, he worked with a vehemence such as has very seldom been witnessed. But he filled Germany, and indeed all Europe, with his tragic fame, and his name is one which "posterity will not willingly let die."

Dramatic exhibitions in England, if they did not originate in the church, were nevertheless speedily appropriated by the clergy. Ecclesiastics were frequently the composers of the religious pieces, or mysteries, and they were found not seldom to be the actors. The mass of the people, no doubt, owed a good deal of grotesque amusement, and even of occasional information, to the Biblical and legendary history, which those rude attempts at the D. were fitted to convey. Those old religious plays are generally divided into two classes—*miracles* or miracle-plays, and *moralities* or morals. The former were founded on Scriptural narratives, or on the legends of the saints; the latter arose from the former, by the increased introduction of imaginary features. These pious pastimes existed long before the reformation, and were not overthrown by that great revolution in the opinions and beliefs of the country. See MYSTERIES. It was about the middle of the 16th c. that the D. extricated itself completely from these ancient fetters. By this time both comedy and tragedy had begun to exist in a rude reality in England. The oldest known comedy (before 1557), that of *Ralph Roister Doister*, was written by Nicholas Udall, a school-master of considerable learning, probably about the middle of the 16th century. Ten years after appeared our first tragedy, known variously as *Gorbudoc*, or as *Ferrex and Porrex*, by Mrs. Norton and lord Buckhurst. And not only is this work the earliest tragedy in our language; it con-

ains, beside, the first application of blank verse to dramatic composition. But the play is dull, heavy, and declamatory. The D. lingered in this incipient condition until very near the time of Shakespeare. Bishop Still's *Gammer Gurton's Needle* is no improvement on *Roister Doister*. The names of Kyd, Lodge, Greene, Lyly, Peele, Marlowe, Nash, etc., must pass before us almost without comment. Many of these writers are not without their merits, particularly Marlowe, whose plays of *Edward II.* and of *Dr. Faustus* are acknowledged by Charles Lamb to contain passages that Shakespeare himself has not surpassed. Marlowe, besides, is the first author who introduced blank verse upon the public stage. But all these dramatists are obscured by their nearness to the great luminary of the English drama. Shakespeare is now almost universally acknowledged to be the greatest dramatic genius that has ever appeared in the world. He brought the romantic D. to a perfection which it is not likely to surpass. His writings present the finest example of the depth, sublimity, refinement, and variety of which the D. is capable; and they are abundantly marked by those peculiar characteristics which sprang from the union, in the person of its author, of such wonderful powers of conception with such familiar experience of theatrical management. Of course he despised the unities, or rather, we might say, he worked in ignorance of them, for he knew nothing of Aristotle and Boileau; and the rest of the French critics were not born when he died. Hence his D. is known in literature as "irregular;" and, we fear, human nature is likewise very irregular. The poet trusted to his own instinctive judgment, and of its exercise we have all fortunately plenty of examples. The principal of Shakespeare's contemporaries are Ben Jonson, and Beaumont and Fletcher. Like Shakespeare, Jonson wrote both tragedies and comedies. Milton speaks of "Jonson's learned sock," and thus hits off the main feature of his character as a dramatist in a phrase. Beaumont and Fletcher, who were, like many brotherly men in that age, joint-workers, have the honor of standing next to Shakespeare in the romantic D. of England. But, like Lope de Vega, they wrote too much for the mere success of the moment to be ranked in the foremost file of England's dramatic writers. With Massinger, Ford, and Shirley, the old English D. is closed. Dryden, the literary chief of his age, who flourished during the latter half of the 17th c., wrote some fine pieces of Frenchified declamation. Lee, and the unfortunate Otway, bring down the D. to the beginning of the 18th century. For, while Gay, Congreve, Cibber, Wycherley, Vanbrugh, and Farquhar, all display considerable dramatic spirit and invention, their works are, nevertheless, morally considered, the foulest things in the language. They paint well the externals of society, and have left behind them good specimens of the "comedy of manners," as it has been called; but vice is both warp and woof of nearly everything they have produced. Addison, Johnson, Young, Thomson, etc., wrote some good poetry, but poor dramatic verse; while Lillo, Moore, Garrick the actor, Goldsmith, the Colmans, and Cumberland, nearly all took to prose instead of verse. They produced agreeable comedies, but nothing of a very marked kind in the history of the D. appears until the time of Sheridan who gave an impulse to "genteel comedy," such as has placed him ever since at the head of the writers of that species of composition. Holcroft, Mrs. Inchbald, "Monk" Lewis, and Maturin, mostly influenced by inferior German writers, have left behind them a legacy of terror and of wonder fit to render their period marvelous, if for nothing else. Joanna Baillie and Sheridan Knowles remind the reader of the excellences of the old English D., and the *Lady of Lyons* of Bulwer Lytton is a favorite with playgoers of the present day. Byron, Coleridge, and Henry Taylor are the authors of fine meditative dramas, but they are more suitable for the closet than for the stage. Our sketch would not be complete without allusion to Talfourd, Jerrold, Shirley Brooks, Marston, Tom Taylor, Charles Reade, Robertson, Wills, H. J. Byron, and Gilbert. Swinburne, Tennyson, and Browning have also written works in the dramatic form.—See Ward's *History of English Dramatic Literature* (London, 1875), and works by Collier, Fitzgerald, and Archer.

American Drama.—In the United States it is difficult to separate the English and American drama. The sameness of language, the similarity of dramatic themes, and the free and constant intermingling professionally of American and English artists, make a homogeneous whole rather than separate branches. The literature of the drama in the United States is very extensive; but, as in England, a great proportion of it is of little value. It was some time after the establishment of independence before the dramatic muse began to work; and the earliest productions were naturally based upon our warlike achievements, the glories of our battle-fields, the invincible courage of our heroes, and the ignominious defeats of the enemy. It scarcely needs be said that such dramas, following like shadows upon events so recently passed, were veritable trash, not only in a literary but in an acting view. Centuries must roll by ere Lexington, and Saratoga, and Yorktown can become fit subjects for dramatic treatment. Shakespeare's historical plays took little hold of the English public until Garrick entered into the body and soul of Richard III., three hundred years after Bosworth field and a century after the death of the swan of Avon. The first theater to open after the departure of the British troops was that in John street, New York, 1785. All the players of note were English, and so were the plays. The first play by an American author presented on the stage was *Contrast*, written by Royal Tyler, afterwards chief-justice of Vermont. It was a poor affair, but served to introduce to the boards that abomination known as the

exaggerated "Yankee," which could not be banished for three quarters of a century. William Dunlap was the first prolific American dramatist, some of whose work was fair for the period, while much more of it was poor. He produced about fifty plays, some of which were translated from the German. The building of the Park Theatre, New York (opened Jan. 29, 1798), gave the drama a fresh start, although all the chief players were from the old country, and the opening play was *As You Like It*. On Jan. 24, 1809, "the American Roscius" made his début on the Park stage as "Young Norval," following with more solid characters. This lad was John Howard Payne. He wrote and translated a number of plays, of which his own tragedy *Brutus, or the Fall of Tarquin*, still keeps the stage. It is a powerful, well-constructed tragedy, and bears comparison with those of any English writer excepting only Shakespeare; moreover, it is the first drama of importance written by an American author. It was not until about 1820, that literary and cultured people began to look with favor upon the drama. The Park Theatre was burned in May of that year, but was rebuilt and opened in Sept., 1821, when Charles Sprague, then among the foremost of native poets, wrote the inaugural address, and Samuel Woodworth, another poet of high standing and also a dramatist, wrote the prize poem. Soon after this period, play-houses began to multiply, and the solid phalanx of English artists was now and then broken by the invasion of American players, none of them, however, destined to achieve greatness. There were some who rose to local celebrity; such as Rosalie Pelby, Anne Jane Henry, Caroline Placide, Alexina Fisher, then a mere child, and Julia Wheatley, a singer. Further impetus was given to the American drama by the presence of the great tragedian Edmund Kean, who played two short engagements in New York and Philadelphia. Opera also began to appear in force under Signor Garcia and his daughter Felicité, afterwards the renowned Malibran. In 1826, James K. Hackett made his first appearance as "Sylvester Daggerwood." He became famous in "Falstaff" and "Monsieur Tonson," in Yankee parts, and especially in "Sir Harcourt Courtly." Kean was hardly gone when Edwin Forrest made his first effort in a Shakespearean part as "Othello," June 24, 1826. Forrest is held in memory by a large majority of his countrymen as the greatest of American tragedians. The two Wheatley families (one English and one American) were coming into prominence about this period. Forrest, always intensely American in feeling, undertook to infuse the native idea into his work. He appeared in John A. Stone's *Metamora* (written for Forrest), and especially engaged Dr. Bird of Philadelphia to write a new play. The result was *The Gladiator*, a Roman episode removed as far as possible from this new world. Bird also wrote *Oraloosa*, another Indian piece. Stone was a native of Massachusetts, and the author of *Fauntleroy*; *Tancred of Sicily*; *Laroque, the Regicide*; and other dramas. He committed suicide when but 33 years of age. In 1830-31, two noted delineators of Yankee parts appeared in Danford Marble and George H. Hill, and were popular in a low grade of plays for many years. The season of 1832-33 brought over Charles and Fanny Kemble, who enjoyed immense popularity. The year before, the celebrated Ravel family had taken the people by storm, but they had no connection with the drama. In the spring of 1833, again appeared the great and erratic Booth, father of Edwin. He had appeared first in the United States, Oct., 1821. "Master Burke," or Charles S. T. Burke, one of the best of American comedians, appeared in 1836. In the same year, Misses E. and J. Anderson, granddaughters of the first Joseph Jefferson, made a successful beginning. The first became successively Mrs. Thoman and Mrs. Saunders, and the other Mrs. Gernon, mother of Effie, artists by birth. Nathaniel H. Bannister, a native of Delaware, started in 1813, and acquired considerable reputation, both as actor and dramatic author. Then came a mere boy, at the obscure National theater, one destined to be the foremost of American comedians—Joseph Jefferson, son of Joseph, grandson of the first Joseph, and half-brother of Charles Burke. These great artists illustrate the truth of hereditary transmission. About this time, James E. Murdoch, a Philadelphian, began to make his mark in tragedy. In 1836, appeared Miss Jean Margaret Davenport, an infant phenomenon. She became the wife of Col. Frederick W. Lander, and during the war between the states she was a devoted nurse in the hospitals of the union army. Charlotte Cushman, the greatest of American actresses, now threw the light of her powerful genius and individuality upon the stage. In 1838, Mary Cecilia Taylor ("our Mary") made her début, and became perhaps the most popular favorite ever known in New York city—a very clever and versatile though not a great actress. "The Shaws," as three talented sisters were called, were now coming prominently forward. They were Regina (first, Mrs. Charles Howard, and then Mrs. H. Watkins), Mary (first, Mrs. Fogg, and then Mrs. Krollman), and Josephine (first, Mrs. Russel, and then Mrs. John Hoey). All had more than ordinary talents, and were great favorites. Edward Eddy, b. in Troy, N. Y., appeared in 1839; a very heavy tragedian and melodramatic actor. In the same period came Joseph Proctor and his wife (Miss Hester Warren). John Gilbert first appeared in New York in 1839, and has ripened into the most accomplished "old man" on any stage. He was born in Boston in 1810, and made his début there in 1828.

Thus we struggled on with English plays and English players, except as above mentioned, until John Brougham, an Irishman, came over (in 1842) to stay. He was the first author to put life into the play-bills. Though not born here, his work was essentially American, especially those inimitable burlesques, *Pocahontas* and *Columbus*. He was also the best Irish and general comedian of the day. In June, 1844, a bright par-

ticular star appeared in the person of Anna Cora Mowatt, who was for several years the reigning favorite in genteel comedy and light tragedy.

In the second half of the present century the annals of the American stage have been filled with names that justly receive honor as those of admirably trained artists in every department of dramatic study. In tragedy, it is only necessary to recall Edwin Forrest, already mentioned, Edwin Booth, the most scholarly and thoughtful of American actors, John McCullough, best remembered for his manly impersonation of Virginius, Edwin Adams, whose premature death cut short a career of the greatest promise, and Lawrence Patrick Barrett. In legitimate comedy John Gilbert and Joseph Jefferson led the way, and were followed by Lester Wallack, William J. Florence, John T. Raymond, William Davidge, John Drew, F. S. Chanfrau, W. J. Lemoyne, James Lewis, and W. Leclercq. Of late the popular taste has turned to comedy of a somewhat lighter and more farcical character than of old, and many extremely clever and versatile impersonators have answered the demand. Of such comedians the best known names are those of Henry E. Dixey, whose natural ability leads one to regret that he has not chosen legitimate rather than farce-comedy, Neil Burgess, Edward Harrigan, famous for his Irish-American character sketches, William H. Crane, John Wild, Francis Wilson, Jefferson de Angelis, M. B. Curtis, Eugene Canfield, Mark Smith, De Wolfe Hopper, N. C. Goodwin, and Willie Edouin. Of talented and accomplished women, the American stage is proud to claim many who have now a fame that is truly international. Such are Miss Mary Anderson (q.v.), most successful in such rôles as "Galatea," "Juliet," and "Rosalind," and Miss Ada Rehan (q.v.), who stands by universal consent at the head of American comédiennes. Scarcely less known names are those of Mrs. D. P. Bowers, Charlotte Cushman, Madame Ponisi, Mrs. J. H. Gilbert, Charlotte Thompson, Matilda Heron, Mrs. W. J. Florence, Clara Morris, Rose Coghlan, Grace Henderson, Annie Russell, Enid Leslie, Louise Dillon, Maggie Mitchell, Mrs. Yeamans, "Lotta," Annie Pixley, Isabelle Irving, Annie Robe, and Caroline Hill.

The American stage has, in fact, always been much stronger in native players than in its native playwrights. This has been largely due to the absence until 1891 of an international copyright. A manager could always adapt, translate, or reproduce outright at no expense and little risk, a play that had met success abroad; whereas, to purchase one from a native writer involved at the outset a definite outlay, and the subsequent risk of failure. In the list of those Americans who have nevertheless met a complete or partial success in the face of this discouragement may be mentioned David Paul Brown, N. P. Willis, Julia Ward Howe, George H. Boker, Epes Sargent, John A. Stone, Robert M. Bird, Lester Wallack, H. H. Boyesen, Henry Guy Carleton, Steele Mackaye, Bronson Howard, Bartley Campbell, and Mark Twain. Mr. Augustin Daly (q.v.) has shown great cleverness in adapting from the German, many light comedies that have been so thoroughly Americanized as to seem original compositions. The fun-loving public has been made to laugh at the eccentric and uproarious, but perfectly clean and wholesome farces of Mr. Charles H. Hoyt, who in *A Midnight Bell* (1888) has shown a capacity for higher things. Mr. Edward Harrigan has inimitably portrayed certain phases of low life in New York in his well-known series of plays. Mr. H. C. De Mille and Mr. David Belasco are equally successful in what is popularly known as the "society drama." But probably nothing that the American stage has yet seen is so racy of the soil, and so thoroughly and truly national, as the two plays evolved by Mr. Denman Thompson (q.v.), *The Old Homestead* and *Joshua Whitcomb*. From a literary point of view, these dramas of New England life are seriously defective, but their exquisite truth, their genial humor, and their simple fidelity to nature, have charmed both the general public and the most exacting and scholarly of critics.

To Mr. Augustin Daly, the American stage owes a debt that will always be most cheerfully acknowledged. To him is due the maintenance and training of a company that may without fear of contradiction be ranked with the best of the companies that in Europe are subsidized by the state and encouraged by feelings of national pride. Never before has our country felt and understood the possibilities of the dramatic art, as it has done since Mr. Daly in his Shakespearian revivals revealed them. The absurd "star" system, by which one great actor or actress was expected to atone for the shortcomings of a supporting company of incapables, has received its death-blow now that the public has learned how much of the success of any play depends upon the *tout ensemble*—the proper adaptation of one part to another, the intelligent comprehension of the whole, and the subordination of each character to artistic completeness. America may well be proud of the enthusiastic verdict of both the German and the English press upon the exquisite art of this admirable company of comedians.

For a fuller treatment of matters relating to the drama, the reader is referred to the articles that deal with the individual actors and authors mentioned above; to the articles (THEATER; COMÉDIE FRANÇAISE; and to the following works of reference: *The Stage and its Stars* (40 pts., 1888—); Donaldson, *The Theatre of the Greeks*, 8th ed. (1875); Wright, *The Second Generation of English Professional Actors* (1883); Matthews, *The Theatres of Paris* (1880); French, *Dramatists of the Nineteenth Century*, 2d. ed. (1891); Brereton, *Some Famous Hamlets* (1884); Fitzgerald, *A New History of the English Stage* (1882); Seilhamer, *History of the American Theatre* (1889); Hennequin, *The Art of Playing* (1890).

DRAMATIC WORKS, COPYRIGHT IN. See **COPYRIGHT.**

DRAMMEN, a seaport town of Norway, on both sides of the river Drammen, which here discharges its waters through the Drammen fiord into the gulf of Christiania, about 24 m. s. w. of Christiania, with which it is connected by railway. D., which is built in a valley, is divided into three quarters—Bragenes on the n. bank of the river, and Stromsøe and Tangen, on the s., united to the first-mentioned quarter by a handsome bridge. The manufactures of D. are sail-cloth, rope, carriages, tobacco, and earthen-ware, and its chief exports are timber, wood pulp, paper, iron, and pitch. It has a numerous merchant marine. Pop. '91, 20,687.

DRANESVILLE, a district in Fairfax co., Va., about 18 miles w. of Washington. A battle was fought here, Dec. 20, 1861, between the unionists and the confederates. It was an artillery duel, important only as the first success gained by the union army of the Potomac. Pop. '90, 2994.

DRAPER, ANDREW SLOAN, was born at Westford, N. Y., June 21, 1848; admitted to the bar, 1871; was one of the judges in the court of Alabama claims, 1884; president of the University of Illinois, 1894; has published *The Origin and Development of the N. Y. Common School System*, 1889, etc.

DRAPER, HENRY, M.D., 1837-82; b. Va.; son of John William; d. New York. He studied at New York univ., 1852-54; began medical practice, 1858; was on the Bellevue hospital staff, 16 months; prof. of physiology in the univ., 1860; prof. in the medical school, 1866-73; afterwards taught analytical chemistry in the univ. Dr. D. made important discoveries in photo-chemistry; published *Text-Book of Chemistry*, 1864, and many articles on photography, spectroscopy, etc. His diligent investigations greatly advanced the departments of science to which his labor was directed.

DRAPER, JOHN CHRISTOPHER, M.D., was born in Virginia in 1835. He entered the university of New York in 1852. Though he subsequently ceased the study of the classics, he attended the course in medicine, graduating in 1857. From March, 1856, for a period of sixteen months he held the position of house physician and surgeon at Bellevue hospital. In 1856 he published papers on *The Production of Urea*, and *Experiments on Respiration*. In 1857-58 he travelled and studied in Europe. From 1858-61 he occupied the chair of analytical chemistry in the university of New York. During a portion of this period (1860-63) he was professor of chemistry at Cooper Union, and for three months of the year 1862 served in the field as assistant-surgeon to the Twelfth regiment of New York. In 1863 he became professor of the natural sciences at the college of the City of New York, and in 1866 a professorship in the medical department of the university of New York was conferred upon him, both of which positions he held till his death, in 1885. In 1873 Trinity college bestowed upon him the degree of LL.D. He was a member of the New York academy of medicine, contributed many articles to medical and scientific journals; was editor in 1872-73 of the *Year-Book of Nature and Science*, and for three years had charge of the department of natural sciences in *Scribner's Monthly*. His other important works were a *Text-Book on Anatomy, Physiology and Hygiene* (1866); *A Practical Laboratory Course in Medical Chemistry* (1882); and a *Text-Book of Medical Physics* (1885). He died 1885.

DRAPER, JOHN WILLIAM, American chemist and physiologist, was b. near Liverpool, England, May 5, 1811, and educated at a Wesleyan school at Woodhouse Grove, and later pursued his studies in chemistry under Dr. Turner of the London university. In 1833, he joined some of his relations who had emigrated to America, and in 1836, took his degree of doctor of medicine in the university of Pennsylvania, and was appointed professor of natural philosophy, chemistry, and physiology in Hampden Sidney college, Virginia. In 1839, removing to the city of New York, he was connected with the preparatory department, and in 1841, joined Drs. Mott, Patterson, etc., in founding the medical college of New York university, in which he was at first professor of chemistry, and in 1850, of physiology. D. was a clear and able lecturer, and a voluminous writer, having been a liberal contributor to the *American Journal of Medical Science* and the *Edinburgh Philosophical Journal*, and published a treatise on *The Forces which produce Organization in Plants* (4to, 1844); *Text-book of Chemistry* (12mo, 1846); *Text-book of Natural Philosophy* (8vo, 1847); *Human Physiology, Statical and Dynamical, or the Conditions and Course of Life in Man*. Dr. Draper also published *History of the Intellectual Development of Europe*; *Thoughts on the Future Policy of America* (1865); *Philosophical History of the Civil War in America* (1867-70); *History of the Conflict between Religion and Science* (1874). He d. 1882.

DRAPIER LETTERS were written by Dean Swift over the signature "M. B. Drapier," in which he counseled the people of Ireland not to receive the money coined by William Wood, to whom the English government had granted a patent in 1722 to supply a deficiency in the coinage of that country of more than £100,000. The letters made a great sensation in Ireland, and caused the patent to be canceled, but not until about £80,000 in half-pence had been coined. Popular feeling was so intense at the time that Wood was forced to leave the country. See **SWIFT, JONATHAN.**

DRAUGHT, or DRAFT, OF WATER, is a technical name for the depth to which a ship sinks in the water when fairly afloat. When a ship is in good trim the D. does not

differ much at the two ends. For D. as applied to plows, wagons, etc., see CART; Plow; STEAM-CARRIAGE; WAGON.

DRAUGHTS, like chess, is a game played with "men" on a checkered board. As far as the science of the game is concerned, it falls far short of chess, but is nevertheless a favorite recreation with many classes of people. In France it is called *les dames*, from its having been a favorite game with ladies; and in Scotland the draught-board is called the *dambrod*.

Two persons usually play this game, each having a set of twelve men—one set black, the other white. The men may be placed either on the black or white squares, but the whole must be placed on one color only. Thus, in England, it is usual to play upon the white squares, with a black square to the lower right, and in Scotland upon the black, with a white square to the lower right. In chess, the men may be moved straight forward, sidewise, or diagonally, and over many squares at once; but in D., the men may be moved diagonally only, and by one square at a time. If an enemy's man stands in the way, no move may take place unless there be a vacant square beyond into which the piece can be lifted. The man leaped over is then taken and removed from the board. The grand object of the game is, therefore, to clear the board of the enemy's men, or to hem them in so that they cannot be moved, and whichever party does so first, wins the game. As no piece can move more than one step diagonally at a time, there can be no taking till the antagonists come to close quarters; and the advancing of them cautiously into each other's neighborhood is the chief art of the game. When a man on either side has made his way, either by taking or by a clear open path, to the opposite side of the board, he is entitled to be "crowned," which is done by placing another man on the top of him. Crowned men may move either backwards or forwards, but always diagonally and by one square at a time, as before; and this additional power thus gained gives a great advantage to the player who owns the greatest number of crowned heads, and usually decides the game in his favor.

DRAVE (Ger. *Drau*), a river of Austria, rises in the e. of Tyrol, in lat. 46° 45' n., and long. 12° 25' e., flows n.e. through the Pusterthal towards Lienz, where it is joined by the Isel. It then flows e. through Carinthia, passes Villach, where it becomes navigable, after which it passes Marburg, receives the Dran from the right, and the Mur, its principal affluent, from the left; then turning towards the s.e., it forms the boundary between Croatia and Slavonia on the right, and Hungary on the left, and pours its waters into those of the Danube at a point 10 m. e. of Essek, the capital of Slavonia. The D. is nearly 465 m. long. In the first part of its course, it is a mountain torrent, rushing furiously through the mountain passes of Tyrol; but joined by numerous streams, its volume increases, and its course becomes more staid. The valleys through which it flows in its course through Carinthia, Styria, and Croatia, are distinguished by great fertility and picturesque scenery, while the population upon its banks is numerous and industrious. In Slavonia, the D. is frequently bordered by dense forests.

DRAVIDIANS is a name given to a large group of the non-Aryan races of southern India, including those speaking Tamil, Telugu, Canarese, Malayalam, Toda, Goud, and six other tongues of minor importance—in all nearly 50,000,000 of people. These languages are all distinguished by having a rational and irrational gender of nouns, which in the verbs also are indicated by pronominal suffixes. Thus, "they did it" is different in Tamil according as the nominative is rational or irrational. Another characteristic of the Dravidian languages is the absence of the passive voice. Rask did much to establish the Dravidian group; the second edition of Bishop Caldwell's great work, *Comparative Grammar of the Dravidian Languages* (1875; the 1st ed. having appeared in 1856), is the standard authority. See INDIA.

DRAWBACK, a term in commerce, employed in connection with the paying back or remitting of duties, whether excise or import, on certain classes of articles. In this country the chief application of the principle of drawback is to imported articles, or those manufactured in part or wholly of imported materials, on which duties have been paid, when such articles are designed for exportation, a drawback being allowed in these cases to the amount of the duties advanced. These duties, of course, enhance by so much the natural price of the commodities on which they are imposed, and were they not remitted, the articles so taxed would not be salable in those foreign countries where articles of the same kind could be purchased free of such duties. Adam Smith, in his *Wealth of Nations*, discussing the propriety of giving drawbacks on excise duties, remarks that, "Such encouragements do not tend to turn towards any particular employment a greater share of the capital of the country than what would go to that employment of its own accord (had no duty been imposed), but only to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally establishes itself among all the various employments of society, but to hinder it being overturned by the duty; they tend not to destroy, but to preserve what it is in most cases advantageous to preserve, the natural division and distribution of labor in society."

Regulations affecting drawback in the United States are to be found in the Revised Statutes. Besides the remission of duties on imported articles to be exported for sale abroad, a drawback is allowed on firearms, agricultural implements, etc., made of

foreign materials with stocks and handles of wood grown in this country, provided the imported materials exceed one-half of the value of the whole material used. Every one entering merchandise for importation or exportation with right of drawback is required to deposit the original invoice of such merchandise with the collector, who causes an inspection to be made by the proper officer and the articles to be compared with their respective invoices before granting the permit for lading. No drawback is allowed on merchandise entitled to debenture under existing laws unless it be exported within three years from the date of importation.

DRAWBRIDGE. See **BRIDGE.**

DRAWER OF A BILL. See **DRAFT, BILL.**

DRAWING is the art of delineating form, as opposed to color and light and shade. The term is not confined to the first outline produced by the pencil or crayon, though this is a narrower sense in which it is also used, and what we commonly mean when we speak of a drawing. In its wider sense, D. is used to describe what is in reality the most important feature of a finished painting of Raphael or Correggio, as well as of an outline by Flaxman or Retzsch. D., in this sense, has been termed the grammar of art. But the analogy is incomplete; for the one quality which is requisite in the application of grammar, is correctness, whereas D., even when correct, even when faultless, admits of degrees of perfection. It may be more or less powerful, more or less free, more or less graceful; and indeed there is no characteristic in which the great artists of the Italian and Flemish schools more unmistakably excell all their successors, than in the power and beauty of their drawing. Neither is there any feature which more unmistakably stamps the individuality of the artist upon the picture.

DRAWING-BOARD, a board on which drawing-paper is strained for painting on in water-colors. The paper is wetted for the purpose of being strained, and, when attached at the edges, it is permitted to dry and contract. Formerly, the drawing board was fitted into a frame, the edges of the wet paper being made fast by the pressure of the frame on the board. But the much simpler drawing-board which is now in use is made of a flat piece or pieces of wood, held together, and prevented from warping, by an edging of other pieces, the grain of which runs in the opposite direction. The wet paper is attached to the edges of the board with paste or thin glue, and when dry, becomes perfectly firm and flat.

DRAWING AND QUARTERING. The English punishment for treason requires that the offender be *drawn* to the place of execution on a hurdle (q.v.); that he be hanged by the neck till he be dead; that his head be severed from his body, and that body be divided into four parts, or *quartered*. The sovereign may, and now certainly would, by a warrant under the sign-manual, countersigned by a principal secretary of state, change the sentence into beheading. In the case of females, the quartering is dispensed with. Stephen's *Commentaries*, iv. 234. See **TREASON.**

DRAWING-ROOM (abbreviated from *withdrawing-room*), the name of an apartment to which persons repair on leaving the dinner-table; hence any room in which company is received. In this sense, the word is in general use in Great Britain, but in the United States "parlor" is usually applied to such an apartment, irrespective of its size. The drawing-room of a sovereign is an assembly at which both ladies and gentlemen appear, in distinction from a levee, to which gentlemen only are admitted. See **LEVEE.**

DRAW-PLATE, a steel plate with a graduated series of holes, through which metals are drawn in making them into wires or bars.

DRAYTON, MICHAEL, was b. in 1563 at Hartshill, in Warwickshire. Of the events of his life but little is known. He is supposed to have studied at the university of Cambridge, and to have been in the army when young. His earliest work, *The Shepherd's Garland*, was published in 1593. He afterwards published the *Barons' Wars; England's Heroical Epistles*, etc. The *Polybion*, the work by which he is best known, appeared in 1613. He was poet-laureate in 1626; he died in 1631, and was buried in Westminster abbey. As a poet, D. is but little known, save to readers like Charles Lamb, who delighted in the obscure corners of literature. His *Polybion* is a topographical poem; and passages from it, now and then met with in county histories and works of an antiquarian character, surprise the readers with their stately rhythm, their nervous force, and their felicity of diction. Vols. I., II., and III. of a complete edition of D.'s works, by the Rev. Richard Hooper, M.A., were published in 1876.

DRAYTON, WILLIAM HENRY, 1742-79; b. S. C.; educated at Oxford, England. In 1771, he was privy councilor of South Carolina; but when the revolution began, he espoused the popular cause, and became a member of the committee of safety. In 1775, he was president of the provincial congress, and the next year was elected chief-justice of South Carolina. He was a prominent member of the continental congress until his death. He left a minute narrative of the current events of the revolution.

DREAMING. In complete sleep, there is probably an entire absence of consciousness of external things. Usually, however, there is a certain amount of mental activity, of which we are more or less conscious at the time, and of which we have more or less subsequent remembrance. This is the state known as dreaming. The chief feature of

this state is "an entire *absence of voluntary control* over the current of thought, so that the principle of *suggestion*—one thought calling up another, according to the laws of association—has unlimited operation."⁵ We seem to perform all the actions of life; we experience every kind of mental emotion, and sometimes our reasoning processes are remarkably clear and complete. Thus, when the mind, during sleep, takes up a train of thought on which it had been previously engaged during the preceding waking hours, intellectual efforts may be made during sleep which would be impossible in the waking state. Such cases, however, are not common. To name two instances (quoted by Dr. Carpenter in his essay on sleep in the *Cyclopædia of Anatomy and Physiology*): Condorcet saw, in his dreams, the final steps of a difficult calculation which had puzzled him during the day; and Condillac states that, when engaged with his *Cours d'Etude*, he frequently developed and finished a subject in his dreams which he had broken off before retiring to rest.

Occasionally, but by no means commonly, dreams seem to possess a remarkable coherence and congruity in reference to the reasoning processes, or the combinations of the imagination. Most of our readers are probably acquainted with the incident narrated by Coleridge of himself, that his fragment entitled *Kubla Khan* was composed during sleep, which had come upon him in his chair whilst reading the following words in Purchas' *Pilgrims*: "Here the khan Kubla commanded a palace to be built, and a stately garden thereunto; and thus ten miles of fertile ground were inclosed within a wall." Coleridge continued for about three hours apparently in a profound sleep, during which he had the most vivid impression that he had composed between 200 and 300 lines. The images, he says, "rose up before him as things, with a parallel production of the correspondent expressions, without any sensations or consciousness of effort." On awakening, he had so distinct a remembrance of the whole, that he seized his pen and wrote down the lines that are still preserved. Unfortunately, he was called away to attend to some business that lasted more than an hour, and on his return to his study, he found, to his intense mortification, that "though he still retained some vague and dim recollection of the general purport of the vision, yet, with the exception of some eight or ten scattered lines and images, all the rest had passed away like the images on the surface of a stream into which a stone had been cast." In other cases, a dream may leave a strong general impression on the mind, although particulars, even immediately on waking, cannot be recalled. Tartini is said to have composed the *Devil's Sonata* under the inspiration of a dream, in which the arch-fiend challenged him to a trial of skill. The dreamer lay entranced by the transcendent performance of his distinguished visitor; but on awakening and seizing his violin, although he was unable to reproduce the actual succession of notes, he produced from his general impressions the celebrated composition which we have named.

Generally, however, dreams are wanting in coherence; all probabilities, and even possibilities of "time, place, and circumstance" are violated. Friends long since dead appear and converse with us; and events long since past rise up before us with all the vividness of real existence. We may be conveyed to the antipodes, or even to worlds beyond our own, without the difficulty of the distance at all standing in the way. We are not aware of the grossest incongruities, probably because we are unable to test the probability of the phenomena by our ordinary experience; hence nothing that we see or do in a dream surprises us. Prof. Wheatstone observes, that "we may walk along the brink of a precipice, or see ourselves doomed to immediate destruction by the weapon of a foe, or the fury of a tempestuous sea, and yet not feel the slightest emotion of fear; though during the perfect activity of the brain we may be naturally disposed to the strong manifestation of this feeling. Again, we may see the most extraordinary object or event without surprise, perform the most ruthless crime without compunction, and see what in our waking-hours would cause us unmitigated grief, without the smallest feeling of sorrow;" and Cicero, who long previously had made D. his study, justly remarks (*De Divinatione*, 59), that if it had been so ordered by nature that we should actually do in sleep all that we dream, every man would have to be bound down on going to bed. Occasionally, however in place of this passive condition, the emotions may be highly excited; thus, for example, the sailor's wife is apt, especially in stormy weather, to dream of shipwreck, and to shriek with terror from its attendant miseries; and those who have once in their lives been exposed to some fearful danger, are apt to have the scene recalled to them in their dreams, either with all its appalling and life-like exactness, or possibly in a grotesque and impossible modification.

Although the predisposing causes of dreams may be sought for in more than one direction, they are probably in general referable to some peculiar condition of the body, and are often called into action through the agency of the external senses. Dr. Gregory relates, that having occasion to apply a bottle of hot water to his feet at bed-time, he dreamed that he was walking up Mt. Etna, and found the ground insufferably hot. Dr. Reid having had a blister applied to his head, dreamed that he was scalped by a party of Indians. M. Gizon de Buzereinges made a series of pre-arranged experiments, with the view of seeing how far he could determine at pleasure the character of his dreams. In his first experiment, having allowed the back of his head to be uncovered during sleep, he thought that he was at a religious ceremony in the open air; the custom of the country in which he lived being to keep the head covered, except on some rare occur-

rences, among which was the performance of religious ceremonies. On waking, he felt cold at the back of the neck, as he frequently had felt when present at the real ceremonies. He repeated the experiment in two days with the same result. In a third experiment, he left his knees uncovered, and dreamed that he was traveling at night in the diligence; and all travelers know, he observes, that it is chiefly at the knees that they feel cold when traveling by that conveyance at night.

One of the most remarkable phenomena of D., is the rapidity with which long trains of thought pass through the mind. A dream requiring hours for its accomplishment, is begun and terminated in a few seconds. A person who was suddenly aroused from sleep by a few drops of water sprinkled in his face, dreamed of the events of an entire life in which happiness and sorrow were mingled, and which finally terminated with an altercation upon the borders of an extensive lake, in which his exasperated companion, after a considerable struggle, succeeded in plunging him. Dr. Abercrombie relates a similar case of a gentleman, who dreamed that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and at last led out for execution. After all the usual preparations, a gun was fired; he awoke with the report, and found that a noise in an adjoining room had both produced the dream and aroused him from sleep. Dr. Carpenter mentions the case of a clergyman falling asleep in his pulpit during the singing of the psalm before the sermon, and awakening with the conviction that he must have slept for at least an hour, and that the congregation must have been waiting for him; but on referring to his psalm-book, he was consoled by finding that his slumber had lasted not longer than during the singing of a single line. Sir Benjamin Brodie, in his *Psychological Inquiries* (1854), mentions the following anecdote of the late lord Holland: "On an occasion when he was much fatigued, while listening to a friend who was reading aloud, he fell asleep and had a dream, the particulars of which it would have occupied him a quarter of an hour or longer to express in writing. After he woke, he found that he remembered the beginning of one sentence, while he actually heard the latter part of the sentence immediately following it, so that probably the whole time during which he had slept, did not occupy more than a few seconds." Many facts of the same kind are on record, and as the author from whom we have quoted, remarks, "were we to pursue this subject, it would lead us to some curious speculations as to our estimate of time, and the difference between the real and the apparent duration of life." It is from cases of this nature that lord Brougham has been led to the opinion, that *all* our dreams really take place in the act of falling asleep or of awaking. We cannot, however, explicitly accept this doctrine. 1. There is no sufficient proof of its being true. 2. We have a proof to the contrary in the fact, that it is common for people to moan and even talk in the middle of a sleep; and every one who has kept a dog must frequently have observed him dreaming (from the outward manifestations which he makes in the form of snarling or growling), though he still remains asleep. Some, on the other hand, have argued that the mind can never be entirely inactive, and that every one is dreaming throughout the whole period of sleep, although the dreams may not be remembered in the waking state. We know of no facts that can be adduced in favor of this hypothesis, and the following case goes strongly to disprove it: A woman, aged 26, who had lost a portion of the scalp, skull, and dura mater, so that a portion of her brain was exposed to view, was a patient in 1821 in the hospital at Montpeller. When she was in a dreamless state, or in profound sleep, her brain was comparatively motionless, and lay completely within its bony case; but when the sleep was imperfect, and the mind was agitated by dreams, her brain moved and protruded from the skull, forming what is termed cerebral hernia. This protrusion was greatest when the dreams, as she reported, were most vivid; and when she was perfectly awake, especially if actively engaged in conversation, it attained its highest development, nor did this protrusion occur in jerks, alternating with recessions, as if caused by arterial action, but remained permanent while the conversation continued. If the *data* of this case are to be depended on, the appearance of the brain during profound sleep seems to indicate that during that state there is a total or nearly total suspension of the mental faculties.

The author of *Psychological Inquiries* suggests the question: Do dreams answer any purpose in the economy of living beings? We regret that he has not given us a very definite answer, but he obviously inclines to the view that they cannot be purposeless. No one has hitherto offered any certain explanation of the uses of the spleen, of the thyroid gland, or of the supra-renal capsules; yet no one believes the formation of these organs to be merely incidental, or doubts that they have some special (although at present unknown) function to perform. "Dreams are," he observes, "at any rate, an exercise of the imagination. We may well conceive that one effect of them may be to increase the activity of that faculty during our waking-hours, and it would be presumptuous to deny that they may not answer some purpose beyond this in the economy of percipient and thinking beings."

Dreams have, in all ages and countries, been believed in as indications of the future; and of all forms of superstition, this is perhaps the most excusable. Whatever is mysterious as to its cause, and beyond the power of the will, appears as supernatural; and what more so than dreams! The thoughts in dreams, too, arise out of the past and present circumstances of the dreamer, and therefore are not altogether without connec-

tion with his future destiny, as most other omens are. In the Homeric age, it was firmly held that "dreams come from Zeus." In the most ancient civilized communities of which we have any record—those of Egypt and Babylon—to interpret the monarch's dreams was one of the most important state offices, and was confided to a college of wise men. A common way of consulting the Greek and Roman oracles (q. v.), was for the inquirer to sleep a night in the temple, after performing sacrificial and other rites, when his questions were supposed to be answered in dreams. Grave philosophers wrote treatises on the interpretation of dreams, as they did on astrology. Even Bacon, although he confesses that the interpretation of dreams is mixed with numerous extravagances, yet speaks as if he thought that something might be made of it. In modern times, and among European nations, dreams are seldom heeded except by the very ignorant or superstitious; and "as idle as a dream" has become a proverb. Nothing can be conceived more arbitrary than the pretended rules of interpretation—e. g., "that to dream of gold is good luck, but of silver, ill." See Brand's *Popular Antiquities*, by Ellis, where a "Dictionary of Dreams" is given. As to the actual coincidences that sometimes happen between dreams and events, it is only surprising, considering the countless fancies that are passing through our minds while asleep, that the coincidences are not ten times more numerous than they are.

DREBBEL, CORNELIS VAN, 1572-1634; a Dutch inventor of whose life little is known. He seems to have been a favorite at court, and tutor to the son of Ferdinand II. In the thirty years' war he was arrested and saved from execution only through interference of James I. of England. After 1620, he resided in London, where, it is said, he invented the compound microscope and an air thermometer with its bulb filled with water. It was reported also that he showed the king a glass globe in which, by means of the four elements, he had produced perpetual motion; and that by means of other machinery he imitated lightning, thunder, rain, and cold, and was able to speedily exhaust a river or lake. He made some discoveries in dyes, which were used by the founders of the Gobelins manufactures.

DREDGE, a machine for dragging or dredging the bottom of seas, rivers, or lakes, in order to bring up oysters and other animals that lie on the bottom. The common oyster-dredge is a bag-net, made of iron rings, linked together to form the meshes; the mouth is made of sheet-iron, which acts as a scoop when the dredge is let down and drawn along the bottom as the boat sails on. The dredge has of late been very extensively used by the naturalist with very important results, among the most remarkable of which are those obtained by the *Challenger* expedition, showing the existence of animal life in great variety at depths where it had before been considered impossible. The ordinary naturalist's dredge is of a lighter construction than that of the oyster-fisher, and its meshes should be smaller. For dredging a sandy bottom, the best form of dredge is one like the net used by the Kentish shrimpers. These are twine nets, bag-shaped, and of the length of the boat. The lower side of the mouth of the net is stretched upon a wooden pole, and the other side is held up while the lower is drawn along the bottom. The quantity and variety of animals drawn up by these nets are astonishing. The dredge used for soles resembles the shrimp-net; but all dredges must be modified to suit the bottom on which they are used.

Naturalists generally employ an instrument constructed on the general plan of an oyster-dredge for obtaining specimens of animals living at the bottom of the sea, to determine their structure and geographical distribution. In working, the dredge is slipped gently over the side of the boat, either from the bow or the stern. When it reaches the bottom and begins to scrape, an experienced hand upon the rope can usually detect by the tremor of the line when the dredge is passing over an irregular surface. The boat should move not more than a mile in an hour. The dredge may remain down from 15 to 20 minutes, within which time, in favorable circumstances, it may be fairly filled. It comes up variously freighted, according to the locality, and the contents are examined. The scientific value of dredging depends mainly upon two things: the care with which objects procured are preserved and labeled for future identification, and the accuracy with which all the circumstances of the dredging—the position, the depth, the nature of the ground, the date, temperature, etc.—are recorded.

Until the middle of the 18th c. the little that was known of the inhabitants of the sea beyond low-water mark seems to have been gathered almost entirely from objects thrown on the beach after storms, and from the chance captures of fishermen. The dredge was used to aid natural history, first by Otto Frederick Müller, in the researches which furnished material for his *Descriptions and History of the rarer and less known Animals of Denmark and Norway*, 1779. Thenceforward much advance was made in knowledge of deep-sea life, mainly by the efforts of the British association; but the first important undertaking was in the winter of 1872. At that time *The Challenger*, a steam-corvette of 2,306 tons, and 1234 horse-power, was sent out to investigate the physical and biological conditions of the great ocean basins. This vessel was thoroughly equipped, and carried a corps of distinguished scientists. Dredging was done from the main yard-arm. A strong pendant was attached by a hook to the cap of the main-mast, and, by a tackle to the yard-arm, a compound arrangement of 55 to 70 of Hodge's patent accumulators was hung to the pendant, and beneath it a block through

which the dredging-rope passed. The donkey-engines for hauling in the dredging and sounding gear were placed at the foot of the main-mast on the port side. They consisted of a pair of direct-acting high-pressure horizontal engines, in combination of 18-horse power nominal. Instead of a connecting rod to each, a guide was fixed to the end of the piston-rod, with a brass block working up and down the slot of the guide. The crank axles ran through the center of the blocks, and the movable block, obtaining a backward and forward motion from the piston-rod, acting on the crank as a connecting rod would do. This style of engine is commonly used for pumping, the pump-rods being attached to the guide on the opposite side from the piston-rod. At one end of the crank a small-toothed wheel was attached, which drove one thrice the multiple on a horizontal shaft extending nearly across the deck, and about 3 ft. and 6 in. above it. At each end of this shaft a large and small drum were fixed, the larger having three sheaves cast upon it of different sizes; the small being a common barrel only. To these drums the line was led, two or three turns being taken round the drum selected. In hauling in, the dredging-rope was taken to a gin-block secured to a spar on the fore-castle, then aft to the drum of the donkey-engine on the port side, then to a leading-block on the port side of the quarter-deck, and across the deck to a leading-block on the starboard side corresponding in diameter with the drum used on the port side, and from this it was finally taken by the hands and coiled. The strain is of course greatest at the yard-arm and the first leading-block, and by this arrangement it is gradually diminished as the line passes round the series of blocks and sheaves. A change made latterly in the handling of the dredge had certain advantages. Instead of attaching the weights directly to the dredge-rope, and sending them down with the dredge, a "toggle," a small spindle-shaped piece of hard wood, was attached transversely to a rope at the required distance, 200 to 300 fathoms in advance of the dredge. A "messenger," consisting of a figure of eight of rope, with two large thimbles in the loops, had one of its thimbles slipped over the chain before the dredge was hung, and the other thimble made fast to a lizard. When the dredge was well down and had taken its direction from the drift of the ship, the weights, usually six 28-lb. deep-sea leads in three canvas covers, were attached to the other thimble of the traveler, which was then cut adrift from the lizard and allowed to spin down the line until it was brought up by the toggle. By this plan the dredge took a somewhat longer time to go down; but after it was adopted not a single case occurred of the fouling of the dredge in the dredge-rope, a misadventure which had occurred more than once before, and which was attributed to the weights getting ahead of the dredge in going down, and pulling it down upon them entangled in the double part of the line.

The great risk in dredging in very deep water is that of the dredge running down nearly vertically and sinking at once into the soft mud, and remaining imbedded until hauling in commences. During the earlier part of the voyage of the *Challenger* this accident frequently defeated, at least partially, the object of the operation; and, after various suggestions for modifying the dredge, it was proposed to try some form of the trawl in order to insure, so far as possible, the capture of any of the larger marine animals which might be present, and thus to gain a better general idea of the nature of the fauna. A 15-ft. beam-trawl was sent down off cape St. Vincent to a depth of 600 fathoms; the experiment looked hazardous, but the trawl duly came up, and contained, with many of the larger invertebrata, several fishes. The trawl seemed to answer so well that it was tried again a little further s. in 1090 fathoms, and again it was perfectly successful; and during the remainder of the voyage it was employed almost as frequently, and in nearly as deep water (3,125 fathoms in the Pacific), as Ball's dredge was in the Atlantic, where the deepest haul was at 3,150 fathoms. During the voyage of the *Challenger*, a course of about 70,000 nautical miles was traversed in three years and a half, and 362 observing stations were established at intervals as nearly uniform as circumstances would permit; and at the greater number of these, dredging or some modification of the process was successfully performed—52 times at a depth greater than 2,000 fathoms, and thrice at depths beyond 3,000 fathoms. So fully convinced were the *Challenger* officers that they could dredge at any depth, that it was only want of time and daylight which prevented their doing so at their deepest sounding, 4,575 fathoms. The Atlantic was crossed five times, and an erratic route through the Pacific gave a good idea of the conditions of the abysses of that ocean, while in the s. Indian ocean dredging and trawling were carried down close to the Antarctic ice-barrier.

The results of this expedition were of the most interesting nature. Animal life was found to exist at all depths, although probably in diminishing abundance as the depth becomes extreme; and in various parts of the world at depths beyond 400 or 500 fathoms the fauna had much the same general character. The species usually differed in widely separated areas, but the great majority of forms, if not identical, were so nearly allied that they might be regarded as representative and genetically related. Although all marine invertebrate classes were represented, echinoderms in their different orders, sponges and crustacea preponderated, while corals and mollusca were comparatively scarce. In the two groups first named, many forms occurred allied to families which had been previously regarded as extinct or nearly so; thus among the echinoderms, stalked crinoids were by no means rare, and many species of regular *echinidea* related to the chalk genus *echinothuria*, and many irregular species allied to *ananchytes* and *dysaster*,

occurred. The sponges were mainly represented by the *hexactinellida*, the beautiful order to which the glass-rope sponge of Japan and the marvelous "Venus's flower-basket" of the Philippines belong, the order to which the ventriculites of the chalk must also be referred. See SOUNDING, DEEP SEA.

Dredging at its greatest depth is a difficult and critical operation, and although by its means some idea of the nature and distribution of the abyssal fauna of the ocean has already been attained, it will be long before the blanks are filled up; for of the area of 140,000,000 sq.m. forming the "abyssal province," the actual amount hitherto traversed by the naturalist's dredge may still be readily reckoned by the square yard. See *illus.*, DIVING APPARATUS, vol. V., 1; WATER STORAGE, vol. XV.

DREDGING-MACHINE, a machine used for clearing out or deepening the channels of rivers, harbors, etc. Dredging-machines are variously constructed, the simplest being like the oyster-dredge described above, only having a perforated cowhide bag instead of the chain-net, and a stronger "spoon" or iron mouth to the bag. This is attached to the end of a pole, and worked with tackle by men from a barge in such a manner that the loose matter of the bottom is scooped up into the barge. The bucket dredging-machine is much more efficient. It consists of a long stage or framework overhanging the side of the barge. This frame has a wheel at each end, upon which works a powerful endless chain, to which is attached a series of perforated iron buckets, each with a shovel-shaped steel mouth projecting considerably on one side. The overhanging framework forms an inclined plane, along which the buckets run, descending on one side, and ascending on the other. They are so arranged that they descend empty, and on reaching the bottom, the projecting shovel or scoop-mouth digs into the bottom, and partially fills the bucket with the silt; it then turns round on the wheel at the lower end of the incline, and runs up it till near the top, when it turns over the upper end, and in doing so its contents are emptied into a second attendant barge. This action is continued by every succeeding bucket of the endless chain. The perforations are for the passage of the water. By varying the inclination of the framework, the working depth may be increased or diminished. Some dredgers are fitted with two complete sets of buckets, one on each side of the vessel. A steam-engine and boiler, suitably placed in the dredger, are provided for giving motion to the machinery, and sometimes also to a screw-propeller placed at the stern.

DRED SCOTT CASE. One of the most famous cases ever passed upon by the Supreme Court of the United States. Dred Scott was a Missouri slave whose master in 1834 took him to Illinois, a state which prohibited slavery by statute. In Illinois, Dred Scott married and remained by his master's consent until 1838, when he was taken to Minnesota, a territory in which slavery was expressly prohibited by the act of Congress (1820), commonly known as the Missouri Compromise (q.v.). From Minnesota, his owner took him back to Missouri, and there for some offense whipped him. Dred Scott brought suit against his master for damages, claiming that, by reason of his residence in Illinois and Minnesota, he had become a free man. The master, on the other hand, denied that Dred Scott could sue, inasmuch as he was descended from slave ancestors and had himself never been set free. The case was decided in favor of Dred Scott by the Circuit Court of the State of Missouri, and was appealed by the master to the Supreme Court of the United States.

The decision of this tribunal was rendered in 1857. It declared that the ancestors of negro slaves were not regarded by the founders of the government as persons at all, but as chattels, mere things "who had no rights and privileges but such as those who held the power and the government might choose to grant them;" that Dred Scott was necessarily, therefore, not a citizen but a *thing*, and hence could have no standing in the court; and finally that his residence in Minnesota could not confer freedom upon him, because the act of Congress of 1820 was unconstitutional and void. The court then went on to say that Congress had no more right to prohibit the carrying of slaves into any state or territory than it had to prohibit the carrying thither of horses or any other property, for slaves were property whose secure possession was guaranteed by the Constitution. This was the decision of the majority of the court, consisting of Justices Taney (the chief-justice), Grier, Nelson, Catron, Daniel, Campbell, and Wayne; Justices McLean and Curtis dissenting.

DREIBUND. See TRIPLE ALLIANCE.

DREIS'ENA, a genus of lamellibranchiate mollusks, generally regarded as belonging to the mussel family (*mytilide*), although, whilst the shell very much resembles that of the true mussels, the animal differs in having the mantle closed except at the anal and branchial slits, and a small aperture through which the foot and byssus protrude.—*D. polymorpha* is an interesting mollusk, because, having of late been accidentally introduced into British estuaries and canals, it has fully established itself, and is now abundant in many of them, and in the rivers with which they are connected. Originally, it is believed, a native of the rivers which flow into the Caspian sea and lake Aral, it has extended to the canals and rivers of Germany, Holland, etc. It is capable of living a long time out of water with its valves closed, and it is supposed that it may have come to Britain on timber imported from the continent.

DRELICOURT, CHARLES, 1595-1669; a French Calvinistic minister at Langres, 1618. In 1620, he went to Paris, and was made minister of the church at Charenton. He wrote a large number of devotional works, which had a wide circulation. His

Catechism, and *Consolations against the Fear of Death*, became well known in England. His controversial works were also numerous, and did much to consolidate the Protestant party of France. A number of his sons were distinguished as theologians or physicians.

DRENTHE, a frontier province of the Netherlands, is bounded on the e. by Hanover, on the n. and e. by Groningen, on the w. by Friesland, and on the w. and s. by Overijssel, in lat. $52^{\circ} 37'$ to $53^{\circ} 23'$ n., and long. $6^{\circ} 12'$ to $7^{\circ} 10'$ east. Area, 1030 sq. miles. Pop. '95, 141,225. The soil is in general poor, only about one half of the surface being capable of cultivation, the remaining portion covered chiefly with heath and morass. The principal crops are rye and buckwheat, but barley and oats are also raised. The inhabitants are chiefly employed in agriculture, pasturage—the cattle reared in D. being famous—and in digging and exporting peat. Two pauper colonies in the w. of the province, the Fredericksoord and Willemsoord, established in 1818, are employed by the state in bringing waste land under cultivation, and in brick-making, weaving, and other occupations.

DRESDEN, the capital of the kingdom of Saxony, situated in a charming valley on both sides of the Elbe, in lat. $51^{\circ} 3' 16''$ n., and long. $13^{\circ} 44'$ east. It is 116 m. e. of Berlin, and 72 m. e.s.e. of Leipsic. It is composed of the Altstadt (Old Town), on the left bank of the Elbe; and of the Neustadt (New Town), on the right or northern bank. D. is a pleasant, though not exactly a beautiful town. It contains several open squares both in Old and the New towns. Pop. '95, 334,066. On account of its architecture and splendid collections in art, it has been justly called the "German Florence." Of the churches, the finest are the Frauenkirche, with a tower 335 ft. in height; the Roman Catholic church (1737-56), with a celebrated organ by Silbermann, and numerous statues and pictures; the Sophienkirche; and the Kreuzkirche, with an altar-piece by Schönau. The synagogue of the Jews, built in the oriental style by Semper, is also worthy of mention. Among the other important buildings may be mentioned the royal palace, a shapeless edifice, begun by duke George, 1534, and completed by Augustus II.; the prince's palace, erected by Augustus II. in 1718; the Zwinger, only the vestibule of a palace in the almost too elaborate old French style of architecture, but containing many valuable antiquarian and scientific collections; the theater, the academy, the Brühl palace, etc. The Old and New towns are connected by two bridges, both *chefs-d'œuvre* of architecture.

D. possesses many excellent educational and charitable institutions. The academy of art opened in 1764, to which a school of architecture was added in 1819. This celebrated institution and the musical choir render D. of no small importance to the progress of art in the present day.

The most important branches of industry are gold and silver manufactures, machinery, straw-plait, paper-hangings, excellent painters' canvas, colors, artificial flowers, chocolate, porcelain, etc. An impulse was given to the corn-trade by the opening of the corn exchange in 1850.—The environs of D. are delightful.

The most important of the D. collections are: 1. The royal public library in the Japan palace, amounting to over 400,000 volumes. It contains many curiosities, and is particularly complete in the departments of literary history and classical antiquity, as well as in histories of France and Germany. 2. The cabinet of coins, likewise in the Japan palace. 3. The museum of natural history in the Zwinger, particularly complete in the mineralogical department. 4. The historical museum, formed in 1833. 5. The collection of mathematical and physical instruments, likewise in the Zwinger. 6. The renowned picture-gallery, containing upwards of 1500 paintings, mainly by Italian and Flemish masters. Among the former, those especially worthy of notice are the pictures of Raphael ("The Sistine Madonna"); of Correggio ("La Notte," and the "Madonna of St. Sebastian"); of Titian ("The Tribute-money," and "The Venus"); of Andrea del Sarto ("Abraham's Sacrifice"); of Francia; of Paul Veronese; of Giulio Romano ("The Virgin with the Pitcher"); of Leonardo da Vinci ("Francesco Sforza"); of Garofalo, Bellino, Pietro Perugino, Annibale Caracci, Guido Reni, Carlo Dolce, Cignani, etc. Of the Flemish school, the collection boasts 41 pictures by Rubens, 21 by Vandyck, many by Rembrandt, admirable specimens of Snijders, Johann Breughel, Ruysdael, Wouvermann, Gerard Dow, Teniers, etc. Of works of the German school, the gem of the collection is Hans Holbein's Madonna. Of the French school, several pictures by Nicolas Poussin, and some admirable landscapes by Claude Lorraine, are the most remarkable. 7. The cabinet of engravings in the Zwinger is arranged in twelve classes, marking distinct periods in the history of art. 8. The collection of antiques in the Japan palace, including several admirable sculptures. 9. The "green vault" in the royal palace, a valuable collection of precious stones, pearls, and articles wrought in gold, silver, and ivory. 10. The collection of porcelain in the Japan palace.

D. is known in history as far back as the year 1206. It is officially mentioned as a town in 1216. Henry the illustrious selected it for his capital in 1270. From the close of the 15th c., its prosperity gradually increased. Several successive sovereigns contributed to its embellishment, particularly Augustus I. and Augustus II. It suffered severely, however, during the seven years' war; and again in 1813, when Napoleon selected it as the central point of his operations. During the revolution of 1849, also, immense damage was inflicted upon the town, but it is again rapidly improving. D.

was occupied by the Prussians in 1866 during the Austro-Prussian war. Since that year the city has been enlarged and made more delightful. New streets have been opened; old irregular buildings have given way to handsome and imposing edifices. The foundation stone of the magnificent new Court Theatre was laid in 1871.

DRESDEN, BATTLE OF. In Aug., 1813, when the war between Napoleon and the allies, after a short truce, broke out afresh, the armies of the latter gathered from all sides towards Dresden, which they regarded as the key of the French position. It was held by St. Cyr with a force of about 30,000 men, the main body of the French under Napoleon being in Silesia, where the emperor expected the contest was to be waged. On the 23d, the grand army of the allies appeared before Dresden. The town would in all probability have been quickly stormed, had not Schwarzenberg and the Austrians insisted on waiting the arrival of the left wing under Klenau. This delay saved the French, for at half-past 9, on the morning of the 26th, Napoleon with his guards entered the town. At 4 o'clock in the afternoon, Schwarzenberg, the commander-in-chief of the allies, gave orders for the attack. At various points, the assault was irresistible, but the opportune arrival of the "young guard" enabled Napoleon to hazard a sally, which was as unexpected as it was successful. The allies fell back everywhere; but not dispirited, renewed the fight next day. Towards noon, Moreau was mortally wounded by a cannon-ball at Alexander's side on the height of Räcknitz, and Napoleon obtained a decided advantage over the left wing of the allied army, which Murat, by a skillful maneuver, contrived to outflank, taking 10,000 prisoners, among whom was Gen. Metsko. Several other successes in other parts of the field determined the allied armies, especially after hearing that Vandamme was advancing towards Pirne, to retreat, which they did during the night of the 27th Aug. Dresden, however, was not yet delivered from the miseries of war. When Napoleon finally quitted the city on the 7th Oct., nearly 30,000 men still remained behind. As all access was cut off by the Russians, the city suffered severely from famine. A capitulation was at length brought about (11th Nov., 1813) between St. Cyr and Klenau, according to which the garrison were to withdraw unmolested from the 12th to the 16th Nov., on condition that they laid down their arms. The capitulation was nevertheless rejected by prince Schwarzenberg, the garrison declared prisoners of war, and treated as such. The battle of Dresden, as Alison observes, was the *last* pitched battle, on a scale commensurate with his former victories, that Napoleon ever gained.

DRESS, the collective name for the artificial coverings worn in greater or less quantity by all but the most savage of the human race, and always combining the two objects of warmth and ornament. It seems, indeed, from what we read of savage nations, that it is rather in the desire for ornament that the wearing of dress begins, than with a view to protection from cold (see **FASHION**, under which head some notice will be given of the more singular caprices to which the forms of dress have been subjected; see also **CRINOLINE**, **BLOOMERISM**). The earliest coverings would consist of such articles as the skins of animals, and the leaves and inner bark of plants, which, as civilization advances, are mostly supplanted by various textures of wool, flax, silk, and other vegetable and animal substances. Some account of these textures is given under the appropriate heads, and the regulation of dress with a view to health is treated under **SANITARY SCIENCE**. As will be shown more fully under **FASHION**, the tendency in modes of dress—notwithstanding occasional aberrations—is towards simplicity and appropriateness.

DRESSINGS, in architecture, is a term loosely used to signify moldings and all the simpler kinds of sculptured decorations.

DREUX, an ancient t. of France, in the department of Eure-et-Loir, is situated on the river Blaise, 22 m. n.w. of Chartres, and 45 m. w. of Paris. It is tolerably well built, and lies at the foot of a hill crowned with the dilapidated ruins of an ancient castle, formerly the possession of the comtes de Dreux. From among the ruins rises a beautiful chapel, in the form of a Greek temple, surmounted by a cupola, erected by Louis Philippe. It contains the tombs of two of the children of Louis Philippe, and of others of his relations. The town-hall and the parish church, both handsome specimens of Gothic, are the only other buildings worthy of note. D. has extensive manufactures of coarse cloth, serge, etc., with a trade in sheep and cattle, also various tan-yards, iron-foundries, and dye-houses. Pop. of commune, '91, 9364. In 1562 one of the bloodiest battles recorded in the religious wars of France took place at D., in which the Catholics, under the constable Montmorency, defeated the Huguenots, and took their leader, the prince of Condé, prisoner.

DREW, a co. in s. e. Arkansas, on Bartholomew bayou and the head waters of Saline river; area recently diminished to form another co.; 802 sq.m.; pop. '90, 17,302. It is level and fertile, much of it covered with cypress and ash forests. Productions: corn, cotton, etc. Co. seat, Monticello.

DREW, DANIEL, 1797-1879; b. N. Y. He began life as a drover and dealer in cattle; soon went into the steamboat business, and afterwards into railroads, and became known as one of the boldest and sharpest speculators in stocks, winning and losing several fortunes. He was always interested in the prosperity of the Methodist Episcopal church, and in proof of that interest founded the Drew ladies' seminary, at Carmel,

N. Y. (his native town), and the Drew theological seminary, at Madison, N. J. Not long before his death he lost his estate.

DREW FAMILY, THE, remarkable in the annals of the American stage. Its best-known members are (1) JOHN DREW, SR., b. in Ireland, Sept. 3, 1825; came to America, where he made his first appearance at the Bowery Theatre, N. Y., in 1845. From 1845 to 1855 he played in the principal American cities; visited England in 1855, Australia in 1859, and died in 1862. (2) MRS. JOHN DREW (Louisa Lane), the daughter of a London actor, b. in London in 1820; came to America in 1827, and appeared in child parts in 1828. Five years later she acted the parts of "Julia," in *The Hunchback*, and "Lady Teazle," in *The School for Scandal*. She was married three times—her third husband being Mr. John Drew. In 1882 she first took the part of "Mrs. Malaprop" in *The Rivals*, her greatest success. She managed and largely owned the Arch St. Theatre in Philadelphia. (3) JOHN DREW, son of the preceding, b. in Philadelphia in 1853. He early appeared upon the stage, and has won remarkable success as the *jeune premier* of Mr. Augustin Daly's company. (4) GEORGIE DREW (Barrymore), sister of the preceding, b. about 1858, married to Maurice Barrymore the actor, and herself an actress of much vivacity and talent. She died in 1893.

DREW THEOLOGICAL SEMINARY, for the education of ministers of the Methodist Episcopal church, was founded at Madison, N. J., in 1866, by Daniel Drew, a New York capitalist, who gave about \$500,000 to the institution. It was organized under the supervision of the Rev. Dr. John McClintock, its first president. The institution is handsomely located within one hour of New York city, in an extensive park, with superior library building, dormitories, and residences for the faculty. In 1897 it had 6 professors and 133 students; president, Henry A. Buttz, D.D.

DREYSE, JOHANN NIKOLAUS VON, 1787-1867; a native of Saxony, inventor of the needle-gun. He was the son of a locksmith, and followed the business, adding the manufacturing of tools. In 1836, he completed his invention of the needle-gun, which arm was a few years afterwards supplied to all the German troops. He and his family were ennobled in 1864.

DRIFT, a name given to the boulder-clay, a deposit of the pleistocene epoch. More fully, it is called the northern drift, glacial drift, or diluvial drift, in allusion to its supposed origin. For an account of the formation, see BOULDER-CLAY.

DRIFT-WOOD is wood carried by tides and currents to a distance from its native locality. Specimens thus transported have been observed in the marine strata of the chalk, London clay, and other formations.

SAND-DRIFT is sand driven and accumulated by the wind. Deposits thus formed are occasionally found among the stratified rocks, but compared with other strata they are few, though, from their anomalous character, an acquaintance with their phenomena is of importance to the geologist. Moving sands are at the present day, in many places, altering the surface of the land. In the interior of great dry continents, as Africa, India, and Australia, extensive districts are covered with moving sands. The continuous blowing of a steady wind in one direction often covers a rich tract with this arid material. But the influence of the wind on loose sand is most evident along low sandy coasts, where hills, called "dunes," are formed entirely of it; they sometimes attain a considerable height, as much, for instance, as 200 or 300 feet. Dunes are advancing on the French coasts of the bay of Biscay at the rate of about 60 ft. per annum, covering houses and farms in their progress. Similar accumulations are forming on the coasts of Nairn, Cornwall, Wexford, and other parts of the British isles. The Culbin sands, in Nairnshire, cover a large district which at a period not very distant was rich arable land. The prevailing wind is from the w., hence the hills are slowly moving in an easterly direction, at the rate of a mile in somewhat less than a hundred years. A singular stratification exists in these hills. The prevailing w. wind lifts, or rather rolls the particles of sand up the gentle incline of the western aspect of the hill, until they reach the summit, where they fall, forming a steep declivity to the e., equal to the angle of repose for sand. A shower consolidates the surface of the new bed, or a land-breeze carrying the fine dust separates it by a very thin layer of finer material from the one that follows, and thus, as the hill moves eastward, a regular series of strata is formed at a very high angle. Little can be done to arrest the progress of these devastating sand-drifts. It has been recommended to plant *carex arenaria* and similar sand-loving plants, which have long creeping roots: they certainly check to a considerable extent the influence of the wind.

DRILL, *Cynocephalus leucophæus*, a species of baboon (q.v.), a native of Guinea, similar to the mandrill, but rather smaller and less ferocious.

DRILL is a general name for the exercises through which soldiers and sailors are passed, to qualify them for their duties. It is subject to numerous varieties, according to the number and organization of the men drilled at one time, and the kind of weapon to which the exercises relate. The infantry, the cavalry, and the artillery, all have different kinds of drill. The militia and the volunteers differ from the regulars, if not in the kind of D., at least in the circumstances under which it is carried on; the squad-drill, company-drill, and battalion-drill, vary both in the numbers concerned and in the routine of exercises. And so likewise in the navy, the drilling of seamen varies in kind, according to the duties likely to be required. See MANUAL, TACTICS.

Manuals of D. have been prepared for all the various branches of the two services. Drill-halls, in which D. can be carried on comfortably in any kind of weather, are now common.

DRILL, a fine linen fabric of a satiny finish, used for summer dress for gentlemen. Drills are worked with five shafts, except fancy patterns, which are wrought with eight shafts.

DRILLING—DRILL. Drilling is the name applied to the mode of sowing in regular rows, as distinguished from broadcast sowing, and the drill is the name of the implement employed in this process; the term *drill* is also frequently applied to a row of drilled crop, as a drill of potatoes, corn, or turnips. In all countries in which maize and Indian corn are grown, the principle of drilling has been long known and acted upon. In gardening it has been practiced everywhere from time immemorial; but its extension to field-culture is comparatively of recent date. Jethro Tull invented a drilling-machine in the early part of last century, and did much to show its merits in the culture of grain and root crops. Since his time, the use of this implement, in the case of both white and green crops, has in many districts become general. The crops which are now most generally drilled, are clover, flax, cereals, beans, pease, potatoes, turnips, beet-root, cole-seed, and carrots. Of these, clover and flax are sown in drills at about 3 or 4 in. apart; cereals from 6 to 12 in.; and beans, potatoes, and turnips at from 25 to 30 in. apart; the general rule, however, with most green crops, being that the space between the rows should admit of the passage of a light plow or hoe, drawn by a horse, without danger to the plants. A great variety of drills are now in use. The system of lifting the grain in small cups and conveying it to the coulter has been long in use. Garrett of Saxmundham, Suffolk, and Hornsby of Grantham, are favorite makers of corn and turnip drills. Latterly, R. Reid & Co. of Aberdeen have acquired fame with their patent disk corn-drill, which is popular in Scotland and some parts of England. One powerful recommendation of drilling is, that by means of it a considerable saving of seed is effected in the sowing of white crops; but the great advantage is, that in the case of green crops, it enables the farmer more readily to clean the land, both by the hand and by the horse hoe. About one-half the seed suffices when deposited by the drill-machine, compared with what the hand-sowing requires, and the seed is more regularly spread and better covered. The braid comes up more uniformly, and the straw is stronger and stiffer. Drill-sowing is slow work, but it is so efficient that it is gaining on the broad-cast. To keep the soil stirred and pulverized, which can only be properly done where the crops have been drilled, favors the retention and absorption of the moisture.

In England, turnips are sometimes drilled by a machine on the flat; while in Scotland, they are always sown on ridges or drills formed by the double-molded plow. The double-board or drill plow is to be found now on almost every farm, and its introduction has saved much labor. Turnip-sowing machines which take two drills at the time have been common for years, and potato-planters taking two rows at the stripe are being introduced, but have not been established yet. One of these was tried, with interest and success, at the Royal English Show, held at Hull, in 1873.

DRILLS are tools used for boring or drilling holes in metal, bone, ivory, hard woods, etc. They are usually made of a square steel bar, flattened out at the cutting end; this part is brought to an angular point like a spear-head, and the cutting edges forming the angle are beveled in opposite directions. Those which have a projecting pin in the center, and chisel-shaped cutting edges on each side of the pin, are called "center bits." There are various contrivances by which the drills are made to revolve. For drilling iron, steel, and large brass work, the lathe is commonly used, the drill being fitted into a square-hole chuck, and the work pressed against it while revolving by the screw and center of the puppet. The *brace or drill-stock* is commonly used by carpenters for center bits, and occasionally for metal work. This is a curved handle, which is made to revolve by the hand, while one end is pressed against the chest. The best and most generally used drills for small boring are called twist drills, which have many advantages over the flat drills described above. Twist drills are made from steel rods of uniform diameter through their length. Upon the rod two spiral grooves are cut, each starting at the cutting edge at diametrically opposite points. At the end of the drill the grooves almost meet in the center of the rod, but grow shallower as they continue. The cutting edges are ground on the end of the rod and the borings escape through the grooves, which constantly carry them away from the cutting edge, thus preventing clogging.

DRIMYS. See WINTER'S BARK.

DRINKING USAGES. Some of these are of great antiquity, and all are interesting in connection with the history of manners. Besides sacrifices of animals and articles of food, the Hebrews made drink-offerings a solemn religious service. To mark the spot where he communed with God, Jacob set up a pillar of stone, and "poured a drink-offering thereon."—Gen. xxxv. 14. We learn that such sacrifices were not made alone to the true God; for women are said to have poured out "drink-offerings unto other gods."—Jer. vii. 18. Such a statement is amply verified by pagan writers. Among the Greeks and Romans, the pouring out of a libation to the gods was a common religious observance. A libation was made on the occasion of solemn prayers, and also

before meals. These libations were usually of undiluted wine, but they were also sometimes of milk diluted with water, or water flavored with honey. There are many references to these libations by Sophocles, Æschylus, Pliny, and other writers. The libation at meals consisted of pouring a small quantity of liquor from the cup on the ground—so much waste being a kind of propitiation, or an act somewhat equivalent to the asking of a blessing. See SACRIFICE.

From these and similar usages in remote times sprung the ceremonial observance of drinking healths, or the uttering of a pious, heroic, or friendly sentiment before quaffing liquor on festive occasions. It has been stated that the practice of saying, or pledging "I pledge you," originated in England in the 10th c., it being then necessary for one to watch over the safety of his companion when the cup was at his lips. But the custom of drinking healths, as just mentioned, is of far higher antiquity, and was derived immediately from the boisterous convivialities of a Scandinavian and Teutonic ancestry (see *WALHALLA*), if not with equal likelihood from the usages of the early Britons, who were of Celtic origin. A story is told of a feast given by Hengist (5th c.) at his stronghold of Thong-caster, in Lincolnshire, to the British king Vortigern, and of the bewitchment of the royal guest by the charms of Rowena, the young and beautiful daughter of his entertainer. Rowena's address, as she gracefully knelt and presented the wine-cup to the king, *Liever kyning, wass heal*, or, "Dear king, your health," is often quoted as the origin of our still existing expressions, wassail and wassail-cup; though wassail means pledging or health-drinking independently of the saying of Rowena, and certainly was not then uttered for the first time. Wassail is derived from the old Anglo-Saxon *Wes heil*, "Be in health;" and *Wes heil* and *Drinc heil* were the usual ancient phrases in quaffing among the English, and synonymous with "Here is to you," and "I'll pledge you," of later times. The explanation of wassail by an old writer, Robert de Brunne, may be appropriately quoted:

"This is ther custom and her gest
When thei are at the ale or fest,
Ik man that levis qware him think
Salle say *Wosseille*, and to him drink.
He that biddis salle say, *Wassaile*,
The tother salle say again, *Drinkaile*.
That says *Wosseille* drinks of the cop,
Kissand his felaw he gives it up."

The learned Selden, in a note on the *Polyolbion*, says: "I see a custom in some parts among us; I mean the yearly was-haile in the country on the vigil of the new year, which I conjecture was a usual ceremony among the Saxons before Hengist, as a note of health-wishing (and so perhaps you might make it wish-heil), which was exprest among other nations in that form of drinking to the health of their mistresses and friends. 'Bene vos, bene nos, bene te, bene me, bene nostram etiam Stephanium,' in Plautus, and infinite other testimonies of that nature in him, Martial, Ovid, Horace, and such more agreeing nearly with the fashion now used: we calling it a health, as they did also in direct terms." For further particulars concerning wassail and wassail-bowl, we may refer to Brand's *Popular Antiquities*, edited by Ellis. It is enough here to quote from that authority the following passages: "Milner on an ancient cup (*Archæologia*, xi. 420), informs us that 'the introduction of Christianity amongst our ancestors did not at all contribute to the abolition of the practice of wasselling. On the contrary, it began to assume a kind of religious aspect, and the wassel-bowl itself, which in the great monasteries was placed on the abbot's table, at the upper end of the refectory or eating-hall, to be circulated amongst the community at discretion, received the honorable appellation of "poculum charitatis." This, in our universities, is called the grace-cup.' The poculum charitatis is well translated by the toast-master of most of the public companies of the city of London by the words a 'loving cup.' After dinner, the master and wardens 'drink to their visitors, in a loving cup, and bid them all heartily welcome.' The cup [a silver flagon containing warm spiced wine] then circulates round the table, the person who pledges standing up whilst his neighbor drinks to him."

While the drinking of healths is thus of old date, the application of the word "toast" is modern, having had its origin in the practice of putting a piece of toasted bread in a jug of ale, hence called "a toast and tankard." The custom of so using the word is said to have had its rise at Bath, in the reign of Charles II. It happened that on a public day a celebrated beauty of those times was in the cross [or large public] bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow half-tipsy, who offered to jump in, and declared, though he liked not the liquor, he would have the toast. He was opposed in his resolution; yet this whim gave foundation to the present honor which is done to the lady we mention in our liquors, who has ever since been called a toast.—*Tatler*. Begun in the form of toasting beauties at private parties, toasts were in time given on all sorts of subjects at public festivities, accompanied with rounds of cheers and hurrahs, these noisy demonstrations being now called "the honors." The fatigue of announcing these exciting sentiments is so great, that in all well-ordered large assemblies a toast-master is employed. Standing behind the chairman, this official, besides proclaiming the toasts, acts as a fugleman to regu-

late the clapping of hands and the "hip, hip, hurrahs" of the company. "Toasts, certainly, in this guise look more like a medium for taking an indefinite quantity of wine, than that spontaneous effusion of the heart in honor of some cherished individual, which they originally were. On certain occasions, these signals are hushed, and the convivial glass is taken "in solemn silence." The effect is certainly rather startling. A convivial glass to the memory of one departed has surely something in it of practical absurdity."—Mrs. Stone's *Chronicles of Fashion* (1845). The absurdity of the whole toasting system has incurred the reprehension of temperance societies, without any perceptible abatement; but the old custom of drinking healths at private parties is now given up in good society, along with the excesses which were formerly practiced.

Space is not afforded in the present work to do more than glance at the diversity of D. U. in connection with domestic events and social intercourse. There were, as is well known, at one time drinkings on the occasion of births, baptisms, marriages, and even deaths; these last, which included the gloomy festivities of the *Lykwake*, or wake over the corpse of the deceased, being a relic of a very ancient custom, as was that, at least in Scotland, of drinking the *dredgy* (dirge) after the funeral solemnities were completed. In whatever manner these, as well as many other D. U., originated, it cannot be doubted that they were long maintained from the force of custom, along with that demand for artificial stimulus provoked by the naturally phlegmatic character of a northern people. For the long nights of a cheerless climate, there seems to have been sought the solacement of those intoxicating agents, in which it would have been fatal to indulge—where they were not needed—under the sunny skies of the south. We believe this is really the philosophy of the subject, if there be any philosophy in it; and it cannot fail to be observed, that just in proportion to an increase in the number of comfortable homes, the cultivation of mental resources, and the spread of a taste for harmless recreations, the more odious of the old convivialities disappear. Latterly, many amusing traditions respecting the drinking habits of a past age in Scotland, where they longest flourished without alteration, have been given in the *Memoirs of Lord Cockburn*; the *Autobiography of the Rev. Dr. Alexander Carlyle*; and the *Reminiscences of Scottish Life and Character*, by the Very Rev. Dean Ramsay (1860).

As regards miscellaneous drinking observances at one time common, we can refer but to a few of the more prominent. Perhaps the most offensive of all was that customary among tradesmen of imposing fines to be consumed in liquor. Apprentices, on being introduced to a workshop, paid so much entry-money to be spent in drink, and similar exactions were made from journeymen on entering a new employment. This was called paying their *footing*. When Benjamin Franklin, on his getting employment in a printing-office in London, refused to comply with this mischievous custom, he experienced, as he tells us, a variety of petty annoyances. Among shipwrights, the penalty of non-payment was flogging with a hand-saw from time to time, and other maltreatment. We refer to Dunlop's *Drinking Usages of Great Britain* (1839) for many curious details of this kind. Happily, the abolition of these usages has kept pace with the increasing intelligence of the working-classes, and of such outrages little is now heard. Prisoners, on being lodged in jail, as related in the novels of Smollett and others, were obliged to pay *garnish* for drink to the brotherhood of which they had become members. This pitiless exaction is now totally gone, through the efficacy of modern prison-discipline.

The giving of *vails* (Lat. *vale*, farewell) to servants on quitting a gentleman's house, which became so intolerable in the 18th c., as at length to be given up by universal consent, meant, doubtless, a gift to be spent in drink to the health of the donor, and was analogous to the custom of giving a *trink-geld* in Germany, and a *pour boire* in France, to servants, drivers of carriages, and others. There were, at one time, numerous drinking usages connected with departures. We need only notice the *bonaville* (Fr. *bon allez*), or, as it is sometimes called, a *foy* (Fr. *voie*), a festive drinking at the away-going of servants or of persons in a still higher degree, once common in the lowlands of Scotland; also the *stirrup-cup*, or, as it is called in the Highlands, *deoch an dorris*, or drink on getting on horseback, and being ready to set off.—For the moral and physical evils connected with D. U., and the means taken to redress them, we refer to the article TEMPERANCE.

DRIP, the projecting edge of a molding, so channeled as that the rain will drip from it instead of trickling down the wall.—*Parker*.

DRIPSTONE (Fr. *larmier*). The D. is a projecting molding or tablet placed over the head of a Gothic doorway or window, for the purpose of throwing off the water, whence it is also known as a water-table or weather-molding. Though such was, no doubt, its primitive use, the D. latterly became a mere ornamental appendage, which served to enrich and define the outline of the arch. It does not generally extend lower than the springing of the arch, though this rule is by no means without exceptions. When the tracery extends to a lower level, the external D. usually accompanies it, and Parker mentions that, at the n. doorway of Otham church, Kent, it descends the whole length of the jamb. The D. is not so constant a feature in continental as in English Gothic.

DRISLER, HENRY, LL.D., born 1818; graduated at Columbia College, 1839, and was instructor in the grammar school there for several years; then teacher of Greek and Latin; in 1845 adjunct professor in the same department; in 1857 professor of Latin, and in 1867 of Greek. In 1878, during President Barnard's absence in Europe, he was president *pro tem.* of the college. He had also for several years assisted Prof. Anthon in editing his classical text-books. Besides many minor contributions to linguistic study, he has edited (1846) Liddell and Scott's translation of Passow's Greek Lexicon, and (1870) an enlargement of Yonge's English-Greek Lexicon.

In 1878 he edited the first of a series of classical texts and commentaries written by a number of eminent classical scholars. In 1882, in conjunction with the English editors, he brought out an enlarged edition of Liddell and Scott's Greek Lexicon, which appeared simultaneously in England and in this country. In 1886 he received from Harvard the honorary degree of LL.D. In 1888, on the resignation of President Barnard, Dr. Drisler acted as president for one year, at the end of which period he was made Dean of the Faculty of Arts. He retired in 1894.

DRIVER, on shipboard, is the name of a large sail occasionally set upon the mizzen-mast with a yard or gaff. A boom, called the *driver-boom*, extends the lower part of the sail a good way over the stern, like a cutter's mainsail.

DRIVING, FURIOUS. Travelers shall drive on the highway only at a moderate rate of speed, and furious and reckless driving on thronged thoroughfares is an indictable offense at common law, punishable by fines and imprisonment. In the United States the rate of driving in cities is, in the absence of state laws, regulated by the municipalities. The offense has become statutory in England, and a series of acts have been passed, under which prosecutions are now usually brought. See **RULE OF THE ROAD.**

DROGHEDA (Ir. "bridge of the ford"), a well-built municipal burgh and seaport, in a county by itself of 9 sq. m., on the borders of Meath and Louth, on both sides, but chiefly n. of the Boyne, 4 m. from its mouth, and 31 m. n. of Dublin. The Dublin and Belfast railway crosses the Boyne here by a viaduct 95 ft. high. There are linen and cotton manufactures, tanning and brewing works, and an iron foundry. It has a considerable trade, chiefly with Liverpool, 140 m. e.s.e. principally in corn, meal, flour, cattle, provisions, linen, hides, and butter. Great quantities of ale are sent to the colonies. Each census since 1841 shows a falling off in the population. At that date it contained 17,300 inhabitants, while in 1891 the population numbered only 11,812. Till 1885, D. sent one member to parliament. The parts of D. on the opposite sides of the river formed two opposing corporations till 1412, when a sermon by a monk induced them to get a charter of union from Henry I. From the 14th to the 17th century, D. was the chief military station in Leinster. Many parliaments were held in D., and it had the right to coin money. In 1649, Cromwell stormed D. and put 2,000 of the garrison to the sword. Poyning's laws were enacted here. D. surrendered to William III. the day after the battle of the Boyne, which was fought in 1690 at Oldbridge, 4 m. w. of Drogheda. One of the four ancient gates of D. still remains, and the ruins of many friaries and monastic institutions. Frequent cattle fairs are held here.

DROGUE AMÈRE (Fr. bitter drug) a celebrated stomachic bitter; of which the basis is creat root, and the other ingredients mastic, frankincense, myrrh, and aloes, all steeped for about a month in brandy, which is then strained and bottled.

DROHOBICZ, a t. of Austria in the province of Galicia, is situated on the Tyszmanika, a tributary of the Dniester, in lat. 49° 25' n., and long. 23° 30' east. The town is in general ill-built, but it contains several interesting edifices, including a Basilian monastery, a castle, a high school, and two very handsome churches. D. has extensive salt-works, and supplies large quantities of ozokerit. There are also in the vicinity iron-mines and pitch-wells. D. has likewise a good trade in wine, linen, cotton, leather, and groceries. It has, besides, corn and cattle markets. Pop. '90, 17,784.

DROIT D'AUBAINE (Lat. *alibi nati*). By the old custom of France, the king was entitled, on the death of a foreigner who had taken up his fixed residence there, to claim his movable estate, notwithstanding any testamentary settlement which he might have left. But when a foreigner went to France as a traveler, merchant, or foreign minister without any intention of fixing his residence there, the droit d'aubaine was excluded. The Swiss, Savoyards, Scotch, and Portuguese were exempted. This antiquated piece of injustice was abolished in 1819.

DROITS OF THE ADMIRALTY. Certain rights or perquisites formerly pertaining to the British Admiralty (q. v.) arising from subjects within its jurisdiction, as wrecks, derelicts, and, under certain circumstances, detained or captured ships of the public enemy. These rights now accrue to the national exchequer.

DROITWICH, a municipal borough in Worcestershire, 7 m. n.n.e. of Worcester, in the narrow valley of the small river Salwarp, on the Bristol and Birmingham and West Midland railway, and on a canal connected with the Severn, which admits vessels of 60 tons. It gives its name to a parliamentary division. It has direct communication, also, by means of other canals, with Birmingham and London and the intermediate district. Its chief trade is salt, for which it has been famous from remote times, and which is esteemed the best in Europe. In the middle of the town, rising from a

depth of 200 ft., through beds of new red sandstone and gypsum, are the celebrated wycles, or brine-springs, yielding annually large quantities of salt, part of which is exported to foreign countries. Pop. '91, of the municipal borough, 4,021; of the parliamentary division, 48,700. D. sends one member to parliament. It was the Roman *Salinæ*. The remains of a villa were found here, with tessellated pavements, etc.

DRÔME, a department of France, on the e. bank of the Rhône, to the s. of the department of Isère. Area, 2,500 sq. miles. Pop. '96, 303,491. In the w. of the department, running from n. to s. along the Rhône, stretches a sandy plain of 5 to 8 m. in breadth, but toward the e. the surface is hilly, a spur of the Alps traversing the eastern boundary, and sending offshoots of about 3,500 ft. in average height westward across almost the entire area of Drôme. These heights, whose sides are covered with forests of pine, oak, and beech, afford excellent pasturage in summer and autumn. The general direction of the rivers of D. is westward, toward the Rhône, and the most notable of them are the Drôme, from which the department takes its name, and the Isère. Vines and mulberry, chestnut, walnut, and olive trees are extensively grown. Many of the vineyards are famous, but perhaps the most celebrated is that of L'Hérmitage, near Tain, on the banks of the Rhône, which yields red and white wines hardly surpassed by any in the world. The vine culture, however, has been greatly retarded by the phylloxera. In the production of mulberry leaves and in silk-worm culture it is one of the leading departments in France. The manufactures consist chiefly of woolen cloth, silk, hosiery, serge, and cotton yarn. The department is traversed by the Lyon and Avignon railway. It is divided into the four arrondissements of Valence, Montélimart, Die, Nyons, with the town of Valence for capital.

DROMEDARY, a name sometimes given, probably at first through mistake, to the Arabian or one-humped camel (*camelus dromedarius*), but properly belonging to a variety of that species, distinguished by slenderness of limbs and symmetry of form, and by extraordinary fleetness. It has been well described as "bearing much the same relation to the ordinary camel as a race-horse or hunter does to a cart-horse." The word dromedary is derived from the obsolete Greek *dremo*, to run. The pace of the D. is a trot, which it can maintain without intermission for a prodigious length of time; often at the rate of 9 m. an hour for many hours together; whilst a journey of upwards of 600 m. is performed at a somewhat slower rate in five days. Even its more rapid pace can be maintained for twenty-four hours at a stretch, without sign of weariness and without stopping to bait; and if then it is allowed a little refreshment, of a ball of paste made of barley and powdered dates and a little water or camel's milk, it will resume its journey, and go on with undiminished speed for twenty-four hours more. The jolting to the rider is terrible. The gallop is a pace unsuitable to the D., and at which it very soon fails. Dromedaries are sometimes trained to run races. White dromedaries are particularly prized in some parts of the east. See CAMEL.

DROMORE (*Druim Mor*, Great Ridge), an episcopal city in Ireland, in the co. of Down, on the Lagan, 16 m. s.w. of Belfast. It has linen manufactures. Pop. about 2,500. In the peat-bogs here were found the remains of an elk, the space between the extremities of whose horns measured 10 ft. 3 in. North of D. is a mound or rath, 60 ft. high, with three concentric intrenchments, and great outworks towards the Lagan. The see of D. was founded by St. Colman in the 6th c., but is now united with those of Down and Connor. It has a cathedral in which Jeremy Taylor, who was bishop of D., is buried.

DRONE. See BEE.

DRONE. See BAGPIPE.

DRONTHEIM. See THRONDHJEM.

DROORAJAPATAM, or DOOGORAUZEPATAM, a t. on the Coromandel coast of Hindustan, possesses remarkable facilities for navigation, both maritime and inland. It stands on an inlet, which connects Blackwood harbor with Pulicat lake, the former being the only safe haven on the w. side of the bay of Bengal.

DROPSY (Gr. *hydrops*, from *hydor*, water), a class of diseases always of serious import, though not often, perhaps, directly fatal. D. is rather a symptom than a disease; it consists of the effusion of watery fluid from the blood into the skin and subjacent textures, or into the cavities of the body. When the effusion is chiefly in the superficial parts, the D. is called *anasarca* (*ana*, upon; *sarx*, the flesh); when it is in the abdomen, it is termed *ascites*; when in the chest, *hydrothorax*. D. most commonly depends on disease of the heart (q.v.) or kidneys (q.v.); in cases of *ascites*, the liver and spleen are often at fault. The treatment of D. is chiefly by diuretics (q.v.), and other evacuant remedies, which remove the fluid from the textures by unloading the blood of its excess of serum. It is, however, a matter of some difficulty to find the proper remedy in each individual case. In all cases of D., the internal organs should be, if possible, submitted to a strict medical examination, and the treatment regulated accordingly. It cannot be too clearly borne in mind by all that a dropsy is a transudation and not an exudation, and is not a direct product of inflammation, as the latter is. For instance, the fluid which is poured into the cavity of the pleura in pleurisy is not a dropsy, but an exudation of plastic material from the blood, which has the prop-

erty of becoming organized into a kind of pseudo-tissue which forms adhesions between the lungs and the sides of the chest. In dropsy, the fluid has no power of organization, although it contains a slight portion of constituents of blood serum. Exudations have a turbid appearance when they are not colored with the red corpuscles of the blood, but the effused transuded fluid of dropsy is usually quite transparent, although sometimes tinged with the coloring matter of the blood. As a rule, dropsies are caused by obstructions to the return of blood by the veins, and may be general or local. In general dropsy there is an accumulation of watery fluid into the cellular tissue of a part or whole of the body, together with a transudation into one of the serous cavities. Such dropsies are apt to follow diseases of the heart (q.v.). Again, general dropsy may be owing to a morbid condition of the blood in diseases of the kidney (q.v.). It is then called *renal dropsy*, while that caused by disease of the heart is called *cardiac dropsy*. Local dropsies, when existing in the cellular tissue, are circumscribed. Thus, anasarca confined to the limbs would be called a local dropsy, whereas when spreading over the whole body it would be called general, although the cellular tissue only is invaded. For the causes of dropsy of the belly, or *ascites*, see more particularly LIVER, DISEASES OF THE. But ascites, as well as dropsy of other cavities than the peritoneum, may be the result of scarlet fever, which has for one of its sequelæ inflammation of the kidneys. The pressure of a tumor may cause dropsy. Pressure upon the portal vein may be followed by ascites; upon the ascending *vena cava*, or great vein which carries the blood from the trunk and lower extremities to the heart, anasarca of the trunk and lower extremities. When the pressure is upon one of the iliac veins, anasarca of one of the lower limbs is the consequence. The treatment of dropsy depends upon the condition of the organs or parts of the body where morbid condition is its cause. Renal dropsy, besides general treatment, will require remedies calculated to relieve the renal disease, and a similar remark applies to hepatic dropsy. The general treatment for all forms of dropsy includes sometimes the removal of the watery fluid from the serous cavities, and also from the cellular tissue. This is sometimes accomplished by tapping, or *paracentesis*, when the liquid is drawn from a cavity; when from the abdomen, *paracentesis abdominalis*; when from the chest, *P. thoracis*; when from the head, *P. capitis*. The withdrawal of the liquid from the cellular tissue is performed by making numerous small punctures. The therapeutical remedies consist of diaphoretics, diuretics, and cathartics; and although they are often employed with more or less benefit, and sometimes assist in recovery, they frequently fail to give the hoped-for relief. Cathartics, especially those which belong to the class called *hydrogogue*, often reduce the amount of liquid considerably; but it generally returns, especially in incurable cases, and the patient is made weaker by the operation; and similar objections hold with regard to diuretics; they often relieve for a time, but are perhaps quite as often unsatisfactory. Both remedies in unfavorable cases may be called necessary evils. Diaphoretics may be given with more freedom, although the objection that they promote debility to a certain extent applies to them also. The use of jaborandi, or its alkaloid, which has been recently introduced into practice in this country, is perhaps attended with more benefit than that of any other diaphoretic. (See JABORANDI.)

DROPWORT. See SPIRÆA and WATER DROPWORT.

DROSERA CÆÆ, a natural order of exogenous plants, consisting entirely of herbaceous plants, which generally inhabit marshy places, and are often covered with glands. The leaves are frequently all radical, and they and the flower-stalks are rolled up in bud like the fronds of ferns. There are 5 sepals, 5 petals, 5, 10, 15, or 20 stamens; the fruit a one-celled capsule, with numerous seeds. About 100 species are known, distributed over most parts of the world, many of them plants of very delicate appearance; and many of them, as the species of *drosera* or SUNDEW, natives of Britain, are remarkable for their glandular hairs, which secrete a viscid fluid, and by means of it often fatally detain flies which alight on them. *Rosicula dentata* is placed in houses in s. Africa on this account. Venus' fly-trap belongs to this order. See DIONÆA. Acrid and stimulant properties prevail in the droseraceæ.

DROSOMETER, an instrument for measuring dew. It is a simple balance in even poise, on one scale of which the dew falls, while the other is protected. The weights on the dry scale indicate the amount of dew on the wet scale.

DROSTE-HÜLSHOFF, ANNETTE ELIZABETH, a distinguished lyric poetess of Germany, b. 10th Jan., 1797, on the estate of Hülshoff, near Münster. Of a delicate constitution, and living in complete seclusion from the world, she nevertheless received an excellent scientific education. In the year 1825, she was first introduced into a wider circle of distinguished men and women at Cologne and Bonn, but in a short time retired again to her maternal estate of Rischhaus, near Münster, where she lived almost exclusively for science, nature, and poetry. She died at a place near lake Constance, 24th May, 1848. While occupying a distinguished place among the literary women of the time, she retained all the characteristic timidity of her sex, avoiding those eccentricities into which many women fall who think they have a mission to regenerate society. Her *Gedichte* (Poems) appeared at Stuttgart in 1844, and of her posthumous works *Das geistliche Jahr nebst einem Anhang religiöser Gedichte* at Stuttgart in 1852.

The poems are not only perfect as regards form, but unite a womanly gentleness and poetical creative power in a degree seldom seen in the writings of women.

DROUET, JEAN BAPTISTE, Comte d'ERLON, French marshal, was b. 29th July, 1765, at Rheims, entered a regiment of volunteers in 1792, and took part during the years 1793-96 in the campaigns of the Moselle, Meuse, and Sambre. His important services quickly obtained him promotion. His conduct in the peninsular war was highly distinguished, and elicited the warmest eulogiums from Massena. After the fall of Napoleon, the Bourbons tried to secure his services, and gave him the command of the 16th division, but he was shortly after arrested on the charge of conspiring against the royal family. Managing to escape, he remained in concealment in Lille until the return of Napoleon from Elba, when, putting himself at the head of the troops, he seized the citadel and held it for the emperor, who made him a peer of France. At the battle of Waterloo he commanded the first *corps d'armée*. After the capitulation of Paris, he fled to Bavaria, where he resided until the July revolution, when he returned to France, and received in 1832 the command of the army of Vendée. During 1834-35, he held the important office of governor-general of Algeria, and in 1843 was elevated to the rank of marshal. D. died 25th Jan., 1844.

DROUYN DE LHUYS, EDOUARD, an eminent French diplomatist and politician, was b. at Paris, Nov. 19, 1805, and studied at the college of Louis-le-Grand and the Ecole de Droit. He was at first attached to the embassy at Madrid, whither he proceeded in 1830. In 1840, he was placed at the head of the commercial department under the minister of foreign affairs, and shortly after was elected *député* for Melun; but taking a part hostile to the government, of which he was a subordinate member, he was deprived of his situation by M. Guizot. This gave him fuller scope for the advocacy of his political opinions. He now became an active member of the *Reforme* party, and after the famous banquet of the 12th arrondissement had been interdicted, he signed, along with the other chiefs of the opposition, the accusation drawn up against M. Guizot and his colleagues. Elected representative of the people to the constituent and legislative assemblies, by the department of Seine-et-Marne, he was made first a member and then president of the committee of foreign affairs. Here he acted generally with the moderate party. In the first cabinet formed by Louis Napoleon after his election to the presidency (Dec., 1848), he became minister of foreign affairs, and directed the French policy in all the difficult European complications of the year. In 1849, he went to London for a short time as ambassador, and after the *coup d'état* became one of the vice-presidents of the imperial senate, and again minister of foreign affairs. Being disappointed at the issue of the Vienna conferences in 1855, he resigned his office. In 1863, he was recalled to his old post, resigning again in 1866. On the fall of the empire, he fled for a time to Jersey. He d. 1881.

DROWN, THOMAS MESSINGER, chemist, was born in Philadelphia, Penn., March 19, 1842. He graduated at the Philadelphia high school in 1859, and received his degree of doctor of medicine from the University of Pennsylvania in 1862. He studied at Freiberg in Saxony and at the university of Heidelberg. He was instructor of metallurgy in Harvard, 1869, and in 1874 was appointed to the chair of analytical chemistry in Lafayette college. In 1885 he received the same chair in the Massachusetts Institute of Technology. He has published many papers on metallurgy and chemistry.

DROWNING. See ASPHYXIA.

DROWNING, as a mode of capital punishment, has only lately ceased in Europe, and is probably still in use in some other quarters of the world. Tacitus, writing about the end of the 1st c., tells us that the Germans hanged their greater criminals, but that meaner and more infamous offenders were plunged under hurdles into bogs and fens. By the law of the ancient Burgundians, a faithless wife was to be smothered in mud. The Anglo-Saxon codes ordered women convicted of theft to be drowned. The punishment was in such common use throughout the middle ages, that grants of capital jurisdiction ran "*cum fossa et furca*," i.e., "with pit and gallows." The pit, ditch, or well, was for drowning women; but the punishment was occasionally inflicted on men. The doom of the parricide was to be put into a sack and cast into the sea. A canon of Prague, afterwards enrolled in the catalogue of saints, was drowned in 1383, for refusing to reveal the secrets of the confessional. In this instance, perhaps, drowning was allowed to the offender as a matter of favor. So in Scotland, in 1556, a man convicted of theft and sacrilege, was sentenced to be drowned, "by the queen's special grace." So lately as 1611, a man was drowned at Edinburgh for stealing a lamb. By that time, the punishment of drowning had become obsolete in England. It survived in Scotland until 1685. The last execution by drowning in Switzerland was in 1652, in Austria in 1776, in Iceland in 1777. It was abolished in Russia early in the 18th century. In Saxony, a woman convicted of child-murder, was sewn up in a sack, along with a cat, a dog, and a snake, and thus drowned, in 1734.

DROYLSDEN, a large and rapidly increasing Lancashire township, a district parish of Manchester, and 4 m. e. from Manchester, a station on the Lancashire and Yorkshire railway. It is situated on an elevated plain, is irregularly built, the houses of brick,

but many of them very neat. The cotton manufacture is extensively carried on; there are also print-fields, dye-works, and copperas-works. Pop. '81, 8679; '91, 9482.

DROYSSEN, JOHANN GUSTAV, b. 1808; a German historian, studied at Stettin and Berlin, teacher in a gymnasium in the latter city, and private tutor in the university. In 1840, he became professor of history at Kiel, and was prominent in politics during the struggle between Denmark and the duchies, being the author of the *Kiel Address*, and one of the nine protesting professors of the university. He was a representative from Kiel in the diet of Frankfort, and subsequently a member of the Frankfort parliament. In 1851, he was professor of history at Jena, and in 1869, filled the same position in Berlin. He made a number of translations from the Greek, and has written several books on modern history. He d. 1884.

DROZ, ANTOINE GUSTAVE, b. Paris, 1832. He began as a journalist, had extraordinary popular success with a little vol., *Monsieur, Madame, et Bébé*, 1866, and has since published *Entre Nous*, 1867; *Le Cahier Bleu de Mlle. Cibot*, 1868; *Autour d'une Source*, 1869; *Babolain*, 1872; etc. Many of his works have been translated into English. As an exquisite literary workman, an artist in words, he has no superior among cotemporary French writers.

DROZ, FRANÇOIS-XAVIER JOSEPH, 1773-1850; a French writer on morals and politics, who studied law in Paris. In 1799, he published an essay on the art of oratory; some years later, the romance of *Lina*, other essays, works on moral philosophy, on the science of life, and on the application of morals and philosophy to politics and political economy; also on Christianity, and an elaborate history of the reign of Louis XVI. He was a member of the academy.

DRUGGET, a common felt or other coarse woolen fabric, chiefly used for covering carpets, or as a substitute for a carpet.

DRUGS, a name applied to all material agents used in the treatment of disease, when in their crude or commercial forms. See **CHEMISTS** and **DRUGGISTS**.

DRUIDISM. This institution was, perhaps, common to all Celtic nations, but we have detailed accounts only of the form under which it existed in Gaul. Cæsar gives the following description of the character and functions of the Druids: "They attend to divine worship, perform public and private sacrifices, and expound matters of religion. A great number of youths are gathered round them for the sake of education, and they enjoy the highest honor in that nation; for nearly all public and private quarrels come under their jurisdiction; and when any crime has been committed, when a murder has been perpetrated, when a controversy arises about a legacy, or about landmarks, they are the judges too. They fix rewards and punishments; and should any one, whether a private individual or a public man, disobey their decrees, then they exclude him from the sacrifices. This is with them the severest punishment. The persons who are thus laid under interdict are regarded as impious and wicked people; everybody recoils from them, and shuns their society and conversation, lest he should be injured by associating with them. They cannot obtain legal redress when they ask for it, nor are they admitted to any honorable office. All these Druids have one chief, who enjoys the highest authority amongst them. When he dies, he is succeeded by the member of the order who is most prominent amongst the others, if there be any such single individuals; if, however, there are several men equally distinguished, the successor is elected by the Druids. Sometimes they even go to war about this supremacy. At a certain time of the year, the Druids assemble on the territory of the Carnutes, which is believed to be the center of all Gaul, in a sacred place. To that spot are gathered from everywhere all persons that have quarrels, and they abide by their judgments and decrees. It is believed that this institution was invented in Britannia, and thence transplanted into Gaul. Even nowadays, those who wish to become more intimately acquainted with the institution, generally go to Britannia for instruction's sake.

"The Druids take no part in warfare; nor do they pay taxes like the rest of the people; they are exempt from military service, and from all public burdens. Attracted by such rewards, many come to be instructed by their own choice, while others are sent by their parents. They are reported to learn in the school a great number of verses, so that some remain there twenty years. They think it an unhallowed thing to commit their lore to writing, though in the other public and private affairs of life they frequently make use of the Greek alphabet. . . . Beyond all things, they are desirous to inspire a belief that men's souls do not perish, but transmigrate after death from one individual to another; and they hold that people are thereby most strongly urged to bravery, as the fear of death is thus destroyed. Besides, they hold a great many discourses about the stars and their motion, about the size of the world and of various countries, about the nature of things, about the power and might of the immortal gods; and they instruct the youths in these subjects."

It is easy to comprehend that this powerful priesthood did all they could to uphold the national cause against the Roman conquerors, and urged the people to rebellion; so much so, that the emperor Claudius found it necessary to interdict formally the pro-

ting of Druidical rites, which seem, however, to have continued down to the extinction of paganism. Besides being priests and teachers of religion, the Druids appear also to have been adepts in the magic arts, and were versed in the mysterious powers of animals and plants. The oak-tree was especially sacred among the Druids. In oak-groves, they frequently performed their rites, and they even derived their name from this custom. See CELTIC NATIONS. They also had a special reverence for the mistletoe, when growing on an oak. According to Pliny, a Druid, clothed in white, mounted the tree, and with a knife of gold, cut the mistletoe, which was received by another, standing on the ground, in his white robe. The same author gives a curious account of the "serpent's egg," worn as a distinguishing badge by the Druids. It was formed, he says, by the poisonous spittle of a great many serpents twined together. Gathered at moonlight, and afterwards worn in the bosom, it was a mighty talisman. All these particulars refer properly to the Druids of Gaul, but Cæsar's testimony leaves no doubt that the Druidism of Britain was essentially the same.

In all the countries anciently inhabited by Celts, there are found rude structures of stone, one of the most common forms of which is the so-called *dolmen* (see that article). The older archaeologists assumed that these were Druidical altars, but there is no proof that such was their destination or origin: similar structures are found in Scandinavia and many parts of Germany, and to assume in all these countries the presence of Celts, seems too hazardous. The same doubts prevail as to the larger monuments of this kind—the supposed Druidical temples of Amesbury, of Carnac in Brittany, and of Stonehenge (see that article).

DRUIDS, ORDERS OF, various social and benevolent organizations on the masonic plan, widely distributed in England, Australia, and the United States. The first order was formed in London, 1781; the first lodge in New York was organized 1833. In this country, 5 degrees have been added to the entrance degree; degrees have been instituted in England also. There are probably 125,000 members in all the world, of which more than 50,000 are in England, and perhaps 20,000 in the United States. In this country there were, 1870, about 150 "groves," of which number about two thirds were mainly of German membership.

DRUM (*druim*), a Celtic word meaning the back, and applied to a ridge of hills, enters into the composition of many names of places, especially in Ireland, as Drumcondra, Drumglass, Drumsheugh.

DRUM (Gr. *trommel*; Fr. *tambour*—a modification of *tabour*; *timbrel* and *tambourine* are other forms of the word *tabour* or *tambour*), a hollow cylinder of wood or metal, having skin (parchment) stretched across one or both ends, upon which the drummer beats with an instrument of wood or metal called a *drumstick*. The drum is used as an instrument of music along with other instruments in bands, and particularly for military purposes. The military drum serves for giving various signals as well as for music. There are three kinds of drum—the *side* drum, the *big* or *base* drum, and the *kettle* drum. Since 1858, the British infantry are supplied with brass side drums, 3 lbs. lighter than those formerly in use, and tuned with screws instead of straps and ropes. The cavalry drum is a copper or brass hemisphere, thus resembling a *kettle*, with a parchment lid. The big drum has both ends covered with parchment. The ancient Romans used small *hand-drums*—some resembling *tambourines*, others *kettle-drums*—in their religious dances; and the Parthians are said to have used them in war to give signals.

DRUM, a name given to a fashionable and crowded evening-party about the middle of the 18th c., at which card-playing appears to have been the chief attraction. The names drum, rout, and hurricane, by which these gay assemblies were known, sufficiently indicate their noisy, promiscuous, and irrational character. Lady Mary Wortley Montagu, writing from Louvère to her daughter in 1753, hints that ladies gave these entertainments to make money at cards to support their extravagance; and adds: "I find I should be as solitary in London as I am here, it being impossible to live in a *drum*, which, I think, so far from a cure of uneasiness, that it is, in my opinion, adding one more to the heap." See ROUT.

DRUMCLOG is a tract of moorland in Lanarkshire, Scotland. It is famous in history as the place where two hundred Cameronians defeated Claverhouse (q.v.) on June 11, 1679. A monument has been erected on the spot. For a graphic account of this battle the reader is referred to Scott's *Old Mortality*.

DRUM, RICHARD COULTER, b. Penn. in 1825; entered the U. S. army, 1846; served in the Mexican and civil wars; was promoted through various grades to colonel and asst. adjt.-gen., 1869; was appointed adjutant-general and brigadier-general of the army, 1880; and was retired, 1889.

DRUM, SACRED, an object of religious veneration and instrument of magical incantation among the Laplanders in former times. It was hollowed out of a piece of the trunk of a pine or birch, in which certain peculiarities were required, and was covered with skin on the upper side only, the wood being partly left on the under side to serve as a handle. Figures were painted in red on the skin; the drumstick was a reindeer's horn; and to the drum were appended a large copper ring and some smaller rings. The drum was considered a necessary part of the furniture of every family. The motions

of the rings, when the drum was beaten, which might be done only by the head of the family, were supposed to afford indications concerning the results of disease and other future events. The beating of the drum was accompanied with songs, and the person by whom it was beaten often fell into a trance, during which revelations were supposed to be made to him. The sacred drum seems to have been somehow connected with the worship of the sun.

DRUM-FISH, *Pogonias chromis*, of the family SCIENIDÆ, a fish allied to the *sheep's-head*, and inhabiting the shores of the United States, from New York to Florida, in schools. They vary from 2 to 4 ft. in length, and 15 to 18 in. in breadth, weighing from 10 to 25 lbs. Sometimes they are larger, weighing as much as 80 lbs. Scales large, stout, oblique; teeth on the jaws in a band. Pharyngeals with large paved teeth. Tongue broad, short, smooth; branchial rays, seven; dorsal fin has 10 stout, flattened rays, capable of being concealed in a furrow. Second dorsal fin rises at the termination of the first; pectoral fins large and pointed; air-bladder large and thick coated; spleen very long; stomach thick and muscular, with strong muscular columns; vertebræ, 24; color, bronze to red, rather lighter beneath, with a blackish spot behind the pectoral. There are two varieties according to De Kay, one dark brown, the *black drum* of the fishermen, the other the *red drum*. They are coarse food, but the young are regarded as a delicacy. The fish of this genus are remarkable on account of the noise which they make under water, which resembles that of a distant drum, and there is a difference of opinion as to the cause. Cuvier thought it had some connection with the air-bladder; De Kay attributes it to the compressing together of the broad pharyngeal teeth, and so do most of the fishermen, but they also believe that the trituration of the shell-fish upon which they feed is the more immediate cause of the sound. They afford good sport; the line should be baited with soft clams or muscles, with the shell left on. Another species of *D.* is described and figured by DeKay, the *pogonias fasciatus*, much smaller, from 7 to 10 in. long, having four or five blackish vertical bands extending down the sides; the pectoral fins are a faint yellow, the others dark brown. This has been supposed to be the young of the *P. chromis*, but DeKay has seen them 6 in. long in Sept., having all the characteristics of the adult fish. Its teeth and jaws, as well as stomach, resemble those of the larger fish. It has various names, as *young drum*, *grunter*.

DRUM-HEAD COURT MARTIAL. See COURTS-MARTIAL.

DRUM-MAJOR, in the U. S. army, the leader of the drum-corps of a regiment. He has command over the drummers and fifers, instructs them in their duties, and directs their movements while on parade. He ranks as a sergeant, and is attached to the non-commissioned staff.

DRUMMER. In the U. S. army every company of infantry has one fifer and one drummer. They rank as privates, and their duties are to execute signals, perform at parades, drills, and reviews, and to attend the wounded on the battlefield. Drummers are usually boys, and often the sons of soldiers. With the fifers they collectively constitute the regimental field music or drum-corps.

DRUMMER. See COMMERCIAL TRAVELERS.

DRUMMOND, a co. in the province of Quebec, Canada, intersected by St. Francis river; 600 sq. m. Chief town, Drummondville East. Pop. '91, 21,983.

DRUMMOND, Sir GEORGE GORDON, 1771-1854; b. Quebec; entered the British army, 1789; served in Holland and Egypt, and was made lieut.-gen., 1811. He was second in command under sir George Prevost, 1813; planned the capture of Fort Niagara in that year, defeated the Americans at Fort Oswego, 1814, May, and was in chief command of the British forces at the battle of Lundy's Lane in June. In August, however, he sustained a severe repulse at Fort Erie. He was appointed gov. gen. of Canada, 1815, but returned to England, 1816, and resided in London until his death.

DRUMMOND, HENRY, LL.D., lecturer and author, was b. at Stirling, Scotland, in 1851; was educated at the university of Edinburgh, passed through the Free Church Divinity Hall, and was appointed to a mission chapel in Malta, returning to Scotland to become a lecturer in the Free Church college, Glasgow. He lectured in Australia and in the United States, and twice visited Africa. He was an attractive preacher and a most stimulating writer. Among his works are *Natural Law in the Spiritual World* (1883); *The Greatest Thing in the World* (1890); *Pax Vobiscum* (1890); *Tropical Africa* (4th ed. 1891); *The Changed Life* (1891); *The City without a Church* (1893); *The Ascent of Man* (1894), etc. He d. in 1897.

DRUMMOND, Captain THOMAS, R.E., was born at Edinburgh in 1797, and during his professional training at Woolwich and Chatham displayed high mathematical and mechanical abilities, with much aptitude for the application of scientific principles to practical affairs. In 1820, he was engaged by col. Colby to assist in the trigonometrical survey of the United Kingdom. The incandescence of lime having been brought under his notice at a lecture on chemistry, the idea occurred to him that it might be advantageously used on the survey to render distant objects visible: he accordingly made experiments, which, with their results, and the first application of the Drummond light (q.v.) in Ireland, are described by him in the *Philosophical Transactions* for 1826. A heliostat

(q.v.) of his invention, described in the same paper, has ever since been employed with success in the survey. Experiments which he made with the view of adapting his "*Light*" to light-houses, are detailed in the *Philosophical Transactions* for 1830. When exhibited at Purfleet, it was powerful enough to cast shadows at Blackwall, distant 10 miles. Practical difficulties, not yet overcome, prevented the fulfillment of his hopes in this direction; his attention having been diverted to political life, for which he soon proved himself to be eminently fit. As the head of a commission appointed by lord Grey's government to superintend the fixing of the boundaries of the boroughs under the provisions of the reform bill, he performed most ably that laborious and important work. He next acted as private secretary to lord Althorp, chancellor of the exchequer; and finally, in 1835, went to Dublin with lord Mulgrave, as under-secretary for Ireland. Here the knowledge of Irish character and feelings which he had acquired in the survey was of great advantage to him, and by his impartiality, sound judgment, conciliatory disposition, indefatigable energy, and hearty devotion to the work before him, he at once gained the confidence and affection of the people. He died in 1840.

DRUMMOND, WILLIAM, OF HAWTHORNDEN, a poet of considerable celebrity, was descended from a very ancient and noble Scottish family, and was b. 13th Dec., 1585. He was educated at the high school of Edinburgh, and afterwards at the university of that city, where he took his degree of M.A., July 27, 1605. On leaving college, he was sent to the continent in order to study law, for which he exhibited great aptitude. He returned in 1609, and his father dying in the following year, he retired to the paternal estate at Hawthornden, which, according to the learned Ruddiman, "was a sweet and solitary seat, and very fit and proper for the muses;" and there, with an interval of 8 years of foreign travel, spent his life in his favorite literary pursuits. He died 4th Dec., 1649; his death, it is said, being hastened by his excessive grief for the fate of Charles I. His principal works are the following: *Tears on the Death of Mœliades*—prince Henry, son of James I.—(Edin. 1613); *Poems: Amorous, Funerall, Divine, Pastorall, in Sonnets, Songs, Sextains, Madrigals* (1616); *Forth Feasting* (1617); *Polemo Middinia* (Oxford, 1691). After relinquishing poetry, he wrote a sectional history of Scotland, known as the *History of the Five Jameses*. A standard edition of his poems was edited for the Maitland club by Dr. Irving and lord Dundrennan in 1832. Smaller editions appeared in 1833 and 1856, and an exhaustive life, with an account of his writings, by prof. Masson, in 1873. D. enjoyed the friendship of many of his literary contemporaries, including Drayton and "rare" Ben Jonson, the latter of whom visited him at Hawthornden in 1619. D.'s *Notes of Ben Jonson's Conversations with William Drummond of Hawthornden*, is a characteristic record of the literary spirit of the time.

D.'s verse abounds in the conceits, antitheses, and hyperboles of the period, and gives indication of a mind indulging itself in melancholy. His sonnets are the best specimens of his muse, although even in them one looks in vain for sustained harmony or great originality of thought.

DRUMMOND, Sir WILLIAM, 1760–1828; an English diplomatist, author of a *Review of the Government of Sparta and Athens; Origines, or Remarks on the Origin of Several Empires, States, and Cities*, etc. In 1796 and 1801, he was a member of parliament, and was made diplomatic representative in Naples and Constantinople. In *The Œdipus Judaicus* he undertook to explain some of the Old Testament narratives as being astronomical allegories, for which he was very sharply censured.

DRUMMOND ISLAND, belonging to Chippewa co., Mich., is in lake Huron, being the most westerly of the Manitoulin chain. It measures 20 m. by 10, and lies about 30 m. to the e. of Mackinaw an island in the strait of the same name, which pours lake Michigan into lake Huron.

DRUMMOND LIGHT, or LIME-BALL LIGHT. The heat given out during the combustion of a mixture of hydrogen and oxygen gases, or of coal-gas and oxygen, is very intense; and when the mixture is directed on an infusible substance such as lime, a most brilliant light is evolved. Capt. Drummond, R.E., originally proposed the employment of this light in the trigonometrical survey of Great Britain, and constructed apparatus for its production. See **DRUMMOND, THOMAS**. In the most convenient form of the apparatus the mixed gases escaping by a jet, being set fire to and made to impinge upon a cylinder of lime, raise the surface of the latter nearest the jet to a white heat, accompanied by a dazzling light. As minute portions of lime become detached and are volatilized from the spot on the lime on which the jet of burning gases strikes, it is necessary to expose a new surface of lime to the gases, and for this purpose a screw may be turned by the hand or by clockwork. The hydrogen and oxygen ought to be confined in separate gas-holders or bags, and to be brought by different tubes, provided with separate stop-cocks, to within a short distance of the exit jet. The common tube through which the mingled gases pass to the jet is about 6 in. long by two thirds of an inch in diameter; and in Mr. Hemming's construction the tube is very closely packed, full of very fine brass wire, which is afterwards wedged in by a stout wire being driven down the center. The object of the fine wires is to prevent the return of the flame, which might lead to a disastrous explosion. When the rays from this light are concentrated by a parabolic reflector, it can be seen at immense distances. Thus, on the 31st Dec., 1845, at half-past 3 P.M. (daylight), the light was exhibited on the top of Slieve

Donard, in county Down, and was seen from the top of Snowdon, a distance of 108 m.; and in other instances the D. L. has been seen at distances up to 112 miles. The employment of coal-gas instead of hydrogen has greatly increased the applications of the D. L., and it is now often used in magic-lanterns and other apparatus where great brilliancy and penetration of light are required. It has been used lately on the continent with great effect in illuminations. Great caution should at all times be exercised in the preparation, storing, and employment of the gases, as many dangerous explosions have occurred. Little heat is evolved from the D. L., nor does it vitiate the surrounding air, or consume its oxygen.

DRUNKENNESS. See INTOXICATION, and also TEMPERANCE: DIPSOMANIA.

DRUPACEÆ, a species of plants, placed by many as a sub-order of *rosaceæ*, having a one-celled, one-seeded indehiscent fruit, consisting of a fleshy, succulent exterior, and hard stone in center containing seed, such as the peach, plum, and cherry.

DRUPE, in botany, a succulent fruit containing a single seed or kernel, usually inclosed in a hard "stone," the *endocarp*. The succulent part is the *mesocarp*. Examples are familiar in the fruits generally known as stone-fruits, the peach, plum, cherry, etc. In the almond, the mesocarp is not succulent, yet the fruit otherwise possessing all the characters of a D., receives that name. It may be regarded as intermediate between a D. and a nut. The fruits of the genus *rubus* (raspberry, bramble) are composed of many small aggregated drupes, upon a common receptacle. The date is a D. in which the hard "stone" is represented by a membrane.

DRURY, DRU, a goldsmith, silversmith, and cutler, in London, where he was b., 4th Feb., 1725, was devoted to the study of entomology and the collection of exotic insects. His *Illustrations of Exotic Entomology* (2 vols., Lond. 1773-82), a work unrivaled at the time of its publication for the accuracy and beauty of its figures, is still in high repute as a book of reference. D. was also assiduous in his endeavors to acquire information concerning the habits of insects. He died 15th Dec., 1803.

DRUSES, a remarkable people who inhabit a district in the n. of Syria, comprising the whole of the southern range of Mt. Lebanon and the western slope of Anti-Lebanon. In this district they hold exclusive possession of about 40 towns and villages, and divide the possession of about 200 more with the Maronites (q.v.), while 80 villages in other parts of Anti-Lebanon are peopled by them. The inhabitants of the Lebanon afford a remarkable illustration of the amalgamation of races. After the second captivity of Israel, Esarhaddon re-peopled the wasted strongholds of Samaria with certain fierce tribes, some of whom, called in the Scriptures Cuthites, and known in subsequent times to the Greeks as Carduchi, and familiar to us as Kurds, settled in Lebanon. From them the present D. are supposed to have originally sprung. More than a thousand years later, a fresh colonization took place. The Mardi, a warlike tribe who dwelt to the n. of the Caspian, originally of Persian extraction, were transplanted thither by Constantine IV., in 686 A.D., to the number of 12,000, to act as a bulwark against Mohammedan invasion. The Arabs also, in sweeping through the mountain fastnesses, left a permanent impression there. Thus, Cuthites, Mardi, and Arabs, or rather Mohammedans of various races, have combined to form that strange being—the modern Druse. It has also been supposed by some that there runs in his veins not a little of the blood of the crusaders, but this is doubtful. No immigrations, however, of any importance into the country of the D. took place after the close of the 10th c.; and this period seems naturally to conclude the first great section of Druse history.

The nationality of these mountaineers having now been consolidated, their peculiar and mysterious religion began gradually to be developed. Hakem Biamr Allah, or Bemrillah, caliph of Egypt, and a Nero in cruelty, was the author of this system. He affirmed that he was the representative of God, and, having enlisted his confessor, Darazi, in his cause, he prepared to propound his doctrine. In the 407th year of the hegra (1029 A.D.), the divine nature of Hakem, or rather the incarnation of the spirit of God in him, was publicly announced at Cairo. This revelation, however, was unfavorably received by the mob. Hakem's confessor, Darazi, narrowly escaped the fate of a martyr to the impostures of his master. Retiring, however, to the fastnesses of the Lebanon, he there began to inculcate the principal of the new faith; and although he never acquired any mastery over the sympathies of the mountaineers, he at least left his name to them; for there can be little doubt that the name Druses is derived from that of Darazi. Hamzé, a Persian mystic, and successively the disciple and vizier of Hakem, introduced into the newly promulgated religion all the elements of attraction and strength which it possesses; and him the D. venerate as the actual founder of their faith.

The D. form one of the very few sects among whom proselytism is discouraged. They are remarkable conservatives. For 800 years they have maintained a distinct religious and political independence and nationality. Into their faith the doctrines of the Pentateuch, the Christian gospel, the Koran, and the Sufi allegories, are wonderfully interwoven. They reject, however, the seven points of Islamism, substituting for them the following seven:—1. Veracity (to each other only); 2. Mutual protection and resistance; 3. Renunciation of all other religions; 4. Profession of the unity of Hakem

as God; 5. Contentment with his works; 6. Submission to his will; 7. Separation from those in error, and from demons. They believe in one God in whom there are no parts, to whom they ascribe no attributes, before whom the tongue ceases to utter, the eyes to behold, but who has revealed himself ten times upon the earth under the form and name of mortal men. In Hakem, so Hamzé taught, had God revealed himself for the tenth and last time. They also believe that the number of existing souls never varies, and that all the souls in life now, have lived, vested in some human form, from the beginning of the world, and will so continue to exist till the end of it; that when a man dies, his soul puts on a fresh humanity, which occupies a rank in moral dignity corresponding to the purity or impurity of the past life. But although they believe, in this sense, in the transmigration of souls, they also believe that after the lapse of ages, when the soul will have been purified from every stain, there will come a period of rest. As a religious body, the D. are divided into two classes: the Akals, or those initiated into the Druse mysteries; and the Djahils, the uninitiated. The former do not adorn themselves with gold, or wear silk, embroidered, or fanciful garments; they forbear using wine, spirits, tobacco, and other luxuries, never swear, utter obscene language, or lie. The latter are free from all religious duties. But, however rigid the profession of the Akal or initiated Druse, he is taught that his practice may be conducted in some cases on the principle of expediency. To be truthful, he is taught, is desirable; but when concealment is necessary, then equivocation, or even falsehood may be practiced.

Previous to 1840, Druse and Maronite lived on terms of intimacy and friendship. At that period, however, dissension sprang up between the two tribes, and proved to be the introduction to years of intermittent warfare. The strife reached its climax in 1860. From May to Oct. of that year, accounts of the fearful barbarities practiced by the D. upon the Maronites followed each other with appalling frequency, until the indignation of Europe was roused against them. A conference of the five powers which had guaranteed the independence of Turkey met at Paris, and it was resolved that a French army should proceed to Syria to chastise the D., and that, at the same time, a European commission should, on the spot, make inquiry as to the facts. The troops reached Syria in Aug., 1860. They could not, however, get at the D., who retired into the desert of the Haouran. In the meanwhile, it was ascertained beyond all doubt that the Turks, and the low fanatical mob of Damascus (who have frequently been confounded with the D., because they fomented their passions), were mainly chargeable with the crimes that had been committed; and that the retaliation of the Maronites was equally vindictive and horrible. It is stated that the Maronite leaders—in most cases bishops—on being asked to furnish sworn lists of such of the D. as, from the unusual atrocity of their crimes, were worthy of death, sent in a list demanding 4,946 heads; refusing, however, to bring forward any particular charges. Punishment was inflicted on those who were really to blame. While the French troops remained in Syria, the Turks were compelled to punish the chief Mohammedan criminals, a considerable number of whom, including Achmet Pasha, the governor of Damascus, were shot. In June, 1861, the troops returned to France, and the commissioners drew up a new constitution for the Lebanon, finally revised and signed on 6th Sept., 1864. Under it, the Lebanon is to be ruled by a Christian governor, appointed by the porte; and to be divided into seven districts, under chiefs of the prevalent religion in each. The result was the appointment, as governor, of Daoud Pasha, an Armenian Christian, and of 7 chiefs (4 Maronite, 1 Druse, 1 orthodox Greek, and 1 separatist Greek). The constitution did not satisfy the Maronites, whose revolt, under Joseph Karam, kept the Lebanon in a very unsettled state till 1867. During this period, the governor had to restrain the D. from attacking the Maronite villages in the absence of their defenders. The D. are about 80,000 in number; they are a brave, handsome, and industrious people, and can almost all read and write. They had no superior educational establishment until Daoud Pasha founded and endowed one at Abey. Polygamy is unknown among them. They have, with incredible toil, carried the soil of the valleys up and along the hillsides, which are laid out in terraces, planted with mulberry, olive, and vine. Their chief trade is the manufacture of silk. Corn is also raised, though in very small quantity. Deir-el-Kammar is the principal town. See *Druses of the Lebanon*, by the earl of Carnarvon; Guy's *La Nation Druse*, and Laurence Oliphant's *Haifa* (1887).

DRUSIUS, OR VAN DEN DRIESCHE, JOHANNES, 1550-1616; a native of Flanders, an orientalist, and Protestant divine. He went to England when young, and became professor of oriental languages at Oxford. In 1576, he returned to his own country, and was given the same professorship in Leyden. He was subsequently professor of Hebrew in the university of Franeker, in Friesland. He had a son John who mastered Hebrew before he was nine years old.

DRUSUS, the name of a distinguished family of the gens Livia, which contributed a large proportion of eminent men to the Roman commonwealth. The most conspicuous of the Drusi were: 1. M. LIVIUS DRUSUS, tribune of the people in 122 B.C., who made it the business of his public life to thwart the democratic policy of his colleague, C. Gracchus, and uphold the cause of the senate and nobles, which he did with much skill and ultimate success. 2. His son, who bore the same name as himself, and whose

dangerous and daring political intrigues, conducted partly for the benefit of the aristocratic party whose sympathies he inherited, and not less for his own aggrandizement, kept Rome in perpetual turmoil and disorder from 100 B.C. till his death in 91 B.C. Though identified by birth and sympathy with the patricians, Drusus, to win the people, renewed some of the most liberal measures of the Gracchi, and carried agrarian and frumentarian laws. During the latter years of his life, he contrived to gather into his own hands the threads of the various political movements which resulted in the social war; but his almost incredible pride and arrogance had made him so many enemies, that his death, in the flower of his age, was regretted as little by his friends as by his foes. 3. The most illustrious of the Drusi was Nero Claudius Drusus, commonly called Drusus senior, the stepson of the emperor Augustus, and younger brother of the emperor Tiberius. He was born in 38 B.C., and as he grew up, developed splendid personal qualities as well as the highest capacity for civil and military affairs. He began his public career in 19 B.C., and signalized himself when only 23 years old by his defeat of the Rheti and other Alpine tribes which infested the n. of Italy. In 13 B.C., he was sent into Gaul, then in revolt, and, after crushing the rebels there, pushed across the Rhine in pursuit of their German allies. In this campaign he subdued the Sicambri and Frisii, and forced his way to the German ocean, being the first Roman general who had done so. From this time he made the business of his life to establish the Roman supremacy in Germany, partly by conquest, and partly by the execution of great military works. Among these latter may be mentioned the canal joining the Rhine with the Yssel, the two bridges over the Rhine itself, and the embankments of the Vahalis, the Waal. In 11 B.C., he conquered the Usipetes, the Cherusci, and the Suevi; in the following year, the Chatti, the Nervii, and was prosecuting the work of subjugation in 9 B.C., when a fall from his horse cut short his brilliant career in his 30th year. For his exploits in Germany, D. was rewarded with the title of Germanicus, but care must be taken not to confound him with the celebrated Germanicus, his own son. See GERMANICUS.

DRUSUS CÆSAR, usually called Drusus junior, d. 23 A.D.; and son of Tiberius by his first wife. He was made quaestor in 10 A.D., consul in 15 A.D., but degraded the office by his excesses, and his father sent him with the army to Illyria. In 22 A.D., he was made *tribunicia potestas*, and looked upon as heir to the throne. Deeming Sejanus to be his rival, Drusus struck him in the face; whereupon Sejanus persuaded Livia, the wife of Drusus, whose affections Sejanus had beguiled, to poison him.

DRUSUTHURM, THE, is the name of the principal tower of an old ruined castle near Bingen, Germany. The castle was built by Drusus, and is located on the Rochusberg. It was known during the Middle Ages as the Klopp castle.

DRY ADS, an inferior order of deities in the mythology of Greece. Their name is derived from the Greek word for an oak-tree (*drus*). They were looked upon as the guardians of the larger kinds of forest trees, along with which they came into being, and with which they died.

DRYDEN, a tp. of Tompkins co., N. Y.; including Dryden vill., Etna, and Freeville; situated on the Auburn branch of the Reading system. It has a large woolen factory, a tannery, and sulphur springs; a resort for invalids. Pop. '90, 4043.

DRYDEN, JOHN, was b. at Aldwinckle, in Northamptonshire, on the 9th Aug., 1631. His father, Erasmus Driden, was the third son of sir Erasmus Driden, created a baronet in 1619. D. received the rudiments of his education at Tichmarsh, and was afterwards admitted a king's scholar at Westminster school, under Dr. Busby. Here in 1649, he wrote an *Elegy on the Death of Lord Hastings*, and some commendatory verses on the *Divine Epigrams* of his friend John Hoddgesdon; both of which performances were published in 1650. In May, 1650, he was elected to a scholarship in Trinity college, Cambridge; he took the degree of Bachelor of Arts in 1653-54; and was made Master of Arts in 1657. His father dying in 1654, put him in possession of an estate worth £60 per annum, of which sum his mother had life-interest in a third. After leaving the university, he proceeded to London, under the patronage of sir Gilbert Pickering, who was faithful to the protector, and seems to have aroused for the time the same feeling in his protégé, whose first poem of importance was entitled *Heroic Stanzas on the Death of Cromwell*. On the return of Charles II., D., with equal splendor of diction, and perhaps with equal sincerity, congratulated the restoration.

The publication of a poem, entitled *Astræa Redux*, led to a breach between the poet and the family of sir Gilbert Pickering, and he now became author by profession. He turned his attention to the stage, planned *The Duke of Guise*, and wrote his first acted play, *The Wild Gallant*. In Dec., 1663, he married a daughter of the first earl of Berkshire, with whom he received a portion; and in 1670, he was appointed poet-laureate and historiographer, with a salary of £200 a year. He afterwards entered into an engagement with the theaters to supply them with three plays each year, for which he was to receive annually from £300 to £400; but as he did not fulfill his share of the contract, it is not probable that the theaters fulfilled theirs. In 1671, the duke of Buckingham produced his attack on the English heroic drama, of which D. was the head. This satirical piece was entitled *The Rehearsal*, and when it was brought on the stage, the town was amused. Although personally satirized, D. endured his castigation in silence, and, waiting his opportunity, immortally revenged himself on the witty and prodigate

duke in the *Absalom and Achitophel*. This magnificent satire arose out of the political commotions of the times, and is an elaborate defense of the king against the whig party. Charles II. is *David*; Monmouth, *Absalom*; Cromwell, *Saul*; Buckingham, *Zimri*; and Shaftesbury, *Achitophel*. Its success was amazing; it ran through five editions within the year. This great poem appeared in 1681; and enraged at its success, D.'s enemies hovered around him like a cloud of venomous gnats. In the same year he published *The Medal*. Elkanah Settle, one of the most virulent of his foes, replied with some effect; and D., thoroughly roused, issued next year the *Mac Flecknoe*, and the second part of *Absalom and Achitophel*. These satires were as overwhelming as the Italian battles of the first Napoleon; D.'s enemies were crushed forever, and he remained during his lifetime the undisputed king and lawgiver of English literature.

After the death of Charles II., D. became a convert to the Roman Catholic faith. This event was announced to the world by the publication of *The Hind and Panther*, in 1657. For this change of faith, he has been much abused. Macaulay calls him "an illustrious renegade." Mr. Bell, one of his biographers, strenuously defends his conscientiousness. At the revolution, he was deprived of his laureateship, and somewhat straitened in circumstances, he fell back upon his old occupation of writing for the stage. His translation of *Virgil* was begun in 1694, and completed by the close of 1696. A month after the publication of *Virgil*, appeared the *Ode on Alexander's Feast*. In 1698, he commenced his *Fables*, and completed them in a year and a half. His last work was a mask, with prologue and epilogue. He died on the 1st May, 1700, and was buried in Westminster abbey, where a monument was erected to his memory by John, duke of Buckingham.

Although the great bulk of D.'s works are composed of plays, and although these are, for the most part, devoid of character, feeble in sentiment, false to all external nature, and exaggerated in expression, he remains one of the prime glories of English literature. His *Satires* and his *Fables* are masterpieces. In these, he is almost always masculine and natural, and his versification flows on broad, deep, and majestic. Nor is it only as a poet that he excels; his prefaces and *Essays on Dramatic Poesy* prove him to be a master of "that other harmony of prose." His works in 18 vols. were edited by Scott.

DRYING-MACHINES. The ordinary process of drying clothes and fabrics by exposure in the open air, has been found too tedious for the bleacher, dyer, and for large laundry establishments; and hot-air chambers have been extensively used; but a great improvement has been lately made by using the principle of centrifugal force to throw off the greater part of the moisture. The drying-machine commonly used consists of two drums or cylinders open at the top, the inner one, into which the goods are packed, is perforated at its sides, and made to revolve with great velocity either by steam, water, or hand-power. The action of the drying-machine is precisely the same in principle as that witnessed when the housemaid is *trundling* a mop, or of the dog when he shakes himself on coming out of the water. The use of the outer cylinder is merely to catch the drops of water thrown out, and prevent the inconvenience that would result from its distribution through the apartment. A pipe connected with this outer drum carries the water away. The drying is not, however, quite completed by such machines; a very slight degree of moisture, just perceptible to the touch if the goods are pressed against the cheek, still remains. This is expelled by open-air or hot-chamber drying. These drying-machines are commonly called "extractors" by dyers. A simpler and cheaper drying-machine has been lately introduced for domestic use. It consists of two rollers mounted parallel, and one above the other, with an adjustment to vary the distances between them. One end of the article to be dried is inserted between the rollers, which are then brought as close as possible together, and one roller is turned by a handle, the other, being free to revolve, turns also as the clothes pass between them—the moisture in this case being extracted by pressure, as in the common process of "wringing."

DRYING OILS. See OILS.

DRYNESS, a technical term in painting, used to indicate a style in which the drawing is hard, angular, and formal, and the color deficient in harmony and mellowness, though not necessarily in power or richness. The earlier works, both of the Italian and Flemish schools, all more or less partake of this defect; and it is the most prominent characteristic of those of their imitators to whom the name of pre-Raphaelites has been given.

DRY'OPHIS, a genus of serpents of the family *colubridæ*, allied to *dendrophis*, and, like those of that genus, of very elongated form, and living mostly among the branches of trees, but distinguished by a projecting muzzle—a curious prolongation of the upper jaw, which in some is slender, in some leaf-like. They are natives of the East Indies.

DRY PILE is a voltaic pile or battery consisting of numerous sheets of paper covered with zinc foil on one side and black oxide of manganese on the other. Various modifications of the above form are also known by the same name. Following the invention of Volta, Behrens constructed a pile in which paper was used instead of moistened cloth, in consequence of which it was called a dry pile. The term dry pile is really a misnomer, as the pile is inactive unless the paper contains a certain amount of moisture. Behrens's construction was modified and improved by Zamboni, who gave it the name of Zamboni's pile. This was made of so-called gold and silver paper, the former being

coated on one side with copper foil and the latter with tin. The couples were made of small discs of the coated paper placed together with their metallic sides outwards and these were piled up to the number of a thousand or more, with the copper of every pair facing in the same direction. The entire pile was then firmly pressed into a glass tube, varnished with shellac, and finally covered on the ends with brass caps. These were made with as many as 20,000 pairs of discs and were capable of charging a thin Leyden jar of 350 sq. cm. surface in ten minutes to such an extent that its discharge melted 2.5 cm. of platinum wire of .05 mm. diameter.

The dry pile has been employed by Bohnenberger in the construction of a very delicate gold-leaf electroscope. For this purpose the dry pile was constructed in two columns connected together below, so that the poles were at the upper ends. Between these poles a single gold leaf was suspended. If the connection between the lower ends be connected to earth, one pole will always be positive and the other negative. A very slight charge given to the gold leaf is sufficient to make it move to the positive or negative pole of the dry pile. The dry pile has also been applied to the construction of a perpetual motion electric pendulum. The dry pile is divided into two columns, in the same way as in the electroscope just described, and between them a very light pendulum rod is set on knife edges which are placed very close to the centre of gravity of the rod. On the upper end of the rod is a light metal ring which oscillates between the two poles. The pendulum inclines first to one side and the ring touches one pole by which it is charged. This repels the pendulum and carries it to the opposite pole where the charge is neutralized and it receives a charge of the opposite polarity which reverses its motion. This action is repeated indefinitely.

Such a pendulum has been in continuous motion in the University of Innsbruck since 1823. The period of its oscillation varies slightly with the humidity of the atmosphere. The energy expended is exceedingly minute, as no pile can generate a sensible current except by a corresponding consumption of its materials in the shape of chemical action.

DRY-POINT, a sharp etching-needle, used to incise fine lines in copper, without the plate being covered with etching-ground, or the lines bit in by acid. See **ENGRAVING**. The work produced by the dry-point is not only very delicate, but it wears less in printing than lines produced by the action of acid. Fairholt's *Dictionary of Art Terms*.

DRY PROCESS. See **PHOTOGRAPHY**.

DRY ROT, a kind of decay, often very rapid, to which timber is subject, without the presence of much moisture. It has proved ruinous to many valuable edifices, and has been the cause of many serious accidents. The ends of joists are often affected by it, so that upon being burdened with even a slight additional load, they are ready to break off by the wall; and the process of destruction has often gone far without a suspicion being entertained of anything wrong. Dry rot is occasioned by *fungi*, the *mycelium* of which diffuses itself through the substance of the timber, destroying its texture, and reducing it to a fragile or even friable mass. *Merulius lacrymans*, *M. vastator*, and *polyporus destructor* (see **AMADOU**), are species very commonly productive of this mischief; the first being the most common and formidable dry-rot fungus in Britain, and the last having the same pre-eminence in Germany. Its German name is *haussehimm*. Other fungi, however, produce the same effects where none of these are present; but besides the species which are well ascertained, there are some forms of mycelium not unfrequently occurring as dry rot, of which it is uncertain to what fungus they ought to be referred, as they have not been observed to develop themselves in any perfect form, whilst also it is not known what different modifications of appearance the mycelium of the same fungus may exhibit in different circumstances. Very destructive ravages have been ascribed to different species of *sporotrichum*, particularly in the naval yards of Britain; but the genus is altogether a doubtful one, and not improbably consists of mere forms of undeveloped mycelium. Several species of fungi are often present together in timber affected with dry rot. Some of them penetrate deeply into the substance of the timber, others spread more superficially, but attract moisture from the atmosphere, which hastens decay. This is the case with *merulius lacrymans*, which first appears in small white points; a filamentous substance, radiating from these, gradually forms broad patches, sometimes many feet in diameter; from these, long creeping shoots often proceed, and a net-work of filaments penetrates into every crevice. The species of *polyporus* more generally fill the whole mass of the timber with delicate filaments, which destroy the cohesion of its fibers. *Dedalea quercina* appears in the form of leathery laminae, often in the strongest oak, and the delicate threads of mycelium penetrate every duct and cavity, reducing the whole to a fungous mass. Beautiful orange tufts sometimes appear, supposed to be the mycelium of species of *coprinus*.

Of the causes of dry rot, stagnation of air, as behind a wainscot or under a floor, is certainly one of the chief, and a knowledge of it suggests means of prevention which may often be easily and most advantageously employed. Another principal cause is insufficient drying of the timber itself; and much of the prevalence of dry rot is not improbably due to the practice of felling oak in spring for the sake of the bark, when the wood is full of sap. Any circumstance which may tend to render the sap acidulous, greatly increases the liability to dry rot. The production of fungi takes place with unusual rapidity when by fermentation or otherwise an acidulous condition of organic substances is produced. A fermentation and chemical change in the albuminous constituents of the wood, is not improbably the immediate cause of dry rot, providing a soil suitable for the vegetation of fungi.

For the prevention of dry-rot, various processes have recently begun to be employed, the object of which is to fill the pores of the wood with some chemical substance, sir William Burnett used chloride of zinc; Mr. Bethell used creosote; and Mr. Payne, lime, with silicate of potash. The process most generally approved, and apparently most successful, is that of Kyan, called *Kyanizing* (q.v.), in which a solution of corrosive sublimate is introduced into the pores and cells of the timber by means of an air-pump. The salts of mercury have been found to be more unfavorable to the development of fungi than any other chemical substances.—But without the use of any such means, we have abundant evidence that well-seasoned timber, in favorable circumstances, may remain unassailed by fungi for many centuries. England contains structures of which the timber is known to be nearly 1000 years old; wood in a state of perfect preservation was brought by lord Elgin from behind the frieze of the Parthenon, where it must have been placed more than 2,000 years ago; and the British museum contains a block of charred wood found by Layard at Nineveh. See *illus., Mosses, etc.*, vol. X.

DRY STOVE, in gardening, a hot-house in which the air is kept less moist than in the bark stove. In structure and in management, except that the temperature is kept higher, it agrees more nearly with the green-house. The dry stove is particularly adapted to succulent plants. As free admission of air is allowed in the dry stove as is consistent with the maintenance of the temperature.

DRY TORTUGAS, the extreme south-western islets of the Florida Keys in the gulf of Mexico; 120 m. w.s.w. of the s. extremity of the mainland. They are of coral formation, low, and generally barren, though some are covered with mangrove bushes. Fort Jefferson, on one of them, was a penal station during the war of the rebellion. On the same island is a lighthouse. They are included in Monroe co. Florida.

DUAL, in grammar, is the form given in some languages to a noun or a verb, when only two things are spoken of. Thus, in Greek, *pater* is father; *patere*, two fathers; *pateres*, fathers. To have a dual number in addition to a plural is often spoken of as a refinement of language. It argues, however, a higher degree of abstraction to be able to conceive every subject as one, or more than one, than to require three classes—one, a pair, and more. Accordingly, it is only in some of the more ancient languages that we find traces of a dual number, and it becomes lost as the power grows of analyzing concrete impressions. Sanscrit, ancient Greek, Arabic, and Hebrew, have the dual number, the last only in nouns. Modern Greek has lost the dual. The only trace of it in Latin is in the two words *duo*, two, and *ambo*, both. It is wanting in the Germanic languages, with the exception of the ancient Gothic, which had a dual form of the verb. In Anglo-Saxon, there was a separate form of pronoun for "we two" (*wit*) and "ye two" (*git*).

DU'ALIN, an explosive preparation of nitro-glycerine and sawdust, intended to diminish the danger in the transportation and storage of nitro-glycerine.

DUALISM is the name given to a philosophical theory, according to which some two principles, of different nature, original, and incapable of being derived the one from the other, lie at the bottom of everything; as, for example, the ideal and the real, or the material and the thinking substance. In a narrower and theological sense, dualism means the assumption of two original beings, a good and an evil, as in the doctrine of Zoroaster; or of two distinct principles in man, a bodily and a spiritual. The opposite of dualism is monism. See **ZOROASTER**.

DUANE, JAMES, 1793-97, b. N. Y.; a lawyer and a leader in the revolutionary war. He was a member of congress, 1774-77 and 1780-82; was the first mayor of New York after the revolution, and late in life was U. S. district judge.

DUANE, JAMES CHATHAM, an American military engineer, was b. in Schenectady, N. Y., June 30, 1824, graduated at West Point in 1848, where he was assistant instructor until 1854, after which he constructed fortifications for two years, was light-house inspector for two years. He served with distinction in the Civil War, and retired 1888 and became commissioner of Croton aqueduct the same year.

DUANE, WILLIAM, 1760-1835; b. N. Y.; politician and journalist. He began journalism in India about 1784, but was sent back to England because of criticisms on the government, and his large fortune was confiscated. In London, he was for a time editor of the *General Advertiser*. In 1795 he came to Philadelphia, and took the editorial chair of *The Aurora*, the organ of the Jeffersonian democracy, making it one of the most vigorously abusive journals in an abusive age. On one occasion he was mobbed and savagely beaten by a party of federalists. In 1822, he left the editorial chair and traveled in South America, and on return published an account of his wanderings. He served in the war of 1812. He wrote several works on military subjects.

DU BARRY, MARIE JEANNE GOMARD DE VAUBERNIER, Comtesse, favorite of Louis XV., was b. Aug. 19, 1746, at Vaucouleurs. Her mother was a dressmaker, and her father, or rather her reputed father, was an exciseman named Vaubernier. When fifteen years of age she went to Paris, and met there the comte Jean Du Barry, who made her his mistress. This person afterwards introduced her to Lebel, valet-de-chambre of Louis XV., who presented her to his royal master, then nearly 60 years of age. She was at this time remarkably handsome, to some extent witty, and had a frankness or, it might be, a vulgarity of manner that amused the doting monarch.

Desirous that *la petite Lange* should obtain a title, and be introduced to court, Louis prevailed upon comte Guillaume Du Barry, brother of the comte already mentioned, to marry, and thereby confer his title upon, the favorite. Accordingly, in 1769, she was presented to court as the comtesse Du Barry. After this period, many of the most powerful courtiers abased themselves before her. D'Aiguillon became her confidant, and in concert with her, ruled the doting king; the chancellor Maupeou claimed a remote relationship with her, and by her influence succeeded in dismissing and exiling the parliament in 1771; the abbé Terray, comptroller-general of finance, was *suave* to her, though insolent to all the rest of France. At no period, perhaps, was the court of France more openly and outrageously immoral than during the supremacy of this strumpet. On the death of Louis, however, in 1774, Du B. was dismissed from court, and sent to live in a convent near Meaux. She was afterwards removed to her residence of Luciennes, and while living there was allowed a pension by Louis XVI. Some time after the outbreak of the revolution, she went to London to dispose of her jewels. On her return, Robespierre caused her to be arrested, July, 1793. In Nov., she was tried before the revolutionary tribunal, and accused of "having wasted the treasures of the state, of conspiracy against the republic, and of having, in London, worn mourning for the late king." She was condemned to death, and was sent to the guillotine 7th Dec., 1793. Of all the women who mounted the scaffold during the revolution, Du B. exhibited the least courage. She implored the "good people" to deliver her, and Monsieur the executioner to prolong her miserable life for one moment only. The single good thing that history records of her, is her patronage of various artists and men of letters, but there is little reason to believe that it originated in anything higher than her dread of epigram and caricature. She had neither taste nor knowledge, and cared only for sensual gratifications and excitement. It is estimated that she cost France 35,000,000 francs. The *Mémoires* published under her name (6 vols., Par. 1829-30) are not reliable. The only work, it seems, which can be consulted with confidence is Lacretelle's *Histoire de France pendant le 18^{me} Siècle*.

DUBITZA, a fortified t. situated on the northern frontier of Bosnia, on the right bank of the Unna, and at a point about 10 m. from its confluence with the Save, of which it is a tributary. During the 16th and 17th c. it was a bone of contention between Austria and the Porte, and was repeatedly lost and regained by the latter. It is chiefly notable, however, for its heroic but unavailing resistance to the Austrians in 1788. Pop. about 3,000. D. was subsequently restored to the Turks; but became Austrian, 1878. Over against Turkish D., on the opposite bank of the Unna, stands Austrian Dubitza, a strongly fortified market town in Austrian Croatia. Pop. '90, 3,379.

DUBLIN, a maritime co. in the e. of Leinster province, Ireland, and containing the metropolis of that country; bounded, n., by Meath; e., by the Irish sea; s., by Wicklow; and w., by Kildare and Meath. It is the smallest but two of the Irish counties, being 32 m. long and 18 (average 12) broad; area, 354 sq. m. The coast, from its indentations with creeks and bays, is 70 m. long, and off it lie several isles. Dublin bay, one of the finest in the kingdom, is 6 m. broad, 6 deep, with a sweep of 16 miles. Besides this there are the bays of Killiney, Rogerstown, Malahide, and Lough Shinney, and the artificial harbors of Howth, Balbriggan and Kingstown. It has two precipitous hills, about 500 ft. high at its n. and s. ends; but the head of the bay is low and sandy. The coast is defended by 26 martello towers. The surface is mostly a level rich plain, with slight undulations, but rising in the s. in a hill-range, the highest point of which is Kippure, 2,473 feet. N. of this range, the only prominent eminences are Lambay isle, or Ireland's Eye, and Howth Head, 503 feet. The only river of note is the Liffey, which runs through Dublin city into Dublin bay. The Royal and Grand canals run w. through the co., and unite the Liffey and the Shannon. The chief rocks are carboniferous limestone, granite, and some metamorphic rocks and greenstone. There are copper and lead mines near Scalp. Fuller's-earth and potter's-clay occur. Iron and manganese are found on Howth peninsula. Granite and limestone are much used in building. There are many mineral springs, including 10 saline purgative ones, within the city of Dublin, and some tepid ones of 75° F. The climate is mild. The soil is generally a shallow calcareous gravelly clay. In the n. and w. are grazing and meadow farms, and around Dublin city, villas, kitchen-gardens, dairies, and nurseries. The county contains three cromlechs, one to the south of Killiney, one at Howth, and one at Brennanstown. There are also some ancient round towers, and at St. Dawlagh's is a curious church with a stone roof. D. is the best cultivated co. in Ireland. The chief crops are oats, wheat, potatoes. There are important fisheries, along the coast, of turbot, brill, sole, plaice, cod, ling, haddock, whiting, and oysters. The manufactures (chiefly of cottons, stockings, and embroidered muslins) are mostly confined to the city and the vicinity of the metropolis, and are of more value than in any other Irish county. Balbriggan is famed for its hosiery. The chief exports are from Dublin city. The chief towns are Dublin, the capital of Ireland, and Kingstown. The co. sends eight members to parliament—two for D. co., four for Dublin city, and two for Dublin university. The manners, appearance, dress, and cabins of the lower orders in D. co. differ less from those of the interior of Ireland than would be expected. There are numerous antiquities in different parts of the county. Pop. 1891, 429,216.

DUBLIN (Irish, *Dubh-linn*, "black pool;" the *Eblana* of Ptolemy), the capital of Ireland, stands on the river Liffey, where it disembogues into Dublin bay, in lat. 53° 20' 38" n., and long. 6° 17' 30" west. It covers an area of 1300 acres, but its parliamentary boundary comprises an area of about 5,000 acres, and its municipal boundary nearly 4,000 acres. Much of D. is built on land reclaimed from the sea, a work which still continues; and the ground is generally flat, with a very few undulations, scarce deserving the name of hill. The river, running from w. to e., divides the city into two almost equal portions. The aristocratic parts are the s.e. and n.e., containing many beautiful squares, with splendid streets and terraces. The center, and the n.w. quarter are the great emporiums of trade, and the residence of the middle classes, many of whom, however, have their private houses in the suburbs. The s.w. division, part of which is called the "Liberties," once the seat of the silk trade, is the most filthy and degraded portion of the city. The streets in this quarter are narrow, crooked, and irregular, while in the fashionable portions they possess a totally opposite character. The city is surrounded by a "circular road" of nearly 9 m. in length, forming a favorite drive and promenade.

In the newer parts of D., the streets run at right angles to one another, and are remarkable for their breadth and the uniformity of their architecture, which, however, is so varied as to avoid monotony. The most imposing one is Sackville street, which is 120 ft. broad, and nearly 700 yards long; at its n. end stands the rotunda, with Rutland square—in its center, the beautiful Ionic portico of the general post-office, and Nelson's monument (upwards of 130 ft. high)—while on the s., it is terminated by Carlisle bridge, and a wedge-like block of noble houses formed by the converging sides of Westmoreland and D'Olier streets. A peculiar feature of D. is its squares, which are very numerous, spacious, and well kept. Stephen's Green is about a mile in circuit. Somewhat smaller, but more elegant and aristocratic, is Merrion Square (13 acres). The large park and squares of Trinity College occupy more than 40 acres. An electric street railway was opened in 1896.

The public buildings of D. are famed for their number and grandeur, and appear to more advantage since the dwelling-houses are built of brick. In the first class may be mentioned the bank of Ireland (formerly the house of parliament), Trinity college, the custom-house, and the four courts, which, from the chasteness of their design, and the massiveness of their proportions, have a very imposing effect. The castle has no pretensions to architectural beauty. There are monuments of William III. in College Green (once a *green*, but now a paved street); of Nelson, the duke of Wellington, Goldsmith, Burke, Grattan, and many others in various public sites. The benevolent and charitable institutions of D. are very numerous, and are liberally supported.

Within the limits of the circular road, the Liffey is crossed by several stone and iron bridges, and throughout the whole extent of the city the banks of the river are faced with granite walls and parapets. On each side of these "quays" there is a spacious roadway, with tall houses and excellent shops. The quay proper extends eastward from Carlisle bridge. Near the custom-house, there are several large docks for the accommodation of vessels from distant ports with excisable cargoes, and in communication with the Royal and Grand canals; the former connecting Dublin with the North Shannon and the w. of Ireland, the latter with the s. portion of the same river and the south. A very spacious dock, the "Spencer dock," was opened in 1873; and the harbor has been much improved in late years by the completion of two large breakwaters, the n. and s. walls. There is a bar at the mouth of the harbor, but even there the least depth at low tide is about 11 feet.

The chief manufacture of D. is poplin, which is much celebrated. This, with some glass-works, cotton and linen factories, foundries, distilleries, breweries, and those workshops which are necessary to supply domestic wants, are the main branches of industry. In this regard, D. has been much more of a capital, and less of a manufacturing and export city than London; but a considerable change in the industrial character of the city has been going on for several years. The direct foreign trade, though increasing, is very limited, Glasgow, Liverpool, and Bristol intercepting the greater portion of it. Much of the inland traffic is carried on by the canals above mentioned, and by the railways (now extending to all parts of Ireland), and consists principally of articles of dairy and farm produce from the central counties. The principal banks are the Bank of Ireland, the Royal, the National, Provincial, Hibernian, and Munster, with some private establishments.

The great educational institution of D. is Trinity College and university. See DUBLIN, UNIVERSITY OF. There is also a Catholic university, the medical school of which has been very successful. In regard to schools, D. is not well supplied. The education of the upper and middle classes is left chiefly to private enterprise. For the humbler classes, much has been done by the national board (whose model schools are attended by large numbers of children), by the church education society, the Christian brothers, and Catholic brotherhoods and sisterhoods, and other agencies. There are many literary and scientific societies, dealing with subjects of general knowledge, or with matters of local or national interest. There are two botanic gardens—one at Glasnevin, belonging to the royal Dublin society, and one near Donnybrook, connected with the university. The hospitals, asylums, orphanages, and other charitable institutions are numerous, and liberally maintained.

The municipal affairs are under the control of a town council, which consists of a lord mayor, aldermen, and councilors. There is a large police force, which has charge of the city and of all the surrounding country as far as 8 m. from the castle. The city sends four members to parliament. The population of the municipal borough in 1871 was 246,326, of whom 195,180 were Roman Catholics, 39,897 Episcopalians, 4,517 Presbyterians, and the rest of other denominations; of parl. bor. 267,717. Pop. of municipal borough, '91, 245,001; of parliamentary borough, 269,700; and of the metropolitan police district, 361,891.

The environs of D. are especially beautiful. Rathmines, a southern suburb, has become a large township, and is the favorite residence of the wealthier part of the mercantile community. Glasnevin, on the n., deserves special notice as the favorite residence of the poet Tickell, of Addison, Steele, Parnell, Swift, Sheridan, and many other celebrated men. In the cemetery at Glasnevin lie the remains of Curran, O'Connell, and Tom Steele. The Phoenix park is a magnificent area of nearly 2,000 acres, in some parts level, in others with broken ground, having a large amount of timber and brushwood, which shelter immense herds of deer. It affords ample scope for military reviews, and is most extensively used by the inhabitants of D. of all classes for recreation. D., as a whole, with its magnificent bay—which has often been compared to the bay of Naples—splendid park, massive public buildings, wide streets, spacious and well-kept squares, clean and elegant quays, and beautiful environs, is one of the most handsome and delightful capitals of Europe.

There are numerous places of worship, Catholic and Protestant, monasteries, convents, friaries, and a Jewish synagogue. The most remarkable among the Protestant churches are St. Patrick's cathedral, restored by the munificence of a single individual, and Christ church, which has also undergone restoration; and among the Catholic, St. Mary's, St. Saviour's, St. Augustine's, St. Kivin's.

The lord-lieutenant of Ireland, of late oftener known as the viceroy, holds his court in Dublin castle during the winter months, and in the summer season removes to the lodge, situated beyond Phoenix park.

DUBLIN, UNIVERSITY OF. The first university of Dublin was established in connection with St. Patrick's cathedral in 1320; but for want of proper endowments, it never prospered, and dragged out a miserable existence till, probably, the dissolution of the cathedral by Henry VIII.

Foundation.—The existing university was founded in 1591–92, and stands in the position of being a college with university powers. Trinity college, indeed, was intended merely as the *nucleus* of a university, but as no colleges have since been added, it remains in undisputed possession of all university privileges. Queen Elizabeth provided the charter, the corporation of Dublin bestowed the ground and ruins of the suppressed monastery of All-Hallows, and the Irish gentry supplied by subscription the funds necessary for the erection of the buildings. The income of the college was very limited and very precarious, till James I. endowed it with certain estates in the province of Ulster, and a yearly pension of £388 15s., English money, from the public purse.

Constitution.—By queen Elizabeth's charter, the corporation was to consist of a provost, three fellows, and three scholars, in the name of more, with the power of purchasing, taking, and possessing any manors, tenements, etc., from the sovereign, or from any other person. On a vacancy in the provostship, the fellows were entitled to elect a fit successor, and the election of fellows and scholars lay with the provost and fellows. The provost and fellows had full powers to enact statutes, confer degrees, and prescribe the necessary exercises for graduation, and to do all the work of tuition. Defects soon began to show themselves in this constitution, but they were remedied by the new statutes of archbishop Laud, which were definitely published in 1637, and which are in the main still in force. By these the election of provost was given to the crown.

Parliamentary Representation.—In 1613, James I. conferred on the university the right of sending two members to the Irish parliament. One of these was taken away at the union in 1800, but was again restored by the reform bill of 1832. The electors were formerly the provost, fellows, and scholars; but, in 1832, the privilege was extended to masters of arts, and those of higher degree.

Board.—The provost and senior fellows form the board of management of the college. They meet every Saturday, and transact all the financial and other business.

Council.—By letters-patent of 1874, a council was established to co-operate with the board in the regulation of the studies of the university, and in the appointment and regulation of the tenure of office and duties of professors. This council consists of 17 members—namely, the provost of Trinity college, 4 members elected by the senior fellows, 4 elected by the junior fellows, 4 by the professors, and 4 by the senate of the university.

Officers.—The government and working of the university are intrusted to the following officers: the chancellor, vice-chancellor, provost, two proctors (one chosen from the senior, and one from the junior fellows), a senior lecturer (who regulates the public examinations), two deans, and a censor, a librarian, registrars, an auditor, professors, and examiners.

Senate.—The chancellor (or, in his absence, the vice-chancellor or *pro vice-chancellor*), all masters of arts, and doctors of the three faculties, whose names are on the college books, form the senate of the university. The senate elects the chancellor, and confers degrees.

Caput.—The caput of the senate consists of the chancellor, vice-chancellor, provost (or vice-provost), and senior master *non-regent*, who is chosen by the senate. Every *grace* (for the bestowal of a degree) must first receive the sanction of the provost and senior fellows, be afterwards approved of by the caput (each member of which has a *negative vote*), and finally be confirmed by the senate in public congregation.

Provost.—The provost, who is appointed by the crown, may be a layman, of any religious denomination. He enjoys an income of about £3,000 a year.

Fellows (Senior).—The fellows are all chosen, in the first instance, by examination; but the seniors are promoted from the juniors, in order of seniority. They have no stated duties, except those connected with the general management of the college affairs. The average income of a senior fellow, from all sources, is about £1380 per annum.

Fellows (Junior).—The junior fellows are elected by examination. They form the great teaching staff of the college, and do all the duties of lecturing and examining the undergraduates. Most of them are tutors, and their income, which may average £600 a year, is derived partly from a salary given by the college, and partly from their duties as tutors, lecturers, and examiners. Fellowships were formerly tenable only by members of the Episcopal church, but by the recent act all such religious restrictions were abolished. The number of the junior fellows has been altered from time to time, but by a queen's letter, issued some years ago, it was fixed at 23—the then number of 27 being gradually reducible. The law of celibacy, imposed in the reign of Charles I., was repealed in 1840.

Professors.—There is a very complete staff of professors, who represent almost all subjects of human knowledge. Besides a full complement of lecturers in divinity, natural philosophy, mathematics, law, and medicine, there are professors of ancient, oriental, and modern languages (Irish, Arabic, and Sanscrit being among the number), moral philosophy, oratory and English literature, modern history, political economy, natural history, botany, geology, mineralogy, civil engineering, etc.

Scholars.—The scholars, 70 in number, are elected from among the undergraduates. They are members of the corporation, and have the university franchise. Scholarships (which are tenable for five years) are gained by public competition—some being assigned for classics, and others for science; the provost and senior fellows, assisted by some of the junior fellows or professors, if desired, are the examiners. The various emoluments of a scholar, arising from salary, remission of fees, rooms, commons, etc., amount to about £50 per annum. There are also minor scholarships for the encouragement of the study of divinity and of the Irish language; while others are connected with the royal and endowed schools. Forty exhibitions of £25 per annum each, tenable for two years, have been recently founded, 12 of which are given in each year to students immediately after entrance, and 8 to those who have concluded their second year.

Students.—There are four grades of students. 1. Noblemen, sons of noblemen, and baronets, who have certain special privileges; the first two being allowed the degree of *B.A. per specialem gratiam*. 2. Fellow-commoners, who dine at the fellows' table. 3. Pensioners, who form the great body of the students. 4. Sizar, who have rooms and commons free. The sizars are limited to 30; they are elected by competitive examination, and hold their sizarships (worth about £37 per annum) for four years. Each rank has a dress peculiar to itself.

Entrance.—Students are admitted to the college after an examination in a prescribed course of classics, arithmetic and algebra, English history and composition, and modern geography. The honor of *first place* at entrance examination is keenly contested; and there are, besides, prizes awarded for excellence in special branches of the entrance course, and also for Hebrew.

Tutors.—Each student must at entrance place himself under one of the 18 junior fellows who are tutors. These stand to their pupils *in loco parentis*, and have charge of their tuition, though each tutor does not necessarily teach his own pupils.

System.—To proceed to the degree of A.B., a student must keep terms for four years, two terms at least being necessary in each year. Terms may be kept either by residence, and attendance on lectures, or by simply appearing on a stated day in the public hall, and passing a creditable examination in a prescribed course. Lectures are delivered on the different subjects of each term examination by the tutors, the honor examiners, and the university professors; and prizes of the value of £4 and £3 are awarded at the Michaelmas examination to the *first* and the *second* honor men respectively. In the other terms (Hilary and Trinity), parchment certificates reward the diligent. At the end of the fourth year, gold and silver medals are awarded to the senior and junior moderators. Students of the first year are called junior freshmen; those of the second, senior freshmen; of the third, junior sophisters; and of the fourth, senior sophisters. All students must pursue the following course: *first year*, Latin, Greek, mathematics; *second year*, Latin, Greek, mathematics, logic, and metaphysics; *third year*, Latin, Greek, physics, logic, and metaphysics; *fourth year*, Latin, Greek,

physics (both mathematical and experimental), astronomy, and ethics. For those who aspire to honors, the course is much more extensive than that for mere *pass*.

Degrees.—Term examinations having been duly passed, the student is promoted to the degree of A.B., which is conferred by the senate in full congregation. The *comitia* for granting degrees are held on Shrove Tuesday and the last Wednesday in Trinity and Michaelmas terms. Those students who, at the final ordeal of the fourth year, stand highest in an examination over an extra course in (1) mathematics and mathematical physics; (2) classics; (3) mental and moral philosophy; (4) experimental science; (5) natural science; (6) history and political science; (7) modern literature, are called (according to merit) senior or junior moderators. These form the first class of graduates, the second being called respondents. The third consists of "unclassified candidates." The higher degrees are procurable after the lapse of a fixed number of years, and on the performance of certain exercises, and the payment of fees.

Fees.—For entrance and first half-year the fees are—Noblemen, £60; fellow-commoner, £30; pensioner, £15; sizar, £5 1s. 3d. Other half-years, £33 12s., £16 16s., and £8 8s.—the sizars being exempt. This does not include robes and commons. For degrees, the fees for pensioners are—A.B., £8 17s. 6d.; A.M., £9 16s. 6d.; LL.B., £11 15s.; LL.D., £22; B.D., £13 15s.; D.D., £26; M.B., £11 15s.; M.D., £22.

Divinity, Medical, and Engineering Schools.—Connected with Trinity college there are schools for medicine and engineering. The Divinity school of the church of Ireland is also in connection with the university. Graduates in medicine and in engineering must previously graduate in arts. The divinity testimonium is obtained after two years' attendance on lectures, with an examination at the end of each term.

Church Patronage.—The university formerly held a large and valuable patronage, but this has been abolished by the recent church act.

Studentships.—In 1859, 14 studentships were founded, worth £100 a year each, tenable for seven years, to encourage graduates in the pursuit of some special branch of study which they may afterwards be called on to teach, should they become fellows and lecturers. Two are given every year, and (like every other prize or distinction in the university, not connected with the divinity school) are open to persons of all religious denominations. They are awarded to those candidates at the degree examination who take the highest places in science and classics respectively.

Among the famous graduates are Berkeley, Sir W. Hamilton, Sheridan, Swift, Goldsmith, etc.

DUBNIT'ZA, a t. in the principality of Bulgaria, 25 m. s.w. of Sophia. It has extensive iron-works, and a pop. of about 8,000.

DUBNO, a t. in Russia, in the government of Volhynia. Its trade is chiefly in corn, flax, tobacco, fish, and cattle. A large fair is also held here at Whitsuntide. Pop. about 7,500.

DUBOIS', a co. in s. w. Indiana, bounded on the n. by White river, and having railroad connection with the Ohio; 410 sq. m.; pop. '90, 20,253. It has a varied surface, with much forest land; good soil, and abundant coal. Chief productions, wheat, corn, and tobacco. Co. seat, Jasper.

DUBOIS, a borough in Clearfield co., Pa.; on the Allegheny Valley, the Buffalo, Rochester, and Pittsburgh, the Mahoning Valley, the Pennsylvania, and the West Jersey and Seashore railroads; 19 miles n.w. of Clearfield, the county seat. It contains a high school, business college, and national bank; has electric lights and daily and weekly newspapers; and is principally engaged in coal mining and lumbering. Pop. '90, 6,149.

DUBOIS, ANTOINE, Baron, 1756-1837; a French surgeon; in 1790, professor in the royal college of surgery; one of the savants selected by Bonaparte to accompany the expedition to Egypt. It is said that at the accouchement of the empress (Marie Louise) his skill saved the lives of both mother and child. He was surgeon-in-chief of the hospital still known by his name. His publications were few, but he devised many new processes, and invented several new instruments.

DUBOIS, GUILLAUME, Cardinal, was b. 6th Sept., 1656, at Brives-la-Gaillarde, in Auvergne, where his father was an apothecary. At the age of 12, he came to Paris, and entered the college of Saint Michel, as a domestic of the principal. Here he made such good use of his opportunities for acquiring knowledge, that he was afterwards selected as tutor to the son of a merchant named Mauroy, and gradually rose till he became tutor to the young duc de Chartres. Although of an ugly exterior, he contrived, by his mixture of wit and hypocrisy, to win the esteem of the boy's mother, while he possessed the most unlimited confidence of his pupil, partly through their common love of letters, and partly because he took upon himself the odious office of pander to his vices. His public career commenced after the marriage of his pupil, in 1692, with Mademoiselle Blois, a natural but legitimized daughter of Louis XIV. He then received from that monarch, for his services in bringing about the match, a gift of the abbey of St. Just, in Picardy. He was next attached to the French embassy at the court of London, where he formed some important political connections. On his return, he became pri-

vate secretary to his old pupil; and when the latter (now duke of Orleans) became regent in 1715, D. became virtually the most powerful man in France. The great act of his life was the famous treaty signed at La Haye, 14th Jan., 1717, and known as the *triple alliance*, between England, Holland, and France. The importance of this act lies in the circumstance that it effectually changed the foreign policy of France, in spite of the French princes, in spite of the traditions of Louis XIV., in spite of the dislike of the English king for the regent, and finally, in spite of Cardinal Alberoni himself, the Spanish minister. In reward for his brilliant dexterity, D. received the office of minister of foreign affairs, and in 1720, on the solicitation of George I. of England, was appointed to the vacant archbishopric of Cambrai. In 1721, he obtained the cardinal's hat, and in the following year became prime minister of France, when his authority seemed unbounded. He died 10th Aug., 1723, a victim to hard work and the wildest debauchery.

DUBOIS, JEAN ANTOINE, 1765-1848; a French missionary in the East Indies, where he passed 32 years; author of *Letters on the State of Christianity in India*. He also contributed to the *Bulletin des Sciences*, and the journals of the Asiatic societies. His best known work was *Description of the Character, Manners, and Customs of the People of India, and of their Institutions, religious and civil*, which was published in English by the East India company, and subsequently in French at Paris.

DUBOIS, JOHN, 1764-1842; b. Paris. He graduated at the coll. of Louis le Grand; entered the seminary of St. Magloire; and was ordained priest, 1787. When the French revolution broke out, he refused to submit to its requirements and was forced to flee. Landing in Va., 1791, he was called by Bp. Carroll to Frederick, Md. He built the first Rom. Cath. church in that neighborhood, 1806, and founded Mt. St. Mary's coll. at Emmitsburg, 1809, of which institution he became pres. -In 1826 he was appointed bp. of New York.

DU BOIS-REYMOND, EMIL HEINRICH, b. 1818; a German scientist; member and perpetual secretary of the imperial academy at Berlin, imperial privy counselor, professor of physiology in the university of Berlin, and director of the physiological apparatus and of the physiological laboratory. He has made many important researches in animal electricity, and published invaluable works on that theme, and on recent progress in anatomy and physiology.

DUBOSSARI, or NOVIE DUBOSSARI, a t. in the government of Kherson, European Russia, on the Dniester, 101 m. above Odessa; pop. about 10,500. It is in a picturesque situation, surrounded with fertile fields and gardens, and has a number of important public institutions. Trade is chiefly in wine, tobacco, cattle, and grain.

DUBOVKA, a t. of European Russia, in the government of Saratov, is situated on the eastern slope of the Sarpa hills, on the right bank of the Volga, in lat. about 49° n., and long. 44° 45' east. It is a depot for goods brought from the northern provinces, which it forwards to Katschalinskala, a town about 40 m. distant from D., and situated on the Don. The produce is thence conveyed by the Don to the southern provinces. D. has some trade in wood, oil, iron, and manufactured articles. Pop. 14,500.

DUBS, JAKOB, b. 1822; a Swiss politician; studied law at Heidelberg, Bern, and Zurich; in 1847, he was elected to the grand council; afterwards to other offices in his native canton. In 1857, he was president of the federal court; and, 1864 and 1870, president of the confederation. In politics he was a liberal, and gave aid in many reforms. He is the author of a number of political works. He d. 1879.

DUBUFE, ÉDOUARD, b. Paris, 1820; studied under his father, Claude Marie, and Paul Delaroche. He successfully followed his father's sentimental style, but afterwards painted Scriptural subjects. His later work is seen chiefly in portraits, among them the empress Eugénie, Rosa Bonheur, and the members of the congress of Paris. Three of his large compositions have been exhibited in the United States—"The Prodigal Son," "The Conscript's Departure," and "The Soldier's Return." He d. 1883.

DUBUQUE, a co. in e. Iowa, on the Mississippi river, watered by branches of the Maquoketa river, and crossed by several railroads; 600 sq. m.; pop. '90, 49,848. It is hilly and well timbered, with fertile soil, producing wheat, corn, butter, etc. There is abundance of lead ore, and more than 100 mines are in operation. Co. seat, Dubuque.

DUBUQUE, city, port of entry, and co. seat of Dubuque co., Ia.; on the w. bank of the Mississippi; 337 m. n. of St. Louis, and 247 m. below St. Paul. It is picturesquely situated on a low terrace and high bluffs, and is connected with East D. on the Illinois side by two bridges, one 2000 ft. long. Steamboats run to St. Paul and to St. Louis during the season of navigation, and there are several railroads, among them the Chicago, Milwaukee and St. Paul; the Illinois Central, and the Burlington. Its lower portion, the business quarter, is 20 ft. above the water; the bluffs, on which are the residence streets, are 200 ft. high, but an inclined plane cable road connects the two parts and three electric railways. Among the buildings are the city hall, market, U. S. building, and Roman Catholic cathedral. D. is the centre of the lead region of Iowa, n. w. Illinois, and s. w. Wisconsin, and the mining industry has been revived, and zinc works established. A fine agricultural region surrounds the city, and the river commerce in produce

is large. There are national and other banks, public parks, public library, and several hospitals and asylums. The winter harbor for boats on the upper Mississippi is here. The former Roman Catholic diocese of Dubuque was created an archdiocese in 1893. Of educational institutions there are St. Joseph's college and academy, and St. Mary's academy, both Roman Catholic, the Iowa institute of science and art, a German Presbyterian divinity school, and public high school. There are manufactories for farming tools, engines, machinery, leather, bricks, lead, flour, steamboats, etc. Two gunboats for the U. S. navy were built here. The place was named from Julien Dubuque, a French Canadian, who settled on the spot in 1778. The first permanent settlement in the present State was made here in 1833, the town was incorporated 1837, and was chartered as a city in 1846. Pop. '90, 30,311.

DU CAMP, MAXIME, French author, born in Paris, Feb. 8, 1822. On leaving college, he undertook a first voyage to the Orient, and in 1849 he was sent there by the government. These two voyages were described by him in several books, illustrated from photographs taken by himself. His principal other works are: Poetical, *Chants Modernes*, *Les Convictions* (1858) and *Chants de la Matière*; novels, *Mémoires d'un Suicide* (1853), *Les six Aventures* (1857), *L'Homme au Bracelet d'Or* (1862), *Les Buteurs de Cendre* (1866); historical, *Les Convulsions de Paris* (1874-79), *Paris—ses Organes, ses Fonctions, sa Vie* (1869-75); as well as several volumes of art criticism and books of travel. Du Camp became a member of the Academy in 1880. He died in 1894.

DUCANGE, CHARLES DUFRESNE, SEIGNEUR DU CANGE, generally styled **DUCANGE**, a French author, distinguished by his historical and linguistic writings, belonged to an ancient family of Picardy, and was born at Amiens, 18th Dec., 1610. After having received the rudiments of a scientific education at the Jesuits' college in his native town, he studied law at Orleans, and in 1631 became parliamentary advocate at Paris, where he continued to reside till his death, 23d Oct., 1688. There was scarcely any branch of science with which he was unacquainted, but his favorite studies were classical philology and history. Among his historical works may be mentioned the *Histoire de l'Empire de Constantinople sous les Empereurs Français* (Paris, 1657). He also edited, along with other scholars, the *Corpus Historiæ Byzantinæ* (Paris, 1680), and Joinville's *Histoire de Saint Louis, Roi de France*. His two principal works, however, are the *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (3 vols. fol., Paris, 1678; much enlarged by the Benedictines of St. Maur, 6 vols. fol., Paris, 1733-36, to which four supplementary volumes were afterwards added by Carpentier, a Benedictine), and the *Glossarium ad Scriptores Mediæ et Infimæ Græcitatatis* (Paris, 1688). Both works display great learning, good judgment, and admirable industry, and are extremely valuable contributions to the study of the history and antiquities of the middle ages. A new edition of the Latin glossary, incorporating all the previous supplements, together with additions of his own, was published by G. A. Henschel (7 vols. 4to, Paris, 1842-53); and supplementary volumes (*Latino-Germanicum*) were added by Diefenbach (Francf. 1857 and 1867). A new edition in 10 volumes has since been issued (1883-). Ducange left a large quantity of valuable manuscripts, which have been collected in the university of Paris.

DU'CAS, MICHAEL, lived about the middle of the 15th c.; a Greek historian, of a family that gave several emperors to Constantinople. After the fall of that city he was employed in diplomatic business. He wrote a history beginning at the death of John Palæologus and extending to the capture of Lesbos in 1462, which is a valuable source of information concerning the close of the Greek empire.

DUC'AT, one of the most extensively used names for a coin, mostly of gold. Ducats were first coined in the 12th c. in Sicily, and took their name from the legend found on those early Sicilian pieces: *Sit tibi, Christe, datus, quem tu regis, iste Ducatus (ducatus means duchy)*. Such coins were extensively issued after the 12th c. in Italy, especially at Venice. Venice ducats were called *Zecchini*, from *Zecca*, where the mint was situated. The ducat was adopted in 1559 by the imperial diet of Germany into the currency of the empire, and was afterwards coined in the several German states, and over the whole of the north of the European continent, Russia included. They generally bore the likenesses of the sovereign princes. The ducat varied in weight and fineness; by far the most common, which was current in Austria, Russia, Hamburg, etc., weighed 54 troy grains, American value about \$2.30. The modern Italian ducat was of much less value. The gold ducat of Venice was valued at \$1.50. In the (late) kingdom of the Two Sicilies, the ducat (ducato del regno) was a silver coin and money of account, forming the unit of the currency, being divided into 100 grani, in the island of Sicily into 100 bajocchi. There are few silver ducats, however, in existence. The ducat = \$0.80 American. There are various kinds of the Spanish *ducado*, generally translated dollar. The *ducado de plata*, or silver ducat, hard = \$1.00.

DUCA'TO, CAPE (anciently *Leucætēs*), a headland at the southern extremity of a promontory of Santa Maura, one of the Ionian island, in lat. 38° 34' n., and long. 20° 32' east. Cape D. was in ancient times dreaded by mariners, and the modern Greek sailor still fears the strong currents and the fierce gales which he has to encounter there. A point on the western side of the *Leucadian* promontory is called *Sappho's Leap*, as it was supposed that here the poetess precipitated herself into the sea. It is a white, broken cliff, rising perpendicularly from the water to the height of about 2,000 feet.

DU CHAILLU, PAUL BELLONI, born Paris, 1835; son of a trader to the w. coast of Africa, where the boy passed some time at an early age, and acquired knowledge of the language and modes of life of the neighboring tribes, and of natural history. In 1852, he traveled through the United States, and published a series of papers on the Gaboon country. In Oct., 1855, he left New York to explore equatorial Africa, and spent nearly four years in the work, reaching to about 14° 15' east. During this trip he shot and stuffed more than 2,000 birds, of which 60 were species before unknown. He also killed more than 1000 animals, among them several gorillas, a species probably never before seen by Europeans. In 1859, he returned to the United States with his natural history specimens and a great collection of arms and domestic implements. He published an account of his trip in *Explorations and Adventures in Equatorial Africa*. He was one of the first to describe the gorilla; and the truth of his narrative was strongly attacked, and as stoutly defended, mainly by English savants. This provoked the traveler to undertake a second journey, and he sailed from England for that purpose in Aug., 1863. He went over much of his course on his first trip, but explored some new regions. In Sept., 1865, he was compelled to return to the coast in consequence of the hostility of the natives, having lost everything except his journals. This venture was detailed in *A Journey to Ashango Land*. He lectured in the United States, where he fixed his residence, and in 1872-73, made a trip in Norway, Lapland, Sweden, and Finland. Besides the works named he has published *The Gorilla Country; Wild Life; Lost in the Jungle; The Land of the Midnight Sun; The Viking Age*. In 1893 he was presented with a silver loving cup by the American Geographical Society for his discoveries of the gorilla, the pygmies, and the great equatorial forest.

DUCHÉ, JACOB, D.D., 1737-98; b. Philadelphia; graduate of the college of that city in 1757, completing his education at Cambridge, Eng. In 1775, he was rector of Christ church in Philadelphia. The next year he was chaplain to the first continental congress, and gave all his salary for the relief of the families of soldiers killed in the war. His courage gave out on the capture of Philadelphia by the British, 1777, and he wrote to Washington urging him to cease what seemed to be a hopeless struggle. The letter was laid before congress, and Duché fled to England, and his property was confiscated. He returned in 1790, but could not regain position or influence.

DUCHESNE, ANDRÉ (in Latin, Andreas Chesnius, or Duchenius, or Quercetanus), the father of French history, was b. at Ile-Boucharde, in the old province of Touraine, in May, 1584, and studied at Loudun and Paris. History and geography were his favorite studies from his youth, and under Richelieu's ministry he was appointed royal geographer and historiographer. He d. 30th May, 1640, by a sad accident, having been crushed against a wall by a carriage in a narrow street. His collection of the *Historiae Francorum Scriptores Coetanei ab ipsius gentis origine ad Philippum IV. tempora* (5 vols., Paris, 1636-49), is particularly important. It was continued from the third volume by his son, FRANÇOIS DUCHESNE (born 1616; died, after having likewise been appointed historiographer, in 1693), and contains much that may be sought for in vain in Bouquet's collection. Of his other numerous writings, we may mention, as deserving of special notice, the *Historiae Normannorum Scriptores Antiqui* (Paris, 1619); *Histoire Généalogique de la Maison de Montmorency et de Laval* (Paris, 1624); and *Histoire Généalogique de la Maison de Vergi* (Paris, 1625).

DUCHESNE, JACQUES CHARLES RENÉ ACHILLE, military officer, b. in Sens, France, March 3, 1837; graduated at St. Cyr in 1857; became general of brigade in 1888 and of division in 1893. He distinguished himself in the Franco-Prussian war, 1870-71, at Tonkin, 1883, and in Admiral Courbet's campaign in Formosa; subsequently commanded the infantry division at Bourges, and the 14th division at Belfort, and in 1895 was appointed commandant of the expedition which conquered Madagascar.

DUCHOBORTZI, a Russian religious sect, of the origin of which nothing is very certainly known, and which, although conjecturally referred by count Krasinski to the Patarenes (see CATHARI), cannot be traced beyond the middle of the 18th c., when it was found to exist in different parts of Russia; and its members became exposed to penalties by their refusal to serve in the army. The D. hold the doctrine of the Trinity, and are chiefly distinguished by their holding that human souls existed before the creation of the world, and fell in that former existence, from which the fall of Adam and a continual tendency to fall have proceeded; and by their ascribing hidden mysterious meanings to all parts of the Bible, for the knowledge of which they depend on inward light. They are extreme mystics. They reject the use of pictures common in the Russian Greek church. They neither observe baptism nor the Lord's supper. In their religious meetings they salute each other with bows and kisses: they pray, sing psalms, and exhort or expound the Scriptures. They are, however, generally very illiterate and ignorant. On the accession of the emperor Alexander I., they received the most complete toleration, and were allowed to settle by themselves on the bank of the Molochna in the s. of Russia. Here, however, an impostor named Kapustin prevailed on them to receive him as a prophet, taught them the transmigration of souls, and made them believe that he himself was animated by the soul of Jesus Christ; and it would appear that, in consequence of disputes arising among them concerning him, great numbers were buried alive, and otherwise put to death by the rest, on which the settlements on the Molochna were broken up in 1841, and great part of the people transferred to the provinces beyond the Caucasus.

DUCK. See **ANAS**. The broader bill, laminated and not toothed, distinguishes the Linnaean genus *anas* from *mergus* (including smews, mergansers, and the goosander). In recent ornithological systems, however, it is divided into numerous genera, but three chief groups are usually recognized, corresponding to swans, geese, and ducks of popular nomenclature. See **GOOSE** and **SWAN**. The group to which the name D. is sometimes extended, both by scientific writers and in popular language, is characterized by greater breadth of bill than either the swans or geese. Their food is chiefly animal, whilst that of both swans and geese is in great part vegetable. Their legs are shorter and placed further backward than those of geese, so that they move with greater difficulty and with a more waddling gait on land, and their necks are shorter than those of geese, and much shorter than those of swans, although in this character there is a considerable difference between different species. There is a very marked difference in plumage between the males and females, which is not the case in any corresponding degree in swans and geese. They exhibit also a peculiar anatomical character in a large dilation of their trachea (windpipe) on each side at its bifurcation. This great group of ducks is subdivided into two sections; one section characterized by a webbed or broadly margined hind-toe, the other by a hind-toe destitute of membrane. These characters are connected with important differences in other respects, and particularly in habits; the ducks of the first section being chiefly oceanic, living more exclusively on animal food, and diving readily and frequently in pursuit of it; whilst those of the second section are more generally inhabitants of lakes and other inland waters, showing a preference for shallow waters. Those of the first section also have the feet placed further backward than those of the second; those of the second have generally longer wings than those of the first, and a longer neck by which they are adapted for seeking their food by dabbling in muddy shallows, they less frequently dive, and when alarmed, generally seek safety by taking wing. Many of both sections are migratory, and spend the summer in arctic and sub-arctic regions. Not a few of them are common to the northern parts of both the eastern and western continents. Their plumage is remarkably thick, soft, and compact. The tongue, which, unlike that of most birds, is large and fleshy, assists in the selection of food. To the first or oceanic section of ducks belong scoters, garrots, eiders, pochards, scaups, harelds, etc.; to the second section belong sheldrakes, shovellers, musk ducks, summer D., pintails, gadwalls, teals, widgeons, bluewings, etc. Most of these varieties will be described under their respective names.

The **COMMON DUCK**, or **DOMESTIC DUCK** (*anas boschas*), known also in its wild state as the **WILD DUCK** or **MALLARD**, belongs to a genus, or sub-genus, of the second section, characterized by a flattish broad bill, longer than the head, not contracted, nor much dilated, towards the tip, and not much elevated at the base, destitute of tubercle at the base, the denticulations of the upper mandible (ends of the laminae) scarcely projecting beyond the margin, and a short and rather pointed tail of 16 feathers. Even as thus characterized, it includes teals (q.v.), which are by some ornithologists constituted into a separate genus. The male (drake) of the common D. has the four middle tail-feathers recurved. The deep emerald green of the head and upper part of the neck, the white collar which separates the green from the dark chestnut of the lower part of the neck, and the deep blue iridescent *speculum* of the wing—formed by the outer portion of the outer web of the secondaries—are also marked characteristics of this beautiful bird; the plumage of which exhibits greater brightness of colors—during the breeding season at least—in the wild than in the domestic variety. At the close of the breeding season, the male of the wild-duck assumes for a time a plumage more sober, and resembling that of the female; but before winter, the splendid plumage proper to his sex is again acquired. The mallard or wild-duck is a widely-distributed bird, being found in the northern parts of Europe, Asia, and America, and extending southward as far as Florida—where it is abundant—and the West Indies, although in the old world it is not known as belonging to regions of similar climate. It was formerly much more abundant than it now is in Britain, the drainage of marshes having apparently tended more than any other cause to the diminution of its numbers. Multitudes of mallards, however, still visit the fen counties of England in winter; and great numbers are taken in decoys, along with other *anatide*, and sent to the London market. See **WILDFOWL**. Many wild-ducks, however, still breed in Britain, sometimes near the lakes or rivers which they frequent, sometimes in more elevated moorish districts, from which the parents often take opportunity of bringing their very young brood to the lower waters, by swimming down the streams on some occasion of their being swollen by rain, and it is interesting to see the little creatures hurried on, without injury, by the current, and passing along narrow rapids and over waterfalls of considerable height, much as pieces of cork might do, and with as little apparent injury. The nest is composed of grass, intermixed and lined with down, and the eggs are usually 9 to 12 in number.

This species, in a wild state, always pairs, but in domestication it becomes polygamous, and the care of the young is left entirely to the female. It has been long common in the poultry-yard, being valued for its eggs and its flesh; and there are breeds, as the Aylesbury D., etc., remarkable for their great size and delicacy of flesh. In situations where they have ready access to a lake, pond, or stream, ducks are easily managed, and very useful poultry. In other circumstances, they cannot be kept with advantage.

The species most nearly allied to the common D. is said to be the **JAVANESE DUCK**

(*A. Javanensis*). The **BLACK DUCK** or **DUSKY DUCK** (*A. obscura*) of North America is also very nearly allied to it, and is generally distributed from Labrador to Texas. The summer D. or wood D. of North America, and the Mandarin D. or Chinese D., belong to a nearly allied genus or sub-genus (*dendronessa*), with shorter bill and pendent occipital crest. See **SUMMER DUCK**. The **TREE DUCK**, or **WHISTLING DUCK**, of the warmer parts of America, also belongs to a distinct but nearly allied genus or sub-genus (*dendrocygna*). See illus., **FOWL, ETC.**, vol. VI.

DUCK-BILL, *Ornithorhynchus*, or *Platypus*, a genus of *mammalia*, of the order *monotremata* (q.v.). Only one species is fully ascertained, *O. paradoxus* or *P. anatinus*. It inhabits the rivers of Australia, Papua, and Tasmania. In the Australian colonies it is generally called **WATER MOLE**. The first descriptions of this singular quadruped were received with incredulity, and even when a stuffed specimen was brought to England, it was suspected to have been ingeniously fabricated. The whole length, including bill and tail, is usually from 20 to 23 inches. The body is rather long and compressed, thickly covered with very glossy hair, among the roots of which there is a layer of soft short waterproof felt or wadding. The head is small and round, with small bright eyes, and no external ears, although the internal ears are perfectly developed, and the hearing acute; and instead of the muzzle, mouth, and teeth of an ordinary quadruped, the creature is furnished with a bill like that of a duck, but broader in proportion, near the extremity of the upper mandible of which the orifices of the nostrils are placed. The bill is covered with a leathery membrane. There are no true teeth, but the bill has small transverse laminae, like the bill of a duck; and at its base, on each side of each jaw, are two horny protuberances without roots or bulbs. The tongue is beset with villosities, does not extend to the extremity of the bill, and bears at its base what has been described as another tongue of a thicker form, and with two little fleshy points in front. The legs are short; the fore-feet have each five toes, with strong burrowing claws, and a connecting membrane for swimming, which extends even beyond the claws, but is capable of being folded back, so as not to impede their use in burrowing. The hind-feet are smaller than the fore-feet; they have each five toes armed with claws, and webbed, but the web does not extend beyond the base of the claws. The hind-feet of the male are armed with sharp spurs, like those of a cock, which are merely rudimentary in the female. These spurs were at one time erroneously supposed to be venomous. The tail is strong, broad, and flattened, about half as long as the body, covered with longer and coarser hairs, and nearly naked on its under surface. The duck-bill, besides the characteristics of the *monotremata*, exhibits other anatomical peculiarities which resemble those of birds, and some—principally osteological—which even resemble those of saurian reptiles. It lives chiefly in the water, and seeks its food by means of its bill in the mud, like ducks. Its food consists chiefly of aquatic insects, mollusks, etc.; but it is said also to feed on small fish, and even on vegetable food; and in confinement, it can be fed on worms, mince-meat, or egg, and bread and milk. It makes serpentine burrows of great length—20 or even 50 ft.—in river-banks, entering near the water's edge, and enlarged at the termination into a receptacle or nest, which is furnished with dry weeds for the accommodation both of parents and young. The young are produced in a very imperfect state: the duck-bill is indeed strictly ovoviviparous; the fetus receives no nutriment from the parent before birth, except what it derives from the ovum, which, however, is hatched within the body of the parent; but the young are suckled, and the mouth is adapted to this by the comparative shortness of the bill and greater length of tongue at this period of life. The duck-bill is lively and active, and so readily alarmed by the appearance of danger as not to be easily shot, diving before aim can be taken. It is usually to be seen with only its head above the surface of the water. It prefers the twilight to the glare of day. Its voice resembles the growl of a small puppy. It carefully dresses and pecks its fur. When asleep, it rolls itself up into a ball. See illus., **MARSUPIALIA**, vol. IX.

DUCK CREEK, a water-course of central Australia, is the largest of the channels which drain into the Darling (q.v.).

DUCKING-STOOL, an apparatus at one time in use in Britain for the punishment of scolding wives. The ducking-stool grew out of the cucking-stool, which was not, as many have supposed, a mere difference of name for the same thing. The cucking-stool of itself did not admit of the ducking of its occupants. It was a simple chair in which the offender was placed, usually before her or his (for the cucking-stool was not so specially for women as the ducking-stool) own door, to be pelted and insulted by the mob. In conjunction with another instrument of degradation, however—the tumbrel—the cucking-stool was occasionally used for ducking; but the ducking-stool *par excellence* was specially made for purposes of immersion. There were various examples of the ducking-stool. Sometimes it “consisted of a rough strong chair attached to one end of a beam, which worked on a pivot on a post bedded into the ground at the edge of the dam,” or the river, as the case might be. “The woman was placed in the chair with her arms drawn backwards; a bar was placed across her back and in front of her elbows;” another bar held her upright, and there were cords to tie her securely in. The executors of the punishment then took hold of a chain at the opposite end, and gave her a ducking on the “see-saw” principle. A ducking-stool was in use for actual duck-

ing at Leominster as recently as 1809. The beam to which the chair was attached was 23½ ft. in length, the ducking being administered in the manner previously described.

DUCKWEED, *Lemna*, a genus of plants, referred by many botanists to the natural order *araceæ*, but regarded by others as the type of a small natural order, *lemnaceæ*, which consists chiefly of floating plants, mere flat green fronds, with roots hanging loosely in the water, and unisexual flowers—destitute of calyx and corolla—bursting through a membranous spathe in their margin.

DUCLERC, CHARLES THÉODORE EUGÈNE, French statesman, was born at Bagnères-de-Bigorre, in 1812. From 1836 to 1846 he was engaged in journalism, and wrote a series of remarkable articles on political economy and finance. The events of 1848 brought him into political life, and he served as minister of finance and in other offices. During 1871–75, he served in the National Assembly, and in 1875 was elected a senator for life. He succeeded de Freycinet as minister in 1882; the attitude of his ministry on the Egyptian question was that of passive protest, and it soon fell. He d. in 1888.

DUCLOS, CHARLES PINEAU, 1704–72; a native of Brittany; writer of romance and history. Among his works were *Acajou and Zirphile*; *The Baroness de Luz*; and *Confessions of the Count de XXX*, all romances; *History of Louis XI.*; *Secret Memoirs of the Reigns of Louis XIV. and XV.*; *Considerations on Italy*, etc. Though living in Paris he was elected mayor of Dinant, and was chosen deputy to the assembly of the states of Brittany. At the request of that body he was granted a patent of nobility.

DUCORNET, LOUIS CÉSAR JOSEPH, 1806–56; a French artist. He was born without arms, and learned to use his feet for hands. Having a talent for painting, he made such excellent drawings with his toes that at the age of 13 he was taken into the academy as a pupil. When but 16 he took the first prize for drawings of the human form, and both the national government and his native city settled pensions upon him. Not only was he without arms, but he had only four toes on each foot, and his lower limbs were far from perfect. In conversation, he gesticulated with his legs. He was expert in painting, and among his best efforts were “Parting of Hector and Andromache,” and “Edith Finding the Body of Harold.”

DUCROT, AUGUSTE ALEXANDRE, b. 1817; a French general, educated at St. Cyr; served in Algeria and Africa, and in 1869 in command of the 6th division quartered at Strasburg. He fought at Sedan, and when MacMahon was wounded, took the chief command. After surrender he refused to accept conditions, escaping to Paris, and took command of the 13th and 14th army corps. He participated in the last disastrous sortie, Jan. 19, 1871. After the fall of Paris he was elected to the national assembly. He published *The Truth about Algeria*; *The Day of Sedan*; and some other works. He d. 1882.

DUCTILITY is that property of bodies by which they are capable of being drawn out in length, while diminishing in breadth, without fracture or separation of their parts. Ductility is peculiarly noticeable in the case of metals. It is possessed also by gums, glues, resins, and some other bodies, which, when softened by water or heat, may be drawn into threads. Clays, when moistened, become ductile. Metals are ductile, generally speaking, at any temperature, but their D. is much influenced by temperature; some—brass, for example—are more ductile at ordinary temperatures than when hot. Metals are ductile nearly in the order of their malleability (q.v.), the order of their D. being as follows, beginning with the highest: gold, silver, platinum, iron, copper, zinc, tin, lead, nickel, palladium, cadmium. Some, however, as iron, are more ductile than malleable. The D. of gold and glass is surprising; see article **DISTENSIBILITY** for an account of the fineness to which gold-gilt, silver wire, and glass tubes have been drawn. The D. of glass at red heat seems to have no limit; at high temperatures, this brittle substance may be drawn into threads finer than any hair, and of the highest flexibility. Its flexibility, indeed, according to some, increases in proportion to the fineness to which its threads are drawn, and it is conceived to be possible that we may yet convert glass into cloths for wearing apparel.

DUDE, a derisive term applied to a foppish man, and first used in the U. S. about 1880. Some would derive the nickname from *duds*, used in the sense of clothes in general. It may, however, have come from the German, inasmuch as Grimm (*Wörterbuch*, 1860) gives the following definition: *Dude*, *ein alberner mensch*; *stupidus*; a stupid man; a blockhead. See **CHIC**; **INCROYABLES**.

DU DEFFAND, MARIE DE VICHY CHAMROND, Marquise, a celebrated Frenchwoman, was b. of a noble family of Burgundy in 1697, and educated at the convent of La Madeleine de Trenelle, in Paris. Here she manifested that boldness of opinion and vivacity of intellect which obtained for her so many distinguished admirers in after-years. Her parents, alarmed at her skepticism, sent the eloquent Massillon to converse with her, who was, however, more struck with the wit and beauty of the young lady, than she was with the force of his arguments. In 1718, she married the marquis Du Deffand. The union was unhappy, and a separation took place, whereupon the marquise threw herself into all the excesses of gallantry which characterized French society in the 18th c., and had the name of being, for a time, the mistress of the regent. Subsequently a reconciliation took place between her and her husband, but it lasted only a short period. She then set up an establishment of her own, and gathered round her all the wits, philosophers, and men of fashion in her day. Among her friends and correspondents may be mentioned D'Alembert, Voltaire, President Hénault, Montesquieu, Marmontel, and

Walpole. Her evening-parties at her residence in the rue St. Dominique were famous. They formed a rendezvous for all the notabilities of Paris, and were much relished by distinguished foreigners visiting the city. In 1753, she became blind, and in the following year chose as companion and reader a young lady, Mlle. de l'Espinasse, of whom, however, she became very jealous, on account of the attentions paid to her by the friends of the marquise. In 1764, the two ladies separated, Mlle. de l'Espinasse carrying with her a large number of enthusiastic partisans, who deserted the saloon in the rue St. Dominique, at the head of whom was D'Alembert. The marquise Du D. died 24 Sept., 1780. Her correspondence with D'Alembert, president Hénault, Montesquieu, and the duchesse du Maine was published in 1809; and in the following year appeared at London her correspondence with Horace Walpole (written between 1766 and 1780), to which were added her letters to Voltaire.

DUDEVANT, AMANTINE LUCILE AURORE, MADAME, a French authoress, who has attained an extraordinary celebrity under the name of **GEORGE SAND**. She was b. at Paris in 1804, and descended by the father's side from the famous marshal de Saxe. Her maiden name was Dupin. After having received a strict conventual education (1817-20), she married M. Dudevant in 1822; but in the course of a few years, finding the lack of congeniality of sentiment intolerable, she arranged a separation with her husband in 1831, and repaired to Paris, where at first she was hard pushed to secure a livelihood. Her first literary efforts made their appearance in the *Figaro*. In conjunction with her friend and companion for the time, Jules Sandeau, from whose name she formed her *nom de plume*, she wrote a romance, entitled *Rose et Blanche* (1832), which only occasionally rises above mediocrity, and gave no hint of the splendid ability first fully developed in *Indiana*, published in the same year. This romance, in which a glowing heart, deeply wounded by the pressure of social relations, gives vent to its feelings, excited considerable interest. This was increased to the utmost by the succeeding romances—*Valentine* (1832); *Lélia* (1833); *Jacques* (1834); *André* (1835); *Leone Leonè* (1835); and *Simon* (1836). During the next two years, she published a great variety of works, in which she showed herself to be deeply influenced by the age in which she was living. In addition to her purely imaginative productions, Madame D. found time to contribute miscellaneous essays and political articles to the journal entitled *Le Monde*, so long as it was edited by Lamennais. She was much occupied at this time with philosophical and theological speculations, and their influence may be traced in the *Spiridion* (1839), and the extraordinary piece of prose poetry, entitled *Les Sept Cordes de la Lyre* (1840). She cherished, moreover, republican ideas of the wildest nature, which appeared conspicuously in the *Compagnon du Tour de France* (1840), and in *Pauline*. Her brilliant literary success having now placed her in comfortable circumstances, she obtained a legal divorce from her husband, and thus secured possession of a portion of the property which she had brought to him as her dowry. She now occupied herself with the education of her two children, and spent her time, sometimes in Paris, sometimes at her estate in Berri, where she had passed her childhood, or in journeys into Switzerland and Italy. A dispute with the editors of the *Revue des Deux Mondes*, which, from 1833 to 1841, had regularly published her works in chapters before they appeared in a separate form, induced her to start the *Revue Indépendante*, in conjunction with P. Leroux and Viardot. For this new review, she wrote *Horace*, *Consuelo*, and *La Comtesse de Rudolstadt* (1842-43), three romances deeply imbued with democratic feelings and sentiments, which are apparent likewise in *Jeanne* (1844), and which in the *Mémoires d'Angibault* (1845), becomes altogether socialistic. It would be impossible to enumerate the works which flowed from her rapid pen between this period and the revolution of 1848. It is sufficient to say, that her socialistic sympathies predominate in all of them; but if the logic is not convincing, the vigor and purity of her imagination are undeniable. This is always the case with Madame Dudevant. Even those who disapprove of her exaggerated and one-sided ideas, and views of life, must admire the perfect form, the captivating style, the plastic finish, and the great affluence of thought and sentiment displayed in all her productions. Her finest romances are *Valentine*, *André*, and, in particular parts, *Consuelo*, which is her best known work. Of her smaller pieces, *La Mare au Diable*, is a masterpiece of its kind, and indeed, considered from an æsthetic point of view, is the most complete production of her pen. After the revolution of Feb., Madame D. for a short time wasted her talents on the barren politics of the day. She subsequently devoted herself to writing plays, which were received less favorably than her novels, though the *Marquis de Villemer*, and one or two more, were very successful. In 1854, she published *Histoire de Ma Vie*; in 1871, *Journal d'un Voyageur pendant la Guerre*; and in 1873, *Impressions et Souvenirs*. Madame D. died on June 8, 1876.

DUDLEY, a parliamentary borough in a detached part of Worcestershire, in the s. of Staffordshire, 26 m. n.e. of Worcester, and 8½ m. w.n.w. of Birmingham. It is a well-built town, and a chief seat of the iron trade. On the n.e. of the town are the beautiful ruins of an old castle, founded in 760 by Dodo, a Saxon prince. It was demolished in the time of the civil wars of Charles I., was rebuilt, but was afterwards burned down in 1750. In the vicinity are iron and coal mines, and limestone quarries. The limestone is Silurian, and full of organic remains; it is wrought out of caverns, and brought

to the kilns through a tunnel one mile and three-quarters long, which is carried through the basalt of the castle hill. Saline springs occur near. The chief manufactures are fire-irons. Pop. par. b., '91, 90,223.

DUDLEY, BENJAMIN WINSLOW, LL.D., 1785-1870; b. Va.: a surgeon, educated in Transylvania and Pennsylvania universities; studied in Europe, and settled in Lexington, Ky. His specialty was lithotomy, or removing stone from the bladder, of which his recorded operations numbered 225, with 6 deaths. He also successfully used ligatures on the carotid artery for aneurism in the skull. He was professor of surgery in the medical school of Transylvania university, which he organized, and which was long the leading medical school in the west; and author of a number of valuable papers.

DUDLEY, CHARLES EDWARD, 1780-1841; a native of England; came to America in 1794; in 1809, married into the Bleecker family of New York, and settled in 1811 at Albany. He was successively state senator, mayor of the city, and U. S. senator to fill the unexpired term of Martin Van Buren, whom Jackson had sent as minister to England. He was greatly interested in astronomical science, and after his death his widow gave \$70,000 for the erection of the observatory at Albany, which bears his name.

DUDLEY, JOSEPH, 1647-1720; b. Mass.; son of Thomas, and also governor of the colony. He studied theology, but went into political life, and from 1677 to 1681, was one of the commissioners of the united colonies. He was at the battle with the Narragansetts in 1675, and one of the commissioners to make peace with that tribe. James II. made him president of New England in 1685; two years later, he was appointed chief-justice, and was arrested as one of the friends of Andros, with whom he was sent to England. In 1690, he was made chief-justice of New York. In 1693, he went to England, and in 1701 was elected to parliament. From 1702 to 1715 he was governor of Massachusetts colony. He was a philosopher, a scholar, a divine, and a lawyer.

DUDLEY, PAUL, 1675-1751; son of Joseph; graduate of Harvard; studied law in London; was commissioned attorney-general of Massachusetts in 1702, promoted to the bench in 1718, and made chief-justice in 1745. He was a member of the legislature, a learned naturalist, and a member of the royal society. He left a legacy to Harvard to establish a yearly lecture in defense of Christianity; and published a number of works, among them one against the church of Rome.

DUDLEY, THOMAS, 1576-1652; a native of England, who came to Massachusetts in 1630 as deputy-governor, and was governor from 1634 to 1640, and again from 1645 to 1650. He had been an officer of the British force in Holland, and retrieved the fortunes of the earl of Lincoln by judicious management of his estates. He was a bold and somewhat intolerant man, but an efficient officer. He died at Roxbury, leaving a large estate. Simon Bradstreet was his son-in-law.

DUDLEY, THOMAS UNDERWOOD, D.D., b. Richmond, Va., 1837; graduated from the univ. of Virginia, 1858; prof. of Latin and Greek in the univ. He was ordained priest in the Prot. Epis. church, 1868; was rector of Christ church, Baltimore, until his elevation to the episcopacy, 1875, when he was appointed assistant bp. of Ky. He became bishop in 1884.

DUDLEY LOCUST, the popular name for a trilobite (*calymena Blumenbachii*, q.v.) which is very abundant in the Dudley limestone.

DUEL (Fr. *duel*, Lat. *duellum* or *dvellum*, which, as Cicero remarks [*Orat.* 45], was the old form of *bellum*, war), a combat between two persons, at a time and place indicated in the challenge, cartel, or defiance borne by one party to the other. A D. generally takes place in the presence of witnesses, called seconds, who regulate the mode of fighting, place the weapons in the hands of the combatants, and enforce compliance with the rules which they have laid down.

No trace of the D., as an institution, is to be found in the history of the classical nations of antiquity, the Latin word from which ours is derived having been used to signify a war between two nations. So long as men continued to be barbarians, their personal quarrels were no doubt decided in the ancient, as national quarrels still are in the modern world, by an appeal to physical force. But though war has been in all times the practical solution of strife, it was not till the middle ages that it came to be regarded as a means, in any sense judicial, of settling disputes. Hitherto, it had determined who was able to prevail, justice being set aside, but it was a new view that it would determine who ought to prevail on the principles of justice. The rationale of the *judicial combat* or *wager of battle* was probably two-fold. On the one hand, and generally amongst the people, it depended on a belief that God would interfere directly and miraculously in the conflict to protect the innocent, and to punish the guilty, and that thus the weakest combatant who had God on his side would prove more than a match for the strongest, when destitute of His aid. But there was a view of the matter which was not so directly superstitious, and which rested rather on a confusion between the principle of the original constitution and the principle of the transmission of rights. All human rights originate in the powers and faculties which God has given to man, and it was supposed that as the right originated in power, its continued existence in

the individual could be ascertained by ascertaining whether the power still existed in him. The error consisted, as we have said, in confounding the principle of the constitution with the principle of the transmission of rights. If a field which was claimed by two competitors had as yet been appropriated to nobody, or had been abandoned, and was, as lawyers say, *res nullius*, the fact of which of the two claimants ought to become the possessor, might be ascertained by judicial combat. But if it was already the property of one of them on a title which was to be held sacred, and the question was which of the two had this sacred title, that fact could never be determined by ascertaining which would have been in a condition to constitute it for the first time, had it been non-existent. The principle of the private D., in so far as it had any principle at all, and was not merely a piece of barbarous and irrational foppery, was precisely the same as that of the judicial combat. But the latter had been applied to a class of cases which admitted of legal investigation and decision, and it was consequently abandoned in the days of Queen Elizabeth; whereas the former was supposed to be a means of redressing wrongs which hardly can come within the cognizance of a human tribunal, and the consequence was that it continued in green observance in this country until recently, and is still in vigor in many continental countries.

Like the other peculiarities of mediæval life, the D. probably originated with the Germanic nations. It is said to have been introduced into legal proceedings in lieu of an oath by Gundebald, king of the Burgundians, in 501. Louis le Débonnaire was the first of the French kings who permitted litigants to appeal to arms. The practice was prohibited by Henry II., in consequence of a noted D. which took place in his presence between his friend, Francis de la Chastaignerie, and Guy Chabot de Jarnac, in which the latter was slain. The royal edict, however, was totally ineffectual, and the practice of private dueling has generally prevailed more extensively in France than in any other country. Francis I. patronized it by declaring that a lie could be borne without satisfaction only by a base-born churl, and still more by the example which he set in challenging his own great rival Charles V. In 1589, the parliament of Paris declared all persons who were either principals or seconds in D. to be rebels to the king. But its efforts were unavailing; and it is said that during the first 18 years of Henry IV., no fewer than 4,000 gentlemen perished in this foolish manner. In 1609, Henry added to the existing penalties, introducing even punishment by death in extreme cases. But these regulations were forced upon him by popular feeling; he had himself no aversion to the practice, and when he gave permission to Crequi to fight Don Philip of Savoy, he added: "If I were not the king, I would be your second." The consequence of this feeling was, that he readily granted pardons to those who had violated the laws which he had been forced to enact, and these laws not unnaturally produced an effect the very reverse of their ostensible object. Dueling acquired the charm of what the French call "forbidden fruit," and thus became a fashionable and favorite vice. In the reign of Louis XIII., the custom was so prevalent, that lord Herbert, the English ambassador, wrote home to his court that there was scarcely a Frenchman worth looking on who had not killed his man. It would not seem, however, that it was from negligence in enforcing the royal edicts that dueling then reached to so alarming a height; for it was during this reign that two noblemen, the greatest duellists of the day, the count de Boutteville and the marquis de Beuron, were tried and beheaded for persisting to fight. In the commencement of the reign of Louis XIV., D. with four or five a side began to be fought; and two very sanguinary affairs of this description having taken place, in which several persons of the highest rank were slain, the king determined to put an end to the practice. He published an edict in 1679, forbidding it under the highest penalties, which, unlike most of his predecessors, he had the firmness to inflict; and this measure, together with a solemn agreement which was entered into amongst the nobility themselves, led at that time to its almost total abolition.

The D. does not seem to have existed in England in Anglo-Saxon times, and was probably introduced at the conquest. In its judicial form, it was not entirely obsolete in the reign of queen Elizabeth; and sir Henry Spelman gives an account of a trial by battle, which terminated, however, without actual combat, in the year 1571. See BATTEL, TRIAL BY. Private dueling was common, however, both in Elizabeth's reign and in that of her successor, by whom a severe statute against it was enacted in Scotland (1600, c. 12). During the civil wars, men's minds were too much occupied with questions of grave importance to leave time for questions of etiquette, and the D. consequently declined; but it became exceedingly prevalent during the dissolute reign of Charles II. Some attempts were made to suppress it in the reign of William III., both in England and Scotland, and, in 1712, the subject was recommended to the attention of parliament in the queen's speech. But the bill which was brought in by the government was thrown out, and the practice continued to prevail. When the custom of wearing the sword was abandoned, the number of duels diminished, though it was then that their irrational character may be said to have attained its maximum. The pistol was substituted for the sword, and the doctrine of chance—which was reduced to an absurdity by the medical D. of a couple of pills, one composed of bread and the other of poison—was inaugurated. Since this period, the practice has fallen into disrepute, by the gradual operation of public opinion, and in this country it may probably be now regarded as finally abolished. By the law of Gr. Britain, the act of killing in a D. has always been

regarded as murder, however fair the D. may have been; but whilst the practice was countenanced by public opinion, it was generally found impossible to induce a jury to convict. That a verdict of acquittal could not be looked for with the same security in the present day, is probably a pretty good guarantee for the practice not again making its appearance even in exceptional instances. In France it still prevails to a certain extent.

The duels of the students at the German universities, of which so much has been said and written in this country, are nothing more than fencing-matches with sharp weapons. They are foolish, but not deadly affairs, as the seconds, who are also armed, always interfere to prevent serious bloodshed.

In 1844, several new articles of war were issued by the commander of the forces, with a view to the abatement of dueling in the English army.

1. Every officer who shall send a challenge, or who shall accept a challenge to fight a D. with another officer, or who, being privy to an intention to fight a D., shall not take active measures to prevent such D., or who shall upbraid another for refusing or not giving a challenge, or who shall reject or advise the rejection of a reasonable proposition made for the honorable adjustment of a difference, shall be liable, if convicted before a general court-martial, to be cashiered, or suffer such other punishment as the court may award.

2. In the event of an officer being brought to a court-martial for having acted as a second in a D., if it appear that such officer exerted himself strenuously to bring about an honorable adjustment of the difference, but failed through the unwillingness of the adverse parties, then such officer is to suffer such punishment as the court shall award.

3. Approbation is expressed of the conduct of those who, having had the misfortune to give offense to, or injure or insult others, shall frankly explain, apologize, or offer redress for the same, or who, having received offense, shall cordially accept frank explanations or apologies for the same; or, if such apologies are refused to be made or accepted, shall submit the matter to the commanding officer; and, lastly, all officers and soldiers are acquitted of disgrace or disadvantage, who, being willing to make or accept such redress, refuse to accept challenges, as they will only have acted as is suitable to the character of honorable men, and have done their duty as good soldiers who subject themselves to discipline.

Partly in consequence of these regulations, but still more as a result of the increasing reason and humanity of English society, the practice of dueling has become almost as entirely obsolete in the British army as it has in the country generally. See ORDEAL.

In the southern portion of the United States the custom of dueling, though of late years falling into disuse, is, to some extent, a recognized institution of society. Half a century ago the pistol and the bowie-knife were as much a part of a man's equipage as his hat or his boots. A gentleman of good social position who had not fought at least one duel was often looked upon as deficient in the qualities proper to his station. Sudden affrays in the streets, stealthy assassinations, and bitter family feuds, were the consequences. These feuds rived in duration and ferocity the Venetian vendetta. The land was full of swaggering bullies who had, metaphorically, in one hand a pack of cards and in the other a pistol. Modern civilization, and more especially the war of the secession, in which the southern states suffered so terribly, have greatly modified this fire-eating spirit. Other influences have assisted. Not only is the general voice against the practice, but in a large number of the states laws have been enacted which pronounce the killing of a fellow-being in a duel to be murder, and in still more states the mere sending of a challenge is a felony. The first duel on record in America was fought June 18, 1621, in New England, between two servants who fought with sword and dagger, and both were wounded. They were sentenced to have their heads and feet tied together, and lie 24 hours without meat or drink. In 1728, one young man killed another on Boston common in a night duel with swords. The survivor escaped from the country, and a severe law against dueling was enacted. During the revolution there were a number of duels. Charles Lee and John Laurens fought, and the former was wounded; Gwynnett, a signer of the declaration of independence was killed by Gen. McIntosh. Gen. Greene was twice challenged, but refused to fight, and Washington approved his refusal. The most notable duel in the country's history was when Alexander Hamilton was slain by Aaron Burr. On that occasion a great man was lost to the nation, and a dangerous demagogue was socially and politically ruined. In the navy the duel in which Decatur was killed and Barron wounded holds the first place. Andrew Jackson killed a man named Dickinson, and was engaged in several other conflicts. Col. Benton killed Lucas, and also had other duels. Henry Clay and John Randolph, the two most brilliant men at that period in congress, fought in 1826. Jonathan Cilley, a member of congress from Maine, was killed by William J. Graves, a member from Kentucky, in 1838. Although himself a duelist, Jackson, while president, expelled officers from the navy for dueling. At the present time a person in the military or naval service implicated in a duel, either as principal or second, may be summarily cashiered. In the northern states the appeal to arms is seldom heard of, though by no means uncommon at the beginning of the century. De Witt Clinton fought with and wounded John Swartwout in 1802, and the next year challenged Gen. Dayton of New

Jersey. One might suppose that journalism was a calling of any other than a warlike nature, but there have been several notable duels between editors. In 1804, James Cheetham, editor of the *American Citizen*, challenged William Coleman, editor of the *New York Evening Post*. The two did not fight, but there was a duel growing out of the challenge between Coleman and a harbor-master named Thompson, and the latter was supposed to have been killed. John D'Oley Burke, an Irishman, author of a drama called *Bunker Hill, or the Death of Warren*, and editor of a paper in New York, was killed in a duel in 1808. In 1846, Thomas Ritchie, jr., and John H. Pleasants, editors of the *Enquirer* and the *Whig* of Richmond, Va., met in a field, armed with swords and pistols, and had a desperate fight, in which Pleasants was killed, Ritchie being only slightly wounded. In 1842, James Watson Webb, editor of the *New York Courier and Enquirer*, fought with Thomas F. Marshall, a member of congress from Kentucky, and Webb was slightly wounded. The number of duels among editors in the southern states is very great. In some of the states the killing of a man in a duel is punishable with death; in others by imprisonment and forfeiture of political rights. In some states certain officers are required to swear that they have not been, within a certain period, and will not be, engaged in a duel.

DUENNA (feminine of "Dueño"), a woman in Spain, something more than a governess, and something less than an equal of the family, having charge of a gentleman's daughters, or being companion to the lady of the house.

DUER, JOHN, LL.D., 1782-1858; b. N. Y.; a distinguished jurist; son of William Duer, a revolutionary patriot whose wife was a daughter of William Alexander, claimant of the earldom of Stirling. Duer studied law, and from 1820 until his death was in practice in New York. In 1825, he was one of the commissioners to revise the laws of the state; in 1849, he was elected justice of the superior court, and in 1857, became chief justice. He published *Duer's Reports*, works on marine insurance, and addresses before the New York historical society.

DUER, WILLIAM ALEXANDER, 1780-1858; b. New York; brother of John. Through his mother he was grandson of lord Stirling. He studied law, and about 1802 became a partner of Edward Livingston, in New Orleans. About 1812, he returned to New York, where from 1822 to 1829, he was a judge of the supreme court. In 1829, he was elected president of Columbia college. He published a *Treatise on the Constitutional Jurisprudence of the United States*.

DUET, in music, a composition for two voices or instruments.

DUFAURE, JULES ARMAND STANISLAS, b. Saujon, France, 1798; studied law in Paris, and in 1834 was chosen deputy from Saintes, and regularly re-elected until 1848. He was councilor of state in 1836, and minister of public affairs in 1839. In 1844, he was chosen vice-president of the chamber, and after the revolution of 1848, was minister of the interior. Louis Napoleon gave him the same office, but after the *coup d'état* he returned to private life. In 1871, he was made minister of justice and vice-president of the council of ministers, but these offices were taken away in 1873. He d. 1881.

DU FAY, CHARLES FRANÇOIS DE CISTERNAY, 1698-1739; b. Paris. He made important researches concerning the barometer, the nature of phosphorus, the refracting power of crystals, electricity, and the magnet. He spent many years in rearranging and improving the garden of plants in Paris.

DUFF, ALEXANDER, D.D., LL.D., who so thoroughly identified himself with the cause of Indian missions, was b. 25th April, 1806, at a farm near Pitlochry, in Perthshire. He studied at the university of St. Andrews with great success. In 1829, he resolved to go out to India as a missionary from the church of Scotland; and in Oct. of that year, having been previously ordained, he set sail from Portsmouth for India. On the passage out, he was wrecked on a barren island to the n. of the cape of Good Hope, and at length reached his destination after a disastrous voyage of eight months. At the disruption in 1843, the missionaries in India being obliged to declare with which party they would connect themselves, D. resolved to cast in his lot with the free church, and for 20 years carried on with great energy the missionary work at Calcutta under the auspices of that body. In the year 1837, he received the degree of D.D., in acknowledgment of his distinguished services. D. visited his native land twice after 1829, before returning altogether in 1863. He was moderator of the general assembly of the free church in 1851 and 1873, and was professor of evangelistic theology in the free church colleges. He took an important part in various philanthropic societies and schemes. Dr. D. was gifted with great fervor and extraordinary fluency as a speaker, and he wrote voluminously. Amongst his writings are, *New Era of the English Language and Literature* (1837); *Missions the Chief End of the Christian Church* (1839); *India and Indian Missions* (1839); *The Indian Rebellion, its Causes and Results* (1858). *The Calcutta Review* was mainly established by Dr. Duff. He died 12th Feb., 1878.

DUFFERIN AND AVA, FREDERICK TEMPLE HAMILTON BLACKWOOD, Marquis of, b. England, 1826; educated at Eton; succeeded his father in 1841 as fifth baron Dufferin and Clandeboyne. He was for some years lord-in-waiting on the queen. During the Irish famine of 1846-47, he traveled in that country, and wrote an account of the wretchedness. In 1855, he was attached to the Austrian mission. In 1859, he made a yacht voyage to

Iceland, an account of which he published in *Letters from High Latitudes*. In 1860, he was sent as British commissioner to Syria to inquire into the massacre of Christians. In 1864, he was under-secretary of state for India, and in 1866, under secretary of war. Gladstone, in 1868, made him chancellor of the duchy of Lancaster; and in 1872, he was appointed gov. gen. of the dominion of Canada, where he had great popularity. In 1876, he made a tour through British Columbia. In 1878, he was superseded by the marquis of Lorne, and was immediately elected president of the royal geographical society. He was made an earl in 1871. He was ambassador to Russia in 1879-81, and to Turkey in 1881-84; viceroy of India, 1884-88; ambassador to Italy in 1888-91; and became ambassador to France in 1891. In 1890 he published his collected speeches. His wife, Harriet Hamilton, is well known for her philanthropic work among the native women of India and for the interesting books, *The Record of Three Years' Work* (1889), and *Our Vice-Regal Life in India* (1890). In 1891 he became lord rector of Glasgow University, and in 1891-5 was lord warden of the Cinque Ports.

DUFFY, Sir CHARLES GAVAN, b. Monaghan, Ire., 1816; in his 20th year became editor of the *Belfast Vindicator*, a prominent Rom. Cath. paper; in 1842, with Thomas Davis and John Dillon, established the *Nation* as the organ of the Young Ireland party. The power wielded by this journal in stimulating opposition to British rule, led the government to include its editors in the indictment for sedition against Daniel O'Connell, 1844. They were convicted, but the House of Lords finally set aside the verdict. Two years later O'Connell quarreled with the Young Ireland party, who thereupon reorganized under the name of the Irish Confederation. With other members of that body, D. was tried for treason felony, 1848, but was acquitted. He then revived the *Nation*; founded the Irish tenant league; was elected to the House of Commons, 1852; established the Independent Irish party; but on account of the opposition of the ultra Rom. Catholics, resigned, 1856, and emigrated to Australia, where he took up the practice of the law. He became minister of public works in Victoria, 1857, entered the parliament there, and was prime minister, 1871. He was knighted, 1868; and, 1877, was elected speaker of the Legislative Assembly. He has published *Ballad Poetry of Ireland*; *Young Ireland: a Fragment of Irish History*, 1840-50; *Four Years of Irish History*, 1845-1849 (1883); *Conversations with Carlyle* (1892), etc.

DUFOUR, GUILLAUME HENRI, a Swiss general, b. at Constance in 1787, of a Genevese family. While Switzerland formed part of France, he studied at the Polytechnic school of Paris for two years; and on leaving it, he received an appointment as an officer of engineers in the French army. At the fall of Napoleon, he entered the Swiss service, and rapidly rose to the rank of col. When the government survey of Switzerland was undertaken, he was appointed director—at the same time acting as the principal of the Swiss military school at Thun. In 1840 he published *A Treatise on the Artillery of Ancient and Mediæval Times*; and in 1842, *A Manual of Military Tactics*. In 1847 he was raised to the rank of gen., and intrusted with the command of the army employed against the Sonderbund. He defeated their forces at Freiburg (13th Nov.) and at Lucerne (24th Nov.); and by his promptitude and skillful manoeuvres, secured a triumph for the liberal party in time to prevent the interference of foreign powers, diplomatically or otherwise. The diet voted him a gift of 40,000 francs, and for a time he was the most popular man in Switzerland. His politics were not, however, those of the Genevese democrats, and in 1848 they deprived him of the public offices he had previously held. In 1856, he was again admitted to the council of Geneva, and sent on a special mission to Louis Napoleon (see KERN, J. CONRAD). He d. in 1875.

BUGDALE, Sir WILLIAM, a celebrated antiquary and historian, was b. in 1605 at Shustoke, near Coleshill, Warwickshire. He was educated for some time at the free school of Coventry, but left it at the age of 15, and continued his studies under the care of his father, who, having a decided predilection for the branches of civil law and history, seems to have encouraged similar tastes in his son. His antiquarian pursuits led to his being created (1638) a pursuivant-at-arms extraordinary by the name of Blanche Lyon; and shortly afterwards, he was made Rouge Croix pursuivant-in-ordinary. During the civil war, D. adhered to the royal cause, and lived for several years in Oxford, employed in researches for his great works. On the restoration, D. was made Norroy king of arms, and in 1677 Garter king of arms; at the same time, the king, much against the wishes of D., whose estate was but a poor one, conferred upon him the honor of knighthood. He died at his estate of Blythe hall, Feb. 10, 1686. His chief works are *Monasticon Anglicanum* (Lond. 1655-61-73), (which, though for the most part written by another antiquary, named Dodsworth, was concluded, arranged, indexed, and corrected by D.); a new and greatly enlarged edition of the *Monasticon* by Bandler, Caley, and Ellis, was published in 1817-30, and reissued in 1846; *The Antiquities of Warwickshire* (1656; second edition revised and continued, 1730); *The Baronage of England* (1675-76); *Origines Juridicales, or Historical Memoirs of the English Laws*, etc. (1666; third edit. 1680); *Short View of the Late Troubles in England* (Oxford, 1681); *The Ancient Usage in Bearing Arms* (1683; new edition, 1811). D. bequeathed upwards of

27 folio MS. volumes, written in his own hand, to the university of Oxford. They are now in the Bodleian library, the Herald's college, and the Ashmolean museum.

DUGONG', *Halicore*, a genus of mammalia, of the family *manatiæ* (q. v.), or herbivorous cetacea, distinguished by molar teeth with flat summits, and composed of two cones laterally united, the incisors of the upper jaw elongated almost into tusks; the tail forked or crescent-shaped; and the swimming paws destitute of any vestiges of nails. One species alone has been thoroughly ascertained and accurately described. The *D. (H. indicus, or H. dugong)* of the Indian archipelago is said to attain a length of 20 ft. when full grown, although it is more frequently seen of only 8 to 12 ft. long. In general form, it much resembles the manatee. The skull is remarkable for the sudden bending downwards of the upper jaw almost at a right angle. The upper lip is large, thick, and fleshy, covering the prominent incisors, and forming a kind of snout, "something like the trunk of the elephant cut short across." The eyes are very small, and are furnished with a third eyelid or *nictitating membrane*. The skin is smooth and thick, but yields no oil. The anatomy of the *D.* has been very carefully examined. It exhibits a very remarkable peculiarity, in the ventricles of the heart being completely detached from one another. Its osteology has been found to exhibit interesting points of correspondence with that of the *pachydermata*, as in the numerous ribs, etc.; its dentition resembles in some particulars that of the elephant; its digestive apparatus is adapted to vegetable food, differing very much from that of the whales, dolphins, and other ordinary cetaceans. It feeds on the algæ which grow on submarine rocks in shallow seas. Its lips are of much use in gathering together its food. It often comes to the surface to breathe, and is said to utter a peculiar cry. It is gregarious. The female produces one young one at a birth, and shows an affection for it which is proverbial among the Malays. When the young one is taken, the mother is easily secured. The *D.* is generally pursued in boats, and killed by spearing. The flesh is highly esteemed even by Europeans, and is described as resembling young beef. That of full-grown animals is, however, comparatively coarse, on which account, and the greater facility of capture, the younger ones are more frequently killed. According to Rüppell, it was with the skin of the *D.* of the Red sea that the Jews were directed to veil the tabernacle.

DUGUAY TROUIN, RENÉ, one of the most celebrated naval officers of France, was b. 10th June, 1673, at St. Malo, left the school at Caen, where he was to have studied theology, with the reputation of a good-for-nothing fellow, and betook himself to the sea. His career, which was very brilliant, may be divided into two parts, the first extending from 1689 to 1697, and the second from 1697 to the close of his life. During the former, he cruised about as a sort of privateer, inflicting immense damage on the enemies of France. The English merchantmen suffered severely from his attacks. In the channel, on the coasts of Ireland and Holland, in the Spanish Main, everywhere fortune followed Duguay. Louis XIV., as a reward for his daring exploits, admitted him into the state navy, and gave him the command of a frigate. The second part of his career was as brilliant as the first. In 1707, he engaged a part of the English fleet at the entrance of the channel, burned 1 ship, captured 3 others and about 60 transports; but the most glorious of his triumphs was the attack and capture of Rio Janeiro in 1711, after hostilities had lasted for 11 days. The city was ransomed for 610,000 cruzades. The South American expedition of D. T., which cost Portugal in all about 30,000,000 francs, put the seal to the celebrity of the French commander. He was successively named *chef d'escadre*, member of the council of the Indies, lieutenant-gen., and naval commandant at Brest. In 1731, Louis XV. sent D. T. into the Levant, to chastise the barbarians inhabiting the neighboring coasts, and to obtain reparation for the damages done to French commerce. In this also D. T. was successful. He died 27th Sept., 1736. His *Mémoires* were published by Beauchamps (4 vols., Paris, 1740).

DU GUESCLIN, BERTRAND, 1314-80; constable of France, and the most famous French soldier of the age. He was so remarkable for ugliness, when a child, as to be an object of aversion to his parents. He gained his first reputation as a soldier in 1338 at a tournament to celebrate the marriage of Charles of Blois with Jeanne de Penthièvre, at which he unseated all the famous competitors. Becoming a soldier of fortune under Charles, he gained great distinction at the siege of Vannes in 1342. He was knighted, and in 1351 went, with the lords of Brittany, to England to secure the release of his captive master. He gallantly relieved Rennes, besieged by the duke of Lancaster in 1356, and by his help the city held out till the truce of Bordeaux in June, 1357. He soon took service under the French king, and, after several brilliant actions, was made marshal of Normandy and count of Longueville. At the battle of Auray, in 1364, he was taken prisoner, but he was ransomed for 100,000 crowns; and becoming commander of the grand companies, led them into Spain, where he placed Henry of Trastamare on the throne of Castile in 1366. In the next year he was taken prisoner by the Black Prince, then in alliance with Pedro the Cruel. Being again ransomed, he again restored Henry to the throne in 1369. In 1370, he was made constable of France, and for ten years was active and successful in driving the English from the s. and w. of France. In 1373, he seized and held the duchy of Brittany. He died while besieging the fortress of Châteauneuf-Randon. The garrison had already agreed to capitulate, and their commander led them out, and placed the keys of the castle upon the coffin of the constable.

DUHAMEL, JOSEPH, Canadian barrister, was b. Montreal, 1836. He was educated at the Jesuits' College, Montreal, and was admitted to the bar in 1857. He soon became one of the foremost advocates in Canada, winning a wide reputation as a profound lawyer and eloquent orator.

DUHAMEL, JOSEPH THOMAS, was born in Contrecoeur, Verchères co., Canada, in 1841, was prepared for the priesthood by the Oblate fathers, and ordained in 1863. In 1869 he went to the Vatican. He was made bishop of Ottawa in 1874, and spent much time in the development of the college of Ottawa. He was made a count of the holy Roman empire in 1872 and was created first archbishop of Ottawa in 1886.

DUHAMEL DU MONCEAU, HENRI LOUIS, 1700-82; a French botanist. For discovering the disease which was destroying the saffron plant (a parasitical fungus attacking the roots), he was made a member of the academy of sciences. Alone, and with Buffon, he made many experiments in vegetable and animal physiology, and the influence of the weather on agricultural production. Late in life he was appointed inspector-general of marine.

DUILLIAN COLUMN, erected in the forum at Rome in honor of the naval victory of C. Duilius. The name *rostrate* was given to columns commemorating naval victories (from *rostra* the beak of a ship), as they had on each side projections in the form of such beaks. Michael Angelo restored this column, and his restoration is in the Palazzo de' Conservatori, on the Capitoline hill. Its pedestal retains a portion of the original inscription.

DUISBURG, a t. of Rhenish Prussia, about 15 m. n. of Düsseldorf, is situated in a fertile district, between the Ruhr and the Rhine, with both of which it is connected by a canal. It is surrounded partly by walls, flanked with towers, which are now somewhat decayed, and partly by a rampart and ditches. D. contains a gymnasium founded in 1599, a monastery of Minorites, and five churches, two of which—that of St. John the Baptist, dating from 1187, and St. Salvador's, are worthy of notice. Its manufactures are numerous and important; including tobacco, soda, sulphuric acid, and other chemicals, iron castings, soap, starch, and sugar; there is also a large trade in wine and colonial produce. In the neighborhood are iron-works and coal-mines. Pop. '95, 70,287. D. is an ancient town. In the 13th c., it was a member of the Hanseatic league, and afterwards a free town of the German empire, but at the close of the war in 1815 it was handed over to Prussia.

DUKE (Fr. *duc*, Lat. *dux*, from *ducere*, to lead), a term applied originally to any military leader. Gibbon informs us that the title came first into use when Constantine separated the civil and the military commands in the provinces, which had been exercised in common by such men as Agricola. From that time forth, the military governors of provinces were either counts or dukes. But these titles originally stood to each other in an opposite relation to that which they afterwards assumed. "It should be recollected," says Gibbon (iii. 57, cap. xvii), "that the second of these appellations—that of D.—is only a corruption of the Latin word, which was indiscriminately applied to any military chief. All provincial generals were therefore *dukes*, but no more than ten among them were dignified with the rank of *counts*, or companions, a title of honor, or rather of favor, which had been recently invented in the court of Constantine." See COUNT. "A gold belt," continues Gibbon, "was the ensign which distinguished the office of the counts and dukes; and, besides their pay, they received a liberal allowance, sufficient to maintain 190 servants and 158 horses. They were strictly prohibited from interfering in any matter which related to the administration of justice or the revenue; and the command which they exercised over the troops of their department, was independent of the authority of the magistrates." When the Goths, and Franks, and other barbarians successfully invaded the provinces of the empire, they preserved the titles of count and D., if they had not already borrowed them from the Romans. But amongst races who owed their supremacy to the sword, no dignity could prevail over that of the commander of an army; and the dukes, as military chiefs, acquired a marked pre-eminence over the counts, whose lofty functions under the empire had been partly of a civil, and partly of a military nature. The only exception under the first Merovingians was in the case of the count of the palace. See COUNT. In the hierarchy observed by the Franks and other Teutonic races, the ordinary count became the lieutenant of the D., and the government of the latter extended to several provinces; whereas that of the former was confined to one province, or even to a single locality. The power of the dukes grew so rapidly, in consequence of the dissensions of the Merovingians, that, towards the end of the 6th c. (582), they arrogated to themselves the right to dispose of the crown. Amongst the causes which tended to raise the power of the dukes, was the immense wealth which had been acquired by the great provincial families. The chiefs who had attached themselves to the fortunes of Clovis had been richly endowed with conquered lands. After the close of the 7th c., they overshadowed the crown, and the title of prince and chief (*chef*) began to be attributed to them. It has been said that the *ducs-maires* of the palace sometimes assumed the title of archduke (q.v.). Under the second dynasty, the title of duke retained all its dignity and importance, and it was to the successive invasions of local upon central power, that feudality owed its origin.

The concession, tacit or express, of hereditary power and independent jurisdiction, first to the central province known as the Isle of France, and then to Aquitaine, extended itself, under the Carolingians, to Burgundy, Normandy, and Gascony; and on the accession of Hugo Capet, to all the other subaltern tenures. Once become unlimited masters of their respective legations, the dukes did not long delay to proclaim their title to be as good as that of the king. They assumed the crown and the scepter, promulgated laws for their subjects, struck money with their own image, and made war in their own name against the crown, with whom they balanced and several times divided the supreme authority. The confederation of the feudal lords had assumed such dimensions, that about the period of the Norman invasion of England nothing remained directly under the crown except a few towns, of which Rheims and Laon were the chief. The rest of the kingdom was divided amongst the dukes and the counts, under an obligation, which they almost always evaded, of service and fidelity to the crown. But the Capetians had been enlightened by the fall of two dynasties, and were careful to delegate to no other hands the duchy of the Isle of France, which had so often been a stepping stone to the throne. When it became extinct in 887, it was not re-established, and that event was the signal for the restoration of a national character to France. The duchy of Gascony was joined to Aquitaine in 1052; and both provinces, along with Normandy, were finally re-united to the crown, in 1204, by confiscation. This latter duchy was sometimes given to princes of the blood, but without any separation of its fiscal arrangements from those of the kingdom. A part of Aquitaine was given up to England in 1259, and again ceded to France in 1453. The ducal sovereignty of Burgundy was extinguished in 1477, that of Brittany in 1514, of Narbonne in 1229, and of Toulouse in 1361.

The duchies which were subsequently granted to members of the royal family—that of Bourbon, erected in 1327; of Orleans, in 1344; of Auvergne, Berri, Touraine, Valois, and Alençon, at subsequent periods—enjoyed none of the privileges of independent sovereignty which had belonged to the ancient duchies. The subordination of these fiefs was absolute, and the princes who governed them, though placed on the steps of the throne, were only the first subjects of the realm. The tendency to diminish the actual power which anciently had attached to the ducal title, was still more apparent in the case of those dukedoms which were conferred on the representatives of illustrious noble families. The Montmorencies were created dukes in 1551, but they enjoyed no other privileges than those of titled nobles, and their position had no analogy whatever to that of the old provincial dukes. The duke-peers, as they were called, were simply the first class of nobles in France, just as dukes are with us in England; but they differed from English dukes, in that, after the extinction of the Comté Pairie d'Eu, in 1775, the duke-peers alone sat in parliament. Several prelates enjoyed this rank—as, for example, the archbishop-duke of Rheims, the bishop-duke of Laon, and the bishop-duke of Langres. The archbishop of Paris took the same rank after the erection of St. Cloud into a ducal peerage in 1674. There were still two other sorts of dukes in France—the dukes who were not hereditary peers, and the dukes for life, or patent dukes, who date only from the reign of Louis XIV. Swept away by the revolution, the title was restored by Napoleon, who conferred it, with rich endowments, on his marshals. Several ducal peers were created by Louis XVIII. and Charles X.

In Germany, the dukedom passed through phases very similar to those which it exhibited in the earlier history of France. What is special to the position of the nobility of that country, will be stated under *GRAF* (q.v.).

Dukes, in the older European sense, do not appear ever to have existed in England. The title seems not to have been known earlier than the reign of Edward III., and from the first it was a mere honorary distinction. The Black Prince, who was created D. of Cornwall (see below) in 1335, was the first English duke. In 1350, Henry, the king's cousin, was created D. of Lancaster; and when he died, and his daughter was married to John of Gaunt, the king's son, the title was transferred to him—his elder brother, Lionel, being made D. of Clarence. In the succeeding reign—that of Richard II.—the two younger sons of Edward III. were created, the one D. of York, and the other D. of Gloucester. The dignity was thus, in the first instance, confined to the royal house. But the families of Holland and Mowbray very soon received the same title; and one of the Beauforts, an illegitimate son of John of Gaunt, was raised to the peerage by the title of D. of Exeter. In the reign of Henry VI., the title was granted more widely, and there were at one time ten duchesses in his court. The Staffords, Beauchamps, and De la Poles, belong to this period. King Henry VIII. created only two dukes—the one was his illegitimate son, whom he made D. of Richmond; and the other Charles Brandon, who married his sister, the French queen, and was made D. of Suffolk. Queen Elizabeth found only one D. when she came to the throne—Thomas Howard, D. of Norfolk—attainder or failure of male issue having extinguished the rest of them. After the attainder and execution of the D. of Norfolk, there was no D. in England, except the king's sons, till Ludovic Stuart, a relative of the king's, was made D. of Richmond in 1623. In 1623, Villiers was made D. of Buckingham. On the restoration, Charles II. restored the Seymours to the rank of dukes of Somerset, and created Monk D. of Albemarle. But the habit of conferring this dignity on the illegitimate sons of

the monarch was still adhered to, as in the case of the D. of Monmouth, who was the illegitimate son of Charles II.; and the D. of Berwick, of James II. Of the existing dukes besides the descendants of Charles II., there are only three families which date their dukedoms before the revolution—viz., the Howards, the Seymours, and the Somersets. It was William and Anne who, by advancing a very considerable number of the first families of peers to the rank of D., altogether changed its character. There are now 11 English dukes, 7 Scotch, 5 of Great Britain, 6 of the United Kingdom, and 2 Irish. These numbers do not include dukes of the blood-royal.

The DUCAL CORONET is composed of a circle of gold, with eight strawberry or parsley leaves, of equal height above the rim.

DUKE OF CORNWALL. The duchy of Cornwall was by royal charter of Edward III. conferred on his son Edward the black prince. King Henry IV. subsequently included the D. of C. in a patent in favor of his son Henry prince of Wales. But since that time, the duchy has belonged of right, without any special grant, to the king's heir-apparent from the time of his birth. On the death of the king's eldest son without issue, during the life of his father, the duchy descends to the next brother. In the event of the death of the heir-apparent without issue, and without leaving a younger brother, or in case the heir-apparent succeeding to the crown, the duchy of Cornwall merges in the crown until the birth of a son calls it again into existence. The uncertainty thus arising in regard to the duchy has produced much confusion in regard to leases held of the D., and various acts of parliament have been passed, from the 21 James I. to the reign of the present queen, to regulate this matter. The D. of C. formerly possessed "royal jurisdiction and crown rights, giving liberty to send burgesses to parliament, and appointing the sheriffs, admirals, and other officers."—Carew's *Cornwall*. At the present day, there is a separate chancellor, and attorney and solicitor general for the D. of Cornwall. The revenues of the duchy are considerable, arising partly from the rents, etc., of the different manors, and partly from the dues on tin, which is produced in large quantities from the Cornish mines. There is a special court for the settlement of questions arising among the miners, called the stannaries court (q.v.). See STANNARIES.

DUKE OF EXETER'S DAUGHTER, an instrument of torture resembling a rack, said to have been invented by the dukes of Exeter and Suffolk during the reign of Henry VI. This curious instrument was for some time preserved in the tower of London. Blackstone avers that it was never put into use.

DUKES, a co. of s.e. Massachusetts, consisting wholly of islands in the Atlantic ocean; in all, about 124 sq.m.; pop. '90, 4369. Martha's Vineyard is the largest island, and is about 5 m. from the mainland. There is some agriculture, but the chief business is fishing and commerce. Co. seat, Edgartown.

DUKE OF YORK'S SCHOOL is the popular designation for the *Royal Military Asylum* at Chelsea. In the French army, there have long been *enfants de troupe* borne on the books of each company or battalion of soldiers; that is, children of deceased soldiers, unprovided with other homes. In England, no such system prevails. The late duke of York, in the year 1801, used his influence to obtain the formation of a soldiers' orphan asylum. Accommodation was obtained at Chelsea; and in 1803, schools were opened for 700 boys and 300 girls, children of deceased soldiers. The institution has been kept up ever since for the boys, of whom 500 are now maintained, but was a failure as to the girls. The boys are wholly supported as well as educated. They are not bound to serve the state after they leave the asylum; but most of them nevertheless enter the army. A soldier's son has not a *right* of admission; a selection is made according as vacancies may occur. When the boys leave the school, those who do not enter the army are apprenticed to trades. The asylum is under a board of commissioners, who make the necessary rules and regulations. The chief officers are the commandant, secretary, quartermaster, head-master, chaplain, surgeon, and dispenser.

The expenses are defrayed by an annual parliamentary grant, included in the army estimates.

No provision is now made by the state for the *daughters* of deceased soldiers. The girls admitted into the asylum in the early years of its history, brought discredit to it by their after-life; and this part of the system was abandoned. There is only a royal patriotic fund asylum on Wandsworth Common, unaided by the state, for soldiers' orphan daughters; it originated during the Crimean war.

DUKINFIELD, a township in the n.e. of Cheshire, 42 m. from Chester, and separated from Ashton-under-Line in Lancashire by the Tame. It has large cotton-factories, iron-foundries, fire-brick and tile-works, and collieries. The township contains one of the deepest coal-mines in the world. Pop. '81, 16,943; '91, 17,408.

DULCAMA'RA, the young branches of the bitter-sweet or woody night-shade (*solanum dulcamara*), a perennial plant of the order solanacæ. The dried branches, sold by the druggists, contain an alkaloid, solanine, besides a sweet and bitter principle, dulcamarine or picroglycion, and other matters. It is feebly narcotic, with power to increase the secretions, particularly of the kidneys and skin. It sometimes produces a dark purple color of the face and hands, with languid circulation of the blood.

DULCIGNO, a t. and seaport of European Turkey till 1880; now in Montenegro, on the shore of the Adriatic, 15 m. s.s.w. of Scutari. The inhabitants were long notorious for piracy, but are now more creditably engaged in the oil and coasting trade. D. is the seat of a Catholic bishop. Pop. about 7,000.

DULCIMER, a musical instrument resembling a flat box, with sounding-board and bridges, strung with thin wire, and played on by striking the wires with a small piece of wood in each hand.

DULONG, PIERRE LOUIS, 1785-1838; b. Rouen, France. His attention was given chiefly to natural sciences, and he made many valuable and some dangerous experiments in chemistry, losing a finger and an eye in his search for knowledge. He investigated the phenomena of animal heat, in company with Berzelius and Berthollet. With Arago he studied several years the elastic power of steam at different temperatures, trying to find preventives of steam-boiler explosions.

DULSE, *Rhodomenia palmata*, a sea-weed, one of the *ceramiaceæ* (q. v.), growing on rocks in the sea, and used as food by the poor on the coasts of Scotland, Ireland, and other northern countries, and of the Grecian archipelago, occasionally also as a luxury by some of the wealthier classes who have acquired a taste for it. It has a purple, leathery, or somewhat membranous, veinless, sessile frond, irregularly cut, with repeatedly forked segments, which are either entire at the edges, or furnished with lateral leaflets, the spores distributed in cloud-like spots over the whole frond. The name D. is also given in the s.w. of England to another sea-weed *iridea edulis*, also one of the *ceramiaceæ*, which has an undivided, obovate or wedge-shaped, flat, expanded frond, very succulent, tapering to a short stalk, and of a dull purple color. It is occasionally employed as food both in the s.w. of England and in Scotland. **PEPPER DULSE**, *Laurentia pinnatifida*, another of the *ceramiaceæ*, has a compressed cartilaginous frond, twice or thrice pinnatifid. It has a pungent taste, and is used as a condiment when other sea-weeds are eaten.

DULUTH, city, port of entry, and co. seat of St. Louis co., Minn.; at the mouth of St. Louis river, and at the western extremity of lake Superior; 165 miles n. of St. Paul; area, 67.25 sq. miles. It was named after Capt. Jean Du Luth, a French traveler, who built a hut here in 1760; was settled on the part known as Minnesota Point; was chartered as a city in 1869, and was subsequently enlarged by the annexation of the suburbs of Lake Side and West Duluth. The city is especially favored with facilities for transportation by rail and water. It is on the Chicago, St. Paul, Minneapolis, and Omaha, the Duluth, and Iron Range, the Duluth and Winnipeg, the Duluth, Mesabe, and Northern, the Duluth, South Shore, and Atlantic, the Duluth Transfer, the Great Northern, the Northern Pacific, and the St. Paul and Duluth railroads. It has an excellent double harbor, the outer one being protected by a breakwater built by the U. S. government, and the inner one by the strip known as Minnesota Point. The inner harbor is entered through a ship canal, and between Minnesota and Rice's points is a dyke with a passage for vessels, which protects the bay from the obstructions of the entrance channel. The U. S. government has adopted plans for greatly improving the harbor, which will make it nearly 10,000 feet long by about 2,000 feet wide, and provide a dock front on the inner harbor and St. Louis bay of about 100 miles. The port is connected by several lines of steamers with all important points on the great lakes, and has a large and steadily increasing commerce in grain, iron ore, coal, lumber, and other commodities of the region. Its trade by water is largely facilitated by the Sault Ste. Marie canal, whose traffic now greatly exceeds that of the Suez canal, and the city has gained third place among the ports of the United States in the number of entrances and clearances of vessels. Duluth is the seat of a Protestant Episcopal and a Roman Catholic bishop; contains over 50 churches, and has St. Luke's, St. Mary's, the Women's, and several private hospitals, central high school (cost \$350,000), more than 30 other public school buildings, several convents and parochial schools, a state normal school, and public, law, and school libraries. There are gas and electric light plants, electric street railroads, a magnificent boulevard on the hill back of the residence portion, numerous parks and lake drives, water-works supplied from the lake with large reservoirs, national and state banks, and a large number of daily and weekly periodicals. While the city is a great commercial centre, it also has important manufacturing interests, using a capital of over \$5,000,000, and having an output valued at over \$9,000,000. Its docks, especially those for handling iron ore, coal, and grain, are among the largest in the world. Pop. '90, 33,115.

DULWICH, a suburb of London, in the n.e. of Surrey, $4\frac{1}{2}$ m. s.s.e. of St. Paul's cathedral, and near Sydenham. It is a fine rural spot, has many genteel residences, and is noted for its college and picture-gallery.

DULWICH COLLEGE, or God's gift, was founded in 1619 by Edward Alleyne, a tragic actor. It maintains a large number of poor brethren and sisters and foundation scholars. In 1870 it was removed to a new building. The age limits of the scholars are 10 and 19 years. A considerable sum is applied to scholarships, which are competed for in open examination.

DUMAS, ALEXANDRE, a French novelist, was the son of the republican general, Alexandre Davy-Dumas, who was himself the offspring of the marquis Davy de la Pailleterie and a negress. The crisp hair and thick lips of D. bore testimony to his African origin, a testimony which is confirmed by the savage voluptuousness and barbaric taste displayed in many of his compositions. D. was born at Villers-Cotterets, 24th July, 1803. His father died when he was quite a child, and he received in consequence a very imperfect education. At the age of 20, he came to Paris to seek his fortune, and after a short time received an appointment in the household of the duc d'Orleans. In 1826, he first appeared as an author in a volume of *Nouvelles*; but it was not till 1829, when his historical drama, *Henri III. et sa Cour*, was brought upon the stage, that France fairly mistook him for a genius. This work appeared at the time when *romanticism* was beginning to triumph over *classicism* in French poetic literature, and was hailed by the advocates of the former as a crowning victory. The duc d'Orleans, who was delighted with the production, led the applause, on the first night of its representation, in honor of the author. Next morning, D. was made librarian to his highness. From this period, he became more and more a noted character in Paris, dexterously contriving at once to feast the appetites of the mob, and to continue the companion of princes. In 1846, he accompanied the duc de Montpensier to Spain, as the historiographer of his marriage. Afterwards, he visited Africa; and on his return to Paris, finding his income inadequate to meet the expenses of his costly mode of life, he opened a theater of his own. The revolution induced him to attempt a political career; but France, in spite of its discreditable admiration of this literary Cagliostro, had sufficient good sense to turn the cold shoulder to him. In 1853, "financial considerations" compelled him to seek refuge in Belgium. Subsequently, his pecuniary star being once more in the ascendant, D. visited the east. After the conquest of Sicily by Garibaldi in 1860, he followed in the wake of the great liberator, who does not seem, however, to have been imposed upon by his mountebank worship and bombastic enthusiasm.

It would require pages to enumerate all the productions which have been issued under the name of D.; but for two reasons, this is unnecessary: first, they are for the most part worthless, and second, they are for the most part not *his*. M. Alphonse Karr, in his *Mercantilisme Littéraire* (1845), and M. Eugène de Mirecourt, in his *Fabrique de Romans, Maison A. Dumas et C^{ie}* (1845), have exposed the astounding quackery of this writer. It would seem that D. had introduced the *sweating-system* into literature, for he had in his employment a large number of poor authors and literary hacks, whose circumstances or position hindered them from demanding a legitimate emolument for their labor. To these persons, D. was in the habit of giving a few brief outlines of a novel or drama, and then paid them for composing the work, which appeared as the production of D.'s miraculous pen. Thus it happened that D. sometimes contrived to issue more volumes in a year than it was possible for a human being to transcribe in the same period. His best known works are *Les Trois Mousquetaires* (8 vols., 1844), *Le Comte de Monte Cristo* (12 vols., 1841-45), *La Reine Margot* (6 vols., 1845). His *Mémoires*, commenced in 1852, only confirm the impression of his character which one derives from the perusal of his books. Altogether, it may be said that the appearance in literature of a writer like D. is a portentous phenomenon; and the avidity with which his immoral fictions are devoured, is the most severe condemnation of modern, and especially French, society that could well be pronounced. He died 5th Dec., 1870.

DUMAS, ALEXANDRE, known as **DUMAS THE YOUNGER**, or **DUMAS FILS** (1824-95), the son of the preceding, was b. in Paris, and began to write at an early age, publishing a book of poems, in 1847, which had little merit. After accompanying his father in his travels, he published *Aventures de Quatre Femmes et d'un Perroquet* (1847), and *La Dame aux Camélias* (1848). The last has continued the best known of all his works. Like most of Dumas' writings it is a novel with a purpose, the object being to show the possibility of the persistence of a pure love in a member of the *demi-monde*. Subsequently dramatized, it has become one of the most popular plays on the stage, retaining its interest to the present time. Sara Bernhardt and Eleanora Duse are among the actresses who have appeared in its title rôle. D. wrote afterwards many plays, most of which present some radical theory of life or society, or deal with some psychological problem. They are all characterized by brilliant dialogue, clever situations, and a certain sensational mode of treatment, which has constituted alike their attraction and their defect. They always deal with the men and women of the present day. The dramatic construction is simple, and there is often no change of scenery from the beginning of the play to the end. The characters are real, but the wit and eloquence of the author make them speak in a manner most unlike that ordinarily heard in society. There is a rigorous logic in the development of the plot, and the conclusion seems inevitable. Among the best known of these plays are *Le Demi-Monde* (1855); *Le Fils Naturel* (1856); *Les Idées de Mme. Aubray* (1867); *Visite de Noces* (1871); *Monsieur Alphonse* (1877); *L'Étrangère* (1876); *Denise* (1885); *Francillon* (1887). He was elected to the French Academy in 1874, and made a commander of the Legion of Honor in 1888.

DUMAS, JEAN BAPTISTE, a distinguished French chemist, was b. at Alais, in the department of Gard, in 1800. He was at first apprenticed to an apothecary in Geneva, and engaged in some scientific investigations that attracted the attention of Decandolle and Prévost. In 1821 he went to Paris, and was appointed chemical *répétiteur* (tutor) in the polytechnic school, and then professor of chemistry in the athénæum. He was

afterwards removed to the Sorbonne, and made a member of the institute. His researches in organic chemistry, on atomic weights, sulphuric ether, and the law of "substitutions," attracted attention over all Europe. D. is not merely an expert chemist, but an able and bold thinker, and eloquent expounder, who has the art of making science attractive, and of captivating his hearers. During the July monarchy, he was a member of the council of education. After the revolution of Feb., he was chosen a member of the legislative assembly; and from 1849 to 1851, he held the portfolio of agriculture and commerce. After the *coup d'état*, he was made a member of the senate and of the superior council of public instruction, (see a sketch of his life in *Nature*, 1880). Numerous contributions from his pen are contained in the *Annales de l'Industrie* and other scientific journals, and in the *Mémoires de l'Académie*. His chief works are *Traité de Chimie appliquée aux Arts*; *Leçons sur la Philosophie Chimique*; *Essai sur la Statique Chimique des Êtres Organisés*, etc. D. delivered the first Faraday lecture before the London Chemical Society, in 1869. He was elected a member of the French Academy in 1876. He d. in 1884.

DUMAS, MATTHIEU, Count, 1753-1837; a French soldier and military historian. He entered upon active service in the army in 1780 as aid to Rochambeau, commander of the French force sent to the aid of the Americans then in revolt against England. He was in a number of engagements, including the capture of Yorktown. After peace, he returned to France. In the revolution of 1789, he acted with Lafayette and the constitutional liberal party. In 1791, he was elected to the assembly, and the next year was chosen president of that body. During the reign of terror he absented himself from France, with some brief intervals. In 1797, he was proscribed as a monarchist, and fled to Holstein. When Bonaparte became first consul he was recalled, and appointed chief of staff to the army of Dijon. He was subsequently counselor of state, and grand officer of the Legion of Honor, whose organization he defended before the Corps Législatif. He went with Joseph Bonaparte to Naples, and was made minister of war. In 1808-9, he served in the French army in Spain and Germany, and after the battle of Wagram he was employed in negotiating the armistice. He was intendant-general of the army in the Russian campaign, an office which involved the charge of the entire administrative department. He shared the horrors of the retreat from Moscow, took part in the battles of Lutzen and Brantzen, and after the defeat at Leipsic was employed to negotiate the capitulation; but his terms were not accepted by the allied powers, and he was arrested and imprisoned until the conclusion of peace in 1814. He was in favor under the temporary restoration, and held important commissions. When Napoleon returned from Elba, Dumas was intrusted with the organizing of the national guards. This put him out of favor with the Bourbons, and when Louis XVIII. was finally restored, he was obliged to retire on half-pay. He then finished his review of military events, in 19 vols., embracing the history of the war from 1798 to 1807. In 1818, he was restored to favor, and made a member of the council of state; in 1828, he was a deputy in the assembly from Paris. After the events of 1830, he was made a peer, and re-entered the council of state as president of the war committee.

DU MAURIER, GEORGE LOUIS PALMELLA BUSSON, b. Paris, 1834. His parents were English though his father was of French descent. He went to England at the age of 17 years, studied chemistry, but returned to Paris and entered the studio of the artist Gleyre. He was employed as a draughtsman on several of the English illustrated monthlies; illustrated *Henry Esmond*, Black's *Three Feathers*, and other books; but is best known by the social caricatures which he has contributed to *Punch*. He contributed a monthly drawing to *Harper's Magazine*, and wrote (1891) a novel, *Peter Ibbetson*, of much originality and power, followed in 1893-94 by *Triby*, which had a most extraordinary circulation, especially in the United States, and the *Martian*, 1897. He d. in 1896.

DUMB. See DEAF AND DUMB.

DUMB AGUE, a common name, although not unscientific, of masked ague, or a form of intermittent fever, in which the prominent symptoms, as the shaking chill, and the succeeding violent fever, are not present, or the tendency to them only slightly indicated. It is sometimes applied, though erroneously, to a much more serious and dangerous form, called pernicious, malignant, or congestive intermittent fever. See INTERMITTENT FEVER.

DUMBARTON, a royal, parliamentary, and municipal burgh, seaport, and chief town of Dumbarton co., is situated mainly on the left bank of the Leven, near its junction with the Clyde, and 13 m. w.n.w. of Glasgow. It is rather closely built, and chiefly consists of a long semicircular street, parallel to the river. The chief branches of industry carried on in the town of D. are ship-building, marine-engine and machine making, iron-forging, iron and brass founding, and rope-making. It has regular steam-communication with Glasgow, Greenock, and other Clyde ports. Pop. '91, 14,172. It unites with Kilmarnock, Renfrew, Rutherglen, and Port Glasgow in sending one member to parliament. D. is supposed to have been the Roman station Theodosia, and the capital of the kingdom of the Britons, on the vale of the Clyde. Alexander II., in 1222, made it a royal burgh. To the e. of the alluvial plain, at the mouth of the Leven, stands the famous and picturesque castle of Dumbarton, on a steep, rugged, basaltic rock, rising

to the height of 560 ft., a mile in circuit at the base, and forming nearly an island at high water. The rock almost hides the town of D. from the Clyde.

DUMBARTONSHIRE (anciently, Lennox, Levenax, or Leven's field), a sickle-shaped co. in the w. of Scotland, bounded e. by loch Lomond, Stirling, and Lanark; s. by Renfrew and the Clyde estuary; w., by loch Long and Argyle; and n., by Perth. It is 35 m. long, and 15 (average $7\frac{1}{2}$) broad, with 35 m. of coast; area, 297 sq. miles. On the e., it has a detached part of 12 sq.m., inclosed by Stirling and Lanark. The s. coast on the Clyde is mostly low and sandy. Loch Long forms 20 m. of the w. border. The Gare loch, one mile broad and 6 long, forms, with loch Long, the Roseneath peninsula in the s.w., studded with beautiful villas. Loch Lomond for 24 m. bounds the e. side of the co., the hills rising from a low, narrow, and wooded shore. Here is the romantic scenery of part of Rob Roy's country described by Scott. The n. of the co. is mountainous or hilly, rising in Ben Voirlich 3,300 ft. The scenery of D. is very romantic, and the co. forms the route to the w. highlands of Argyle and Perth. The ancient ferry from the lowlands to the highlands was between Port Glasgow and Cardross. There are many streams, and 9 fresh water lakes, the largest being loch Lomond. The chief rivers are the Clyde, along the s. border; and the Leven, the outlet of loch Lomond, and running 6 m. into the Clyde, at the foot of Dumbarton rock. The rocks are mica-slate, talc-slate, clay-slate, trap, coal-measures, and carboniferous limestone. The mineral products are coal, freestone, limestone, ironstone, and slates. The climate is mild and humid. The arable lands lie chiefly s. of loch Lomond, and along the Clyde e. and w. of Dumbarton Castle. Pop. '91, 94,511.

DUMB-BELL, is a name given to a weight used in calisthenic exercises. It consists of two balls of iron connected by a short iron bar for a handle. The present form of dumb-bell was in use in England as early as the reign of Queen Elizabeth; and weights called *halteres* that were similar to our dumb-bells were used by the quoit-players in the early Grecian games.

DUMB CANE, *Dieffenbachia seguina*, formerly called *arum sequinum* and *caladium sequinum*, a plant of the natural order *araceæ*, remarkably differing from the plants of that order generally in its almost arborescent character, but agreeing with them in its acidity, which is in none of them more highly developed. It has a cylindrical stem, with ringed scars and oblongo-ovate leaves. It is a native of the West Indies, and has received its English name from the property which it has of producing dumbness when chewed, its acrid poisonous juice causing an immediate swelling of the tongue, accompanied with excruciating pain. The juice is, however, sometimes used to effect the granulation of sugar. A decoction of the stem is used as a bath and fomentation in dropsy, and the root-stock is used in obstinate constipation.

DUMBNESS. See DEAF AND DUMB.

DUMB-WAITER, a set of circular shelves, turning on a pivot, on which dishes and table necessities are placed and brought within reach by turning the waiter on its axis; also, a movable framework, balanced with weights, so as to be easily operated by means of cords and pulleys, and employed to convey articles from one story of a house to another.

DUMDUM, the name of a t. and of a valley in India.—1. The town is well known in the military history of the country, standing in lat. $22^{\circ} 38'$ n., and long. $88^{\circ} 30'$ east. It is 10 m. to the s.e. of Barrackpore, and 8 to the n.e. of Calcutta, having extensive accommodations for troops, and a cannon-foundry. The place is famous in connection with the mutiny of 1857, as the scene of the first open manifestation on the part of the Sepoys against the greased cartridges.—2. The valley leads into Cashmere from the s. over what is called the Pir Panjal pass, whose crest is 11,800 ft. above the level of the sea. It is about lat. $33^{\circ} 45'$ n., and long. 75° east.

DUMFRIES, a royal, parliamentary, and municipal burgh, river-port, and county-town of Dumfriesshire, on the left bank of the Nith, 9 m. from its mouth in the Solway firth, 73 m. s. by w. of Edinburgh, and 33 w.n.w. of Carlisle. It stands on a rising ground, surrounded, except towards the sea, by fine, undulating hills, many of which are green to the top. It is an irregularly built town of red freestone, and is reckoned the capital of the s. of Scotland. Two bridges cross the Nith to Maxwelltown, a suburb in Kirkcudbright. One of the bridges is believed to have been built about 1280, by Devorgilla, the mother of John Baliol, and to have had 9 arches, although some antiquaries claim 13, with a central gate. It is largely, however, a structure of the 17th c.; only six of its arches now remain; and it is limited to foot-passengers. The most noticeable building in D. is the mid-steeple, in the center of the High street, which was at one time believed to have been erected by Inigo Jones; the architect is now, however, ascertained to have been Tobias Bachup, of Alloa. The very high tides of the Solway firth bring vessels of 40 tons up to the town, and larger ones to the river quays below the town. In 1875, 496 vessels of 25,675 tons entered, and 306 of 19,106 cleared the port. D. has three large and two small manufactories of woollen cloths (Tweeds); it manufactures hosiery, leather, baskets, and wooden shoes; and it has a considerable reputation for its dye-works, and the nurseries in its vicinity. The chief exports are woollen cloths, wool, hosiery, shoes, sheep, grain, wood, and bark. D. is noted for its markets, live-stock being here transferred from Scotch to English dealers. Pop. '91,

17,800. It unites with Annan, Sanquhar, Lochmaben, Kirkcudbright, and its suburb, Maxwelltown, in sending one member to parliament. D. arose, it is believed, in a castle, of which nothing now remains. The early Scotch and English kings had frequent contests for its possession. About 1200, a monastery was founded here, in the chapel of which Comyn was stabbed by Robert Bruce in 1305. The Highlanders, under Prince Charles, in 1745, fined D. £4,000, and plundered and burned it. Burns spent the last years of his life here as an exciseman, and the house he resided in, and the mausoleum erected to his memory, are among the most notable objects of the place.

DUMFRIESSHIRE, a border co. of Scotland, on the Solway firth, having Kirkcudbright on the west. It forms an irregular ellipse, 55 m. by 32, with 22 m. of coastline on the Solway firth, to which its surface slopes; area, 1063 sq. m. The n. half is mountainous, rising, in Hartfell, 2,650 ft.; Lowther Hills, 2,377; Black Lark, 2,231; Ettrick Pen, 2,258; and Queensberry, 2,285. The s. part is undulating. The country on the Solway firth (q. v.) for 10 m. inland is flat, sandy, and gravelly, with tracts of "cobbles," or large stones. D. is drained principally by three rivers—the Nith, 45 m. long; the Annan, 40; and the Esk, 40; which run s.e. and s. into the Solway firth from the n. border of the co., and divide it into three districts or dales, called after the rivers. There are many small lochs, three of them near Lochmaben, containing vendace. D. consists of Silurian, permian, and carboniferous strata, with eruptions of trap. Tor-toise footprints have been found in the new red sandstone of Annandale, at Corncockle. The mineral products are coal, limestone, ironstone, lead, and silver. There are extensive lead-mines at Wanlockhead, 2 m. from Leadhills, in Lanarkshire. Gold has been obtained in quartz veins in the hills near Wanlockhead; a mass of 5 ozs. found there is now in the British museum. Limestone is quarried in the parishes of Keir and Carmertrees; zinc ore is mined at Abington, and coal at Sanquhar and Canonbie. There are noted sulphureous springs at Moffat, and chalybeate ones at Hartfell. The climate is moist and mild, and most of the land has a southern exposure. There are rich alluvial tracts along the rivers and on the Solway firth. The Lochar Moss, a peat tract on the Solway firth, is 13 by 2 to 3 m., and contains shells, trees, and fragments of ships. The chief occupations are agriculture, and the rearing of cattle, sheep, and pigs. Sheep-farms occupy the hills. The chief exports are cattle, sheep, grain, wool, hams, and bacon. There are fisheries of salmon in the rivers. In 1881, D. had 76,140 inhabitants; 12,672 children between 5 and 13 years of age receiving education; pop. '91, 74,245. D. sends one member to parliament. The co. abounds in antiquities. D. formed part of Valentia in Roman times, and subsequently of the kingdom of Strathclyde.

DÜMICHEN, JOHANNES, born Silesia, 1833; studied at Berlin, and turned his attention to Egyptian archæology. He made several trips to that country, and made some remarkable discoveries concerning the temple of Denderah. He has written nearly a dozen works on Egyptian and other archæology. He d. in 1894.

DUMMER, JEREMIAH, 1680–1739; born Boston; graduated at Harvard; studied theology and spent some years in the university of Utrecht. He was in England as one of the agents of Massachusetts, and became familiar with Bolingbroke, some of whose views, it is thought, he adopted. He published a *Defence of the New England Charters*, and some less important works. His brother, WILLIAM, 1677–1761, lieutenant-governor, founded the Dummer academy at Newbury, Mass.

DUMMOW, a t. of India, in the division of Jubbulpore, Central Provinces, stands in lat. 23° 50' n., and long. 79° 30' e., being 775 m. to the westward of Calcutta. It has a large bazaar, and is abundantly provided with wells. The district in which it stands had a pop. '91, of 326,000. Pop. of town, '91, 11,800. D. is also spelt *Damoh*.

DUMONT, PIERRE ETIENNE LOUIS, an able propagator of the Benthamite philosophy, was b. at Geneva, 18th July, 1759, studied theology, and after officiating as a minister for a short time in his native town, proceeded to St. Petersburg in 1783, where he accepted the charge of the French Protestant church. In 1785, he left Russia, went to England, and became tutor to the sons of lord Shelburne, afterwards marquis of Lansdowne. His superior talents, liberal sentiments, and fine character, soon recommended him to the illustrious whigs of that period; with sir Samuel Romilly, in particular, he formed a close friendship. During the early years of the French revolution, D. was at Paris, where he became greatly attached to Mirabeau, regarding whom he has given the world much important information in his *Souvenirs sur Mirabeau et sur les deux Premières Assemblées Législatives* (which were not published till 1832, three years after the author's death). From this work, it appears that D. wrote many of the best articles and speeches attributed to Mirabeau. In 1791, D. returned to England, and formed an intimacy with Bentham. This was certainly the most important event in his life. Deeply convinced of the value of that philosopher's views of legislation, he requested his friend to allow him to arrange and edit his unpublished writings on this subject. Bentham gave him his manuscripts. D. labored earnestly to abridge, elucidate, correct, and simplify what he had received. The results appeared in his *Traité*

de *Législation Civile et Penale* (Geneva, 1802); *Théorie des Peines et des Récompenses* (Geneva, 1810); *Tactique des Assemblées Législatives* (Geneva, 1815); *Preuves Judiciaires* (Geneva, 1823); and the *Organization Judiciaire et Codification* (1828, a posthumous work). D. returned to Geneva in 1814, and became a member of the representative council. In this office he found many opportunities of putting the principles of Bentham into practice, and thus greatly benefited his native city. He died in 1829, at Milan.

DUMONT D'URVILLE, JULES SÉBASTIEN CÉSAR, 1790-1842; native of Normandy; a French navigator. He was self-taught, mastering botany, entomology, and a number of modern and ancient languages. In 1820, while on a surveying trip in the Mediterranean, he was so fortunate as to recognize in a Grecian statue just unearthed the Venus of Milo, and to secure its preservation. In later years, he was concerned in explorations around the Australian continent, New Zealand, Van Dieman's Land, and other Pacific and Indian islands. In 1830, he transported the exiled Charles X. to England. His next and most important venture was in antarctic exploration. He sailed in Sept., 1837, with two vessels. In Jan., 1838, they reached the antarctic ice, along which they coasted to the e. for 300 miles. Turning w., they visited the South Orkneys, the New Shetlands, and discovered Joinville land and Louis Philippe's land; but sickness compelled them to run to Chili. Thence they crossed the Pacific, visiting the Fiji and Pelew islands, New Guinea, and Borneo. In 1840, they returned to the antarctic region, and discovered Adélie land. In Nov., he arrived at Toulon. D'Urville was at once appointed rear-admiral. In 1842, he was killed, with his wife and son, in a railway accident. His works on natural history, and especially his collections, are valuable.

DUMOURIEZ, CHARLES FRANÇOIS, a French gen., was b. at Cambrai, 25th Jan., 1739, entered the army in 1757, and served in Germany during the seven years' war. On the conclusion of hostilities in 1763, D., who possessed a restless, adventurous genius, went from one country to another, seeking active employment. Under Louis XVI., he held the office of commandant of Cherbourg, where he commenced the formation of a great naval establishment. As the revolution drew on, D. began to attach himself more closely to the popular party. In 1790, he became connected with the Jacobin club, and during the same year was appointed military commandant of lower Normandy. After holding for a short time the office of minister of foreign affairs, he became lieut. gen. in the army of the north, commanded by Maréchal Luckner. The allies were advancing in great force. By a series of bold and rapid maneuvers, D. prevented his enemies from sweeping over the plains of Champagne, and finally took up his position at Grand-Pré. Succors quickly arrived, and the victory of Kellermann at Valmy compelled the invaders to retreat. It is generally admitted that by his admirable strategic movements at this critical period D. saved France. A winter campaign in Belgium followed, and on the 5th and 6th Nov., 1792, D. overthrew the Austrians under the duke of Sachsen-Teschen and Clairfait at Jemappes. The campaign of 1793, which aimed at the complete conquest of the Netherlands, was opened with the siege of Maestricht; Breda and other places were taken by the French; but at Neerwinde, D. sustained a severe defeat from the Austrians under Coburg. D.'s Jacobinism had been cooling for some time, on account of the anarchy prevailing at Paris, and when commissioners were sent to remonstrate with him on account of his monarchical leanings, he told them nothing could save France from the horrors of anarchy but a constitutional monarchy; D. then entered into secret negotiations with Coburg, evacuated Belgium, and promised to exert himself on behalf of the Bourbon family. He was now accused of being a traitor, by the authorities of Paris; but when requested by the commissioners to proceed to the capital, and stand his trial, he answered by handing over the representatives of the people to the Austrians. He next endeavored, but in vain, to win the army over to his plan of marching upon Paris, and re-establishing the royal authority, and D. had to take refuge, accompanied by the duc de Chartres, in the ranks of the enemies of France. The convention set a price of 300,000 francs upon his head. After wandering through many countries of Europe, he finally settled in England, where he died an exile at Turville Park, near Henley-upon-Thames, 14th Mar., 1823. Besides a multitude of pamphlets, D. wrote *Mémoires du Général Dumouriez* (Hamburg, 1796), and *La Vie et les Mémoires du Général Dumouriez* (3d edit., Paris, 1822-24).

DUMPY LEVEL, a leveling instrument for short distances. It has a short telescope with large field, and the compass is fixed underneath.

DUN, a root common to the Celtic and Gothic languages, signifying a hill or height. Besides giving rise to the Fr. *dunes*, Ger. *dünen*, Eng. *downs* (q.v.), it enters extensively into the names of places (becoming often *dum*, *don*), as *Dunkirk*, *Dumbarton*, *Donegal*. It is allied to the Ang.-Sax. *tun*, *ton*, whence *town* (q.v.).

DŮNA, DWI'NA, or DVÍ'NA, the name of a river of Russia, which rises in the government of Tver, in the neighborhood of the source of the Volga, and flows w.s.w. in a course almost parallel to that of the Dnieper. At Vitebsk, the D. turns to the w., then to the n.w., and advances in that direction toward its debouchure in the gulf of Riga,

passing the towns of Disna, Drissa, Dünaburg, Jacobstadt, and Riga. The entire length of the D. is about 650 miles. It is navigable from Dünamünde, at its mouth, to Veli, on the border of the government of Smolensk—a distance of 400 m.; but the navigation, owing to its shallows, its rock obstructions, and sand-banks, is extremely difficult and dangerous, except during the spring and autumn floods. The basin of the D. is estimated at 28,350 sq. m.; at Riga, its breadth is 2,400 feet. In the spring, the surface of the D. is covered with rafts and planks, which are floated down from the forests of the provinces through which it flows. Its waters, which abound in fish, are connected with those of the Dnieper by means of the Beresina canal, which thus connects the Black sea and the Baltic. See also DWINA, NORTHERN.

DÜNABURG, or DINABURG (official name DVINSK), a strongly fortified t. of western Russia, is situated on the Düna, in the government of Witebsk. It is of great military importance, owing to the strength of its fortifications. It has considerable trade. D. was formerly the capital of Polish Livonia. Pop. est. '93, 73,030.

DUNBAR, a royal, parliamentary, and municipal burgh, and very ancient seaport and t. in the n.e. of Haddingtonshire, on an eminence at the mouth of the firth of Forth, 29 m. e.n.e. of Edinburgh. The coast near D. consists of basaltic rocks and islets, and gives fine views of the Bass Rock, the isle of May, and Fifeshire. D. is a fine old town. It has a sailcloth and cordage manufactory, a paper mill, and extensive tile-works, breweries, etc., but the chief industry is the fisheries, in connection with which there are large curing establishments. The old harbor is impeded at the entrance by craggy islets and sunken rocks, but is accessible to vessels of 300 tons. About the year 1840, an additional harbor, called the Victoria harbor, was erected at D., at the expense of the fishery board and town; with recent important repairs and improvements, it has cost altogether upwards of £50,000. It has 4 ft. at low water, and is considered one of the best suited for fishery purposes in the country. Large quantities of herrings are annually exported from D., besides what are used for local consumption. The other exports are chiefly corn and potatoes. Pop. '91, 3,545. D. unites with North Berwick, Jedburgh, Haddington, and Lauder in sending a member to parliament. On the high rocks at the entrance to the new harbor are a few fragments of the ruins of a castle, which, from the end of the 11th c., was the chief seat of the ancient earls of March. It was once very strong, and an important security against English invasions: Edward I. took it, and Edward II. fled thither after the battle of Bannockburn; it was demolished in 1333, and rebuilt in 1336; it was successfully defended in a siege of six weeks against the earl of Salisbury by Black Agnes, countess of Dunbar, in 1338; it sheltered queen Mary and Bothwell in 1567; and in the same year it was destroyed by the regent Murray. In 1650, Cromwell, at the "Race of Dunbar," defeated the Scottish army under Leslie.

DUNBAR, WILLIAM, the greatest of the old Scottish poets, is supposed to have been born about 1460. In 1475, he went to St. Andrews, where, in 1477, he took the degree of B.A., and in 1479, that of M.A. Considerable obscurity rests upon his career for about twenty years after he left the university. From his own writings, we learn that he entered the order of St. Francis, and was employed for some time as an itinerant or preaching friar. In that capacity, he "ascended the pulpit at Dernton and Canterbury, and crossed the sea at Dover, and instructed the inhabitants of Picardy." He appears to have entered the king's service, and to have been retained as "clerk" or secretary to some of James's numerous embassies to foreign courts. In 1500, he obtained from the king a yearly pension of £10. In 1501, he visited England, in the train, as his biographers suppose, of the ambassadors sent thither to conclude the negotiations for the king's marriage. On the 9th May, 1503, three months before the queen's arrival, he composed in honor of the event his most famous poem, the *Thrissil and the Rois*. He seems now to have lived chiefly about court, writing poems, and sustaining himself with hope of preferment in the church. On the 17th Mar. 1504, he received a gift for saying mass for the first time in the royal presence. At Martinmas, 1507, his pension was doubled, and three years afterwards, it again received augmentation. He is supposed to have visited the northern parts of Scotland in May, 1511, in the train of queen Margaret. After the ruinous defeat at Flodden, and the confusion consequent on the king's death and a prolonged regency, D.'s name disappears altogether. He is supposed to have died about 1520.

As a poet, he possessed a wonderful variety of gifts; his genius comprised the excellences of many masters. He is at times as rich in fancy and color as Spenser in the *Faery Queen*; as homely, and shrewd, and coarse as Chaucer in the *Miller's Tale*; as pious and devotional as Cowper in his *Hymns*; and as wildly grotesque in satire as Burns in his *Death and Doctor Hornbook*. When Scott read portions of his works to Crabbe, in Edinburgh, the latter remarked that, "before the Ayrshire plowman, Scotland possessed at least one great poet." A complete and carefully elaborated edition of D.'s works, by Dr. David Laing, was published at Edinburgh in 1834.

DUNBLANE, a city and burgh of barony in the s. of Perthshire, picturesquely situated on the left bank of the Allan, on the Scottish Central railway, 28 m. s.w. of Perth, and 5 n. of Stirling. It takes its name from St. Blane, a bishop of the 7th or 8th c., said to have been born in Bute. It mainly consists of one street of old-fashioned

houses. Pop. '91, about 2500. The cathedral of D., chiefly in the first-pointed or early English style, about the year 1240, is now in ruins, except the choir, used as the parish church, 80 by 30 ft., with a tower 128 ft. high, the first four stages of which are Romanesque work of about the year 1140. The prebendary stalls of richly carved oak still remain. Of the bishops of D., by far the most celebrated was Robert Leighton, who held the see from 1661 till 1672, when he was translated to Glasgow. A path near the river, which he is said to have frequented, still bears the name of "The Bishop's Walk;" and the library which he bequeathed to his diocese, is still kept in the town. Two m. from D. was fought, in 1715, the indecisive battle of Sheriffmuir, between the royal forces, under the duke of Argyre, and the troops of the pretender, under the earl of Mar. D. once had an ancient Culdee monastery.

DUNCAN, ADAM, Viscount, a celebrated British admiral, was b. in 1731 at Dundee, entered the navy as midshipman in 1746, became lieut. in 1755, and in 1761, commander of the *Valiant*, of 74 guns, which took part in the expedition to Havana under admiral Keppel. In 1789, he was appointed rear-admiral of the blue, and in 1793, vice-admiral of the blue, but had little opportunity of distinguishing himself, and was even meditating, it is said, retiring altogether from the service, when he was appointed to the command of the united English and Russian squadron in the North sea, with the special design of watching the movements of the Dutch fleet—Holland and France being then both at war with England. D.'s blockade of the Texel was one of the most effective ever made, and the Dutch trade was almost ruined. During the blockade, a mutiny took place among the seamen, and D.'s position was for some time very critical, but the insubordination was ultimately quelled. Although weakened by the recall of the Russians, he gained a brilliant victory over the Dutch near Camperdown, 11th Oct., 1797, where he took the Dutch admiral, De Winter, prisoner. D. was rewarded with a pension of £2,000, and raised to the peerage, with the title of viscount. In 1799, he was promoted to the rank of Admiral of the White, and died 4th Aug., 1804, after having inherited the family estates in Perthshire, on the death of his brother.

DUNCAN, SARA JEANETTE, an American author, was born in Brantford, Ontario, Canada, in 1863, where she received her education. Her first literary work was contributions to Canadian periodicals. She made a tour of the world as newspaper correspondent. She was married in 1890 to Mr. Everard Cotes of Calcutta, India. She has published *A Social Departure* (1890), *An American Girl in London* (1891), *The Simple Adventures of a Memsahib* (1893).

DUNCAN, THOMAS, R.S.A., and A.R.A., was b. at Kinclaven, Perthshire, May 24, 1807; and died at Edinburgh, 25th May, 1845. He studied in the Trustees' academy, under sir William Allan; was his successor as head-master of that school, and one of the most distinguished members of the royal Scottish academy. His portraits, and historical and fancy subjects, evince delicate feeling for female beauty, and keen appreciation of the humorous in Scottish character. The drawing is always careful and correct, and the coloring remarkable for clearness and delicacy. Though he exhibited but few pictures in the royal academy of London, they at once attracted marked attention, and he was elected an associate of that body in 1843. The principal works he exhibited there were: "Anne Page and Slender," an illustration from the ballad of *Auld Robin Gray*, now in the Sheepshanks gallery, South Kensington; "Prince Charles's Entry into Edinburgh after the Battle of Prestonpans"—and the same prince, when a fugitive, concealed in a cave. He had now entered on a most successful career, and was engaged on the studies for two important works: "Wishart Dispensing the Sacrament on the Day of his Martyrdom;" and a large picture for the marquis of Breadalbane, "Queen Victoria at Taymouth," when he was seized with an illness which terminated fatally. One of his latest works was a portrait of himself; it is now in the national gallery of Scotland, and is an excellent specimen of careful drawing, united to great power of color and effect. That D. was remarkable for energy and industry, is proved by the number and high quality of the works he executed, though he died at the early age of thirty-eight. His portraits, especially those of ladies and children, will always hold a high place. Though constantly engaged on fancy subjects, he every year exhibited a very considerable number of portraits. In addition to the works above referred to, the following is a list of the principal historical and fancy subjects exhibited by him in the royal Scottish academy—1829: "The Death of Old Mortality," and "A Milk-girl," 1830: "The Braw Wooer," and "Children and Rabbit." 1831: "Lucy Ashton," and finished sketch of "Jeanie Deans and the Robbers." 1832: "Girl with Flowers." 1834: "Cuddie Headrig Visiting Jenny Dennison." 1835: "Mary Queen of Scots compelled to Sign her Abdication." 1836: "A Covenanter," and "Old Mortality Renewing the Inscription on a Tombstone."

DUNCANSBY HEAD (the *Berberium* of Ptolemy), a promontory forming the n.e. extremity of Caithness, in lat. 58° 39' n., and long. 3° 1' w., and one mile and a half e. of John o' Groat's house. In the vicinity are deep long chasms or *ghoos*, in the Devonian strata, and curious detached sandstone columns in the sea called *stacks*. One of the chasms is 300 yards long, 12 to 15 wide, and 100 ft. deep, and communicates with the sea by three openings, one of which is arched. The horizontal beds of the sides of the perpendicular gullies look like ruined walls.

DUNCE. See **DUNS SCOTAS.**

DUNCIAD, *THE*, by Alexander Pope, was published in 1728, in three books; and to these, in 1742, a fourth book was added. Pope had been, during the greater part of his career, afflicted by a host of critics and detractors. His own genius had not been spared; the worst motives, personal and literary, had been imputed to him; and he resolved to mete unto his enemies the measure which had been meted unto himself. Hence the origin of *The Dunciad*. Never was chastisement more complete. On its publication, a universal howl of rage and pain arose. The satire conferred immortality on his opponents. Pope was a good hater, and his hatred and contempt defy the tooth of time more completely than all the balsams of the Pharaohs.

DUNCKER, MAXIMILIAN WOLFGANG, b. Berlin, 1811; graduate and professor at Halle. He was a member of the Frankfort parliament, and of the Prussian diet. In 1861, he was counselor to the crown prince, and in 1867, director of the Prussian archives. His chief work is a *History of Antiquity*. He d. 1886.

DUNCOMBE, THOMAS SLINGSBY, an English politician, nephew of first lord Feverham, was b. 1796. He was elected M.P. for Hertford in 1824, assisted in carrying the reform bill, and became a prominent member of the extreme liberal party. In 1832, he was rejected at Hertford; but in 1834 he was returned for Finsbury, which seat he retained in the parliament which assembled in 1859. In 1842, he presented the Chartist petition, signed by 3,000,000 of the lower classes in favor of universal suffrage, vote by ballot, short parliaments, etc. In 1843, the then home secretary, sir James Graham, having sanctioned the opening of the letters of Mazzini, D. stood up in the house of commons and denounced, with bitter and scathing invective, the adoption of the post-office spy-system on English soil. He was an earnest advocate of Jewish emancipation; and his motion in 1858 for placing baron Lionel Rothschild on a committee of the house of commons, was soon followed by the concession, by the latter chamber, of the right of Jewish members to sit in the house of commons. He died Nov. 13, 1861.

DUNDALK, a parliamentary and municipal borough and seaport, the capital of the county of Louth, Ireland, is beautifully situated at the mouth of the Castleton river, 50 m. n. of Dublin. It is overlooked on the n.e. by the Carlingford mountains. Vessels drawing 16 ft. can enter the harbor. D. has manufactures of tobacco, soap, leather, starch, and salt; steam flour-mills; considerable fisheries; a distillery, brewery, and a flax-spinning mill. The chief imports, especially from Liverpool, are groceries, timber, coal, iron, slates; and the exports, flax, linen, and all sorts of agricultural and dairy products and live-stock. D. is the chief outlet for the produce of the counties of Louth, Monaghan, and Cavan. Pop. '81, 11,974, of whom 8969 were Roman Catholics, and 1803 Episcopalians. Pop. '91, 12,449. It has no parliamentary representation. It has the remains of a Franciscan friary and a Druids' circle. The last king of all Ireland was crowned here. Edward Bruce took D. in 1315, and held his court here till killed in battle at Faughart, in the vicinity, in 1318. D. was captured by the Irish in 1641, by Cromwell in 1649, and by Schomberg in 1689. **DUNDALK BAY** is 8 m. long by 7 broad, and with 4 to 6 fathoms of water in the middle. It receives the Fane, Dee, and Castleton rivers.

DUNDAS. 1. A castle and manor on the s. bank of the firth of Forth, near South Queensferry; the castle is a square tower of the 15th c., with modern additions; the manor was the original seat of the distinguished family of D., to whose progenitor it was granted by the earl of March about the year 1150.—2. A town in the province of Ontario, Dominion of Canada, at the head of Burlington bay, at the w. of lake Ontario. Pop. '91, 3546. It is a station on the Great Western railway, and has a number of mills and manufactories.—3. An island, belonging to Great Britain, situated on the n.w. coast of America, 40 m. n.e. of Queen Charlotte island. It has Dixon's Entrance (q.v.) on the w., and is separated by Chatham sound from the most southerly of the Alaskan islands.—4. A group of nearly 500 islets, all of coralline formation, lying off the e. coast of Africa, being about lat. 1° south. There is only one secure harbor.—5. A river flowing into Delagoa bay (q.v.).—6. A strait in North Australia, separating Melville island from Coburg peninsula, being 18 m. in breadth.

DUNDAS, a co. in Ontario, Canada, on the St. Lawrence, intersected by the Grand Trunk railroad; pop. '81, 20,598; '91, 20,132. Chief town, Cornwall.

DUNDAS (of Arniston), the name of a Scottish family singularly distinguished for legal and political talent. Sir James D., the first of Arniston, received the honor of knighthood from James VI., and was governor of Berwick. His son, sir James D., was appointed a judge of the court of session in 1662, and took his seat on the bench under the title of lord Arniston, but was soon after deprived of his office for refusing to abjure the "National and Solemn League and Covenant." He died in 1679. His eldest son, sir Robert D., who also rose to the bench, died in 1727. **DUNDAS, ROBERT**, the son of the preceding, was born 9th Dec., 1685; became a member of the faculty of advocates in 1709; and in 1717 was appointed solicitor-general for Scotland, an office which he filled with great ability in a period of much political confusion. In 1720 he was made lord advocate; and in 1722 was chosen to represent the county of Edinburgh in the British parliament, where he honorably distinguished himself by his attention to

Scottish affairs. When sir Robert Walpole came into power in 1725, D. resigned his office, when he was elected dean of the faculty of advocates. In 1737, he was raised to the bench, when, like his father and grandfather, he took the title of lord Arniston. On the death of lord president Forbes of Culloden, in 1748, he was appointed his successor. He died in 1753. As an advocate, D. was a powerful and ingenious reasoner, and though somewhat disliked on the bench, his ability was universally admitted.—DUNDAS, ROBERT, the eldest son of the preceding, was born 18th July, 1713, studied at Edinburgh and Utrecht, was admitted to the Scottish bar in 1738, and rose to be lord advocate (1754), and president of the court of session (1760). D. died at Edinburgh, 13th Dec., 1787.

DUNDAS, the Right Honorable HENRY, Viscount MELVILLE, and Baron DUNIRA, brother of the preceding, was b. in 1742, and educated at the university of Edinburgh. He was admitted a member of the Scottish bar in 1763. As a younger son of a pretty numerous family, his circumstances were rather straightened; but his assiduity, his large share of the family talent, and no doubt of the family influence, soon procured him advancement in his profession. He was successively appointed deputy-advocate and solicitor-general. In 1774, he was returned to parliament for the county of Edinburgh, and in the following year was appointed lord-advocate for Scotland. Two years after, he was made keeper of the king's signet for Scotland. D.'s career in parliament was highly successful, though not very creditable to his political consistency. Elected in opposition to ministerial influence, he soon allied himself with the party in power, and became a strenuous supporter of lord North's administration, being one of the most obstinate defenders of the war with the American colonists. When lord North resigned in 1781, D. continued to hold the office of lord advocate under the Rockingham ministry. On the question of the war with America, D. had been opposed to Pitt; but when the coalition ministry was formed by Fox and lord North, he passed over to the side of his old opponent, and became Pitt's ablest coadjutor. When Pitt returned to the helm of the state in 1784, D. was appointed president of the board of control. In 1784 he introduced a bill for restoring the estates in Scotland forfeited on account of the rebellion of 1745. In 1791, he was appointed principal secretary of state for the home department. He also held a great number of other offices, one of which, the treasurership of the navy, involved him some years after in much trouble. D.'s aptitude for business was undeniable. Many of the most important public measures originated with, or were directly promoted by him. Among such were the formation of the fencible regiments, the supplementary militia, the volunteer corps, and the provisional cavalry; in short, the whole of that domestic military force raised during the war consequent on the French revolution. When Pitt resigned in 1801, D. did the same. In 1802, under the administration of Mr. Addington, he was elevated to the peerage by the titles of viscount Melville and baron Dunira. In 1805, his lordship was accused of "gross malversation and breach of duty," while acting as treasurer of the navy. The trial commenced 29th April, 1806; but in spite of the splendid array of whig talent against him, D. was acquitted on all the charges. After this, however, he took little part in public affairs, spending the most of his time in retirement in Scotland. He died at Edinburgh, 28th May, 1811.

DUNDEE (Lat. *Taodunum*, the "hill or fort on the Tay") a royal parliamentary and municipal burgh and seaport, in the s. of Forfarshire, on the left bank of the estuary of the Tay, here two m. broad, 10 m. from the entrance of that river into the sea, 50 m. n.e. of Edinburgh, 20 e.n.e. of Perth, and 14 s.e. of Forfar. In population, it is the third town in Scotland. It stands mostly on the slope between Dundee law (525 ft. high, composed of trap, and with traces of ancient vitrification) and Balgay hill and the Tay. The new streets are wide and well laid out. The most striking architectural features of the town are—the town hall, in the Roman Ionic style, with a spire 140 ft. high, erected by the "elder Adams," in 1734; the Albert institute including a free library, picture galleries, museum, etc., in 15th c. Gothic, from designs by sir Gilbert Scott; the royal exchange, built in the Flemish pointed style of the 15th c., and opened in 1856; the eastern club house; the corn exchange; the infirmary; the judiciary and sheriff-court buildings; the post-office; the high school; the town's churches, with the old tower, 156 ft. high, restored in 1873, under the charge of sir Gilbert Scott, at a cost of £7,000; St. Paul's Episcopal church, with a tower and spire 217 ft. high; St. Paul's free church, with a tower and spire 167 ft. high; and St. Enoch's free church, with two handsome towers; the Morgan hospital (opened 1868), erected and endowed, under the will of John Morgan, a native of Dundee, for the maintenance and education of 100 boys; a new orphan asylum, University College founded in 1882 and affiliated with St. Andrews University, Kinnaird Hall and a technical institute. D. has several public parks, one of which, the Baxter park, on a beautiful slope to the eastward of the town, is 37 acres in extent, and was presented by sir David Baxter; another, to the westward of the town occupies the hill of Balgay, and is finely wooded and beautifully laid out, its extent being about 36 acres. Besides these are Lochee Park, acquired in 1891 and having 25 acres; Dudhope Park (1893), with 24 acres; The Law, and the old common called the Magdalen Green. D. is the chief seat in Great Britain of the manufacture of coarse linen fabrics (osnaburgs, sheetings, ducks, dowlas, drills, canvas, and cordage). Manufactures of jute are very extensively carried on here. Till 1830 the material of its

manufactures was flax imported from Russia, but jute was at that time introduced and now constitutes the raw material of the chief manufacturing industry in D. Of jute many varieties of fabric are made, from the coarsest nail-bagging to carpets of great beauty. This range includes packages for every species of merchandise, sacks for wool, coffee, guano, etc. Between 1870 and 1890 the imports of jute from D. increased from 81,740 to 226,111 tons. D. is also famous for its manufacture of confectionery and marmalade. D. is the center of the whale and seal fishing trade of Great Britain. Shipbuilding (both wood and iron) and machine-making are carried on to some extent. D. has magnificent harbors in addition to the tide harbor, several large wet docks, two graving-docks and a jetty for vessels drawing more than 24 feet of water. At the n. end of the mid quay stands the royal arch in commemoration of her majesty's landing here in 1844. D. is well supplied with water. At the entrance of the firth one of the largest iron bridges ever constructed has been built across the Tay. It was opened in 1887, and is more than two miles long. Pop. '96, 161,620. D. sends two members to parliament. It was an important place in the 12th century. Edward I. was here in 1296 and 1303. Wallace is said to have taken the castle in 1297, and Bruce demolished it in 1313. The duke of Lancaster burned D. in 1385, and the marquis of Montrose pillaged it in 1645. The active part taken by its inhabitants in the Reformation won for the town the title of the "Scottish Geneva." Charles II. lived here, after his coronation at Scone, in 1650. On the refusal of D. to submit to Cromwell, gen. Monk, 1651, sacked and burned it, massacring 1000 citizens and soldiers, and filling 60 vessels with booty, which were totally wrecked on their voyage to England. D. was one of the first Scotch towns to adopt the Reformation. Wishart the martyr preached here during the plague of 1544.

DUNDEE, VISCOUNT. See GRAHAM, JOHN.

DUNDONALD, THOMAS COCHRANE, Earl of, son of the ninth earl of Dundonald, was b. Dec. 14, 1775. He, while still a boy, entered the 104th regiment. At the age of 17, he joined the *Hind* corvette, commanded by his uncle, capt. sir Alexander Cochrane. In 1800, he became master and commander of the *Speedy* sloop-of-war, of 14 guns and 54 men; and in 10 months he took 33 vessels, carrying together 128 guns and 533 men, besides assisting in the capture of many others. D. received his post-rank, 1801, for the capture, by boarding, of *El Gamo*, a Spanish frigate of 32 guns, off Barcelona. In 1803, he was appointed to the *Arab*, 22, and served at the blockade of Boulogne. In 1804, he removed to the *Pallas* frigate, 32, and was sent out to assist his uncle, then employed in the blockade of Ferrol. He made several valuable prizes while cruising off the Spanish coast, among others the *Fortuna*, with specie to the amount of £150,000, besides merchandise, but generously returned 10,000 crowns to the Spanish capt. and supercargo. In 1806, he cut out the *Tapaguese* corvette, which lay in the Gironde, under the protection of two heavy batteries. He destroyed the semaphores along the French coast, and carried by storm the battery at Pointe l'Equilon, which he blew up. Being now transferred to *L'Impérieuse*, he took and destroyed, in the month ending Jan. 7, 1807, 15 of the enemy's ships, chiefly laden with wine and provisions. He was next sent to co-operate with the patriots on the coast of Catalonia, and contributed to the surrender of the castle of Mongat. After harassing the French coast, and destroying the semaphores on the coast of Languedoc, he volunteered for the defense of fort Trinidad, at Rosas, on the coast of Catalonia. At the head of 80 of his own men, and the same number of Spaniards, he repelled 1000 of the enemy in an assault made by them upon the castle. He protracted the siege for 12 days, then blew up the magazine, and returned to his ship. In April, 1809, he was selected by the admiralty for the daring and hazardous service of burning the French fleet then lying at anchor, and blockaded by lord Gambier, in the Basque roads. At night he went on board one of the fireships, containing 1500 barrels of gunpowder, and performed the service intrusted to him with characteristic intrepidity. He was rewarded with the knighthood of the bath. He had been chosen M.P. for Westminster in 1807, and his charges of incompetency against lord Gambier led to a court-martial upon that nobleman. Lord Gambier, after a partial trial, was acquitted, and the professional prospects of his assailant were ruined. During the rest of the war, the country lost the incalculable benefit of his services at sea, the navy gaining, on the other hand, such small advantage as could in those days be derived from D.'s protest in parliament against naval abuses. Early in 1814, he was accused of complicity in fraudulent stock-jobbing transactions. A rumor of the downfall of Napoleon having caused a sudden rise in the funds, D. and his friends were charged with having fraudulently propagated the rumor, and with having "sold out" to a large amount. He was found guilty of fraud, and was sentenced to pay a fine of £1000, to suffer a year's imprisonment, and to stand in the pillory. The latter part of the punishment was remitted, but he was deprived of the Order of the Bath, of his rank in the navy, and expelled from the house of commons. A new writ was issued for Westminster; but his constituents immediately re-elected him, notwithstanding his expulsion from the house; and his daring was shown by his escape from prison, and his re-appearance in the house. He represented Westminster until 1818, when, panting for a more active and eventful career, he drew his sword in defense of the independence of the South American colonies of Spain. The command of the fleet of the republic of Chili

was offered to him, and the terror of his name materially contributed to the success of the national cause. Valdivia, the last stronghold of the Spaniards, was captured by him. Another daring exploit was the cutting out of a large 40-gun frigate from under the guns of the castle of Callao, 5th Nov., 1820. The emperor of Brazil, Dom Pedro, afterwards gave him the command of the Brazilian fleet, and created him a marquis. In 1827 and 1828, he assisted in the Greek war of independence. In 1830, the whig administration of earl Grey came into office, and, believing him to have been the victim of a cruel and unjust persecution, hastened to restore him to his naval rank. In 1831, he succeeded to the earldom. In 1847, queen Victoria conferred on him the grand cross of the bath. He was also appointed commander-in-chief on the North American and West India station. In 1851, he was vice-admiral of the white, and in 1854, rear-admiral of the United Kingdom, a distinction which he held until his death. On his retirement from active service, he devoted himself to scientific inventions. He made improvements in poop and signal lights, and especially turned his attention to naval projectiles. He declared himself to be in possession of a means of annihilating an enemy's fleet, and during the Russian war offered to destroy Sebastopol in a few hours with perfect security to the assailants. His plans were, however, rejected. When upwards of 80 years of age, he published his autobiography—the record of a career almost unequaled even by British seamen for desperate service and dauntless exploit. He died Oct. 31, 1860, and was interred in Westminster abbey. In his naval expeditions, it was his fate to be constantly opposed to forces greatly superior to his own in numbers and metal. His inventiveness and fertility of resource under such circumstances have perhaps never been equaled. His daring would have been, in a man of less genius, the height of rashness, yet the almost unvarying success of his maneuvers and exploits attests his forethought, and his happy adaptation of slender means to the achievement of great ends and noble enterprises. In person, he was tall and broad built; and a slight stoop, contracted by service in the small sloops and corvettes of his early days, scarcely impaired a height of stature that might be described as commanding. His features were Scottish in character, and strongly marked, bearing in deep lines the traces of struggle, sorrow, and the wear and tear of an unusually long, active, and eventful life.—In 1877, a petition was presented to the queen, asking compensation to D.'s heirs for his 18 years' loss of pay and allowances as a naval officer—a petition which was ultimately granted.

DUNDROM BAY, an inlet of the Irish sea, on the e. coast of Ireland, in the co. of Down, 5 m. to the s. of Downpatrick, is about 10 m. wide at its entrance, and forms a long curve into the shore, with a uniform breadth of about $2\frac{1}{2}$ miles.

DUNDY, a co. in Neb.; formed 1873; intersected by the Burlington Route railroad. Area, 912 sq. m. Pop. '90, 4012. Co. seat, Benkelman.

DUNE'DIN, the capital of the province of Otago, in New Zealand, is situated in lat. $45^{\circ} 50'$ s., long. $170^{\circ} 36'$ e., on the e. side of South island, towards its southern extremity. It is 200 m. by sea from Lyttleton, and 150 m. from Invercargill. It lies on the s. w. side of a bay. Entrance to the wharves is afforded to vessels drawing 19 feet of water by means of Victoria channel. Since its foundation by the New Zealand company, in 1848, the city has rapidly increased in importance; chiefly after the year 1861, when the discovery of extensive gold-fields in the neighborhood caused a sudden increase of population. For 3 years, the city, as well as the province, made great strides in wealth and prosperity; though subsequently the excessive increase of population was checked by a decrease in the yield of gold. The population of the city proper was in 1886, 24,243, a decrease of 38 since 1881; in 1896 the population was 22,815, with suburbs 47,280. D. is divided into four wards. It is as well laid out as the hilly nature of its site will allow, and is well paved and lighted. Encircling the city is a reserve called the Town Belt. There are many handsome buildings, including many churches. D. is the seat of an Anglican and a Roman Catholic bishop. Other public buildings are the post-office, hospital, government buildings, mechanics' institute, etc.; and the inhabitants of the city possess places of recreation in the Vauxhall gardens, botanical gardens, the grounds of the acclimatization society, and Jubilee Park, opened in 1887. It is the seat of the University of Otago and of a museum and art gallery. Steamers sail regularly between D. and Melbourne; and railways have been constructed both to the n. and s., already extending to Invercargill, 110 m. to the south-west. Several daily and weekly newspapers are published. The principal articles of export are grain, potatoes and wool—the last being by far the most important. The rapid extension of the wool traffic has been marvelous.

DUNES, from the same root as dun (q.v.), a hill, the name given to the sand-hills or mounds which stretch less or more along the sea-coast of the Netherlands and n. of France. These D. are a natural curiosity. "As if anxious to save the low countries from tidal inundation, nature has for centuries been energetically working to increase the magnitude of the mounds on the coast. At low-water, when the beach is exposed to the action of the winds from the German ocean, clouds of sand are raised into the air, and showered down upon the country for at least a mile inland; and this constantly going on, the result is, that along the whole line, from Haarlem to about Dunkirk or

Calais, the coast consists of sandy mounds of great breadth, partially covered with grass and heath, but unfit for pasturage or any other purpose, and these are the bulwarks which protect the coast. In some places, these D. look like a series of irregular hills; and when seen from the tops of the steeples, they are so huge as to shut out the view of the sea. The traveler, in visiting them from the fertile plains, all at once ascends into a region of desert barrenness. He walks on and on for miles in a wilderness such as might be expected to be seen in Africa, and at last emerges on the sea-shore, where the mode of creation of this singular kind of territory is at once conspicuous. Loose particles of sand are blown in his face; and as he descends to the shore, he sinks to the ankle in the drifted heaps. In some parts of these dreary solitudes, the sandy soil has been prevented from rising with the wind and injuring the fertile country, by being sown with the seeds of a kind of bent-grass, and in a few spots fir-trees have been successfully planted."—*Tour in Holland*, by W. Chambers. The English term *downs* (q. v.) has a similar meaning.

DUNFERMLINE, a royal burgh in Fife, of the western district of which it is the chief town. It is the seat of the sheriff courts of the district, which are held twice a week during the session. The town is situated on a long swelling ridge, 3 m. from the firth of Forth, and 16 m. w.n.w. from Edinburgh. It stands 300 ft. above the mean level of the firth, and from the s. has an imposing appearance. The date of its origin is not known, but it was a place of note before the end of the 11th century. Here, king Malcolm Canmore and his queen, St. Margaret, between the years 1070 and 1093, founded an abbey for Benedictines brought from Canterbury. In 1303-4, Edward I. of England wintered here, the buildings being then described as capable of accommodating three kings and their suites. In 1588, D. was created a royal burgh by James VI. David II., James I. of Scotland, and Charles I., were born here; and Malcolm Canmore, his queen Margaret, Edgar, Alexander I., David I., Malcolm the maiden, Alexander III., Robert Bruce, his queen Elizabeth, and nephew Randolph, Annabella, queen of Robert III., Robert, duke of Albany, governor of Scotland, were buried in the abbey and its precincts. The tomb of Robert the Bruce was discovered at the building of the new church, which was opened in 1821. The skeleton of the king was disinterred, and a cast was taken of the cranium. Some interesting fragments of the ancient regal and ecclesiastical magnificence of D. still remain. What is called Malcolm Canmore's tower is a mass of shapeless ruins, but the s. wall of the palace of the Stuarts still exists, overhanging the romantic glen of Pittencrief, a noble wreck, with massive flying buttresses. Of the abbey, the frater hall or refectory, and a tower and arched gateway, still remain. The nave of the abbey church, consecrated in 1150, is in the Romanesque style, 106 ft. long, and 55 wide. The choir, built about 1250, a fine example of the first pointed style, was taken down in 1818-21, when it was replaced by what is now the parish church, surmounted by a square tower 100 ft. high, round which is the inscription, in open hewn capital letters, "King Robert the Bruce." Among the other buildings are the Carnegie library, Carnegie baths, St. Margaret's Hall, the Abbey church, high school and corporation buildings. The modern history of D. is chiefly remarkable in connection with the rise of Scottish dissent, Ralph Erskine and Thomas Gillespie having respectively been founders of the Seceder and Relief bodies, now joined under the name of United Presbyterians. The staple trade of the town is damask linen-weaving, which took its rise about the beginning of the eighteenth century. There are establishments for the spinning of linen yarn, and several large factories where steam and hand loom weaving is carried on. There are likewise large collieries and lime-works, iron foundries, breweries, dye-works, and fire-clay works. See **DAMASK**. The public buildings are town-house and county buildings, each having a spire, and the prison, poor-house, and music hall. Pop. of parish, '71, 23,313, of which the town contained 14,963. Pop. of borough, '81, 17,085; '91, 19,647.

DUNFISH, codfish cured so that they have a dark or dun color. They are split and partially salted, piled away in a dark place, covered with eel-grass, and pressed. The process gives them a peculiar flavor.

DUNGANNON, a municipal borough in the east of Tyrone, near a tributary of the Blackwater, 11 m. n.n.w. of Armagh, and 8 m. w. of lough Neagh. It lies on a hill-slope, in a densely peopled district, with high mountains to the west.. It is well built, and consists of a square with diverging streets. In the vicinity are the largest lime-quarries and collieries in Ulster. The chief manufactures are linen, coarse earthenware, and fire-brick. Pop. '91 about 4000. Till 1885 it was a parliamentary borough, sending one member to parliament. It was the chief seat of the O'Neils, the kings of Ulster, till 1607. Its castle was destroyed by the parliamentary forces in 1641.

DUNGARVAN, a municipal borough, seaport, and bathing-place, Waterford co., Ireland, 25 m. w.s.w. of Waterford. Until 1885 it was also a parliamentary borough. The pop. in '81 was 7,377, chiefly engaged in hake, cod, herring, and other fisheries; pop. in '91, 5263. The chief exports are grain, butter, cattle, and fish. D. has the remains of an Augustinian abbey founded in the 7th c. by St. Garvan. It has, besides, the remains of walls built by king John, who also built the castle, now used as barracks. — Dungarvan bay is 3 m. wide, about the same in length, and 1 to 5 fathoms deep.

DUNG BEETLE, the common name of many coleopterous insects of the tribe *scarabæides*, which feed upon the dung of animals, and for the most part live in it. They are found in all parts of the world. Many of them belong to the section of *scarabæides* called *coprophagi* (Gr. dung-eaters); but others, as the **DOR**, or **SHARD-BORN BEETLE** (*geotrupes stereorarius*), to the section called *arenicoli* (Lat. sand-dwelling), distinguished by peculiarities in the antennæ, mandibles, etc. Neither section, however, consists exclusively of insects entitled from their habits to be called dung beetles, some of the *coprophagi* feeding chiefly on marine vegetables in a state of putrescence, and some of the *arenicoli* on the roots of plants. The **DOR** is one of the most common British beetles; it is of a stout form, less than an inch long; black, with brilliant metallic and blue reflections on the under surface; it may often be heard droning through the air towards the close of the summer twilight, and finds its way with rapidity and certainty to cow-dung, on which it feeds, and under which it burrows, making a large cylindrical hole, often of considerable depth, and depositing therein its eggs, enveloped in a mass of dung. These habits—more or less modified—are shared by many other species, which thus not only hasten the removal of what would otherwise become offensive on the surface of the ground, but even distribute it in the soil, where it affords nourishment to plants.—The sacred beetle or scarabæus (q.v.) of the Egyptians (*scarabæus sacer*, or *ateuchus sacer* of modern entomologists) is a true **D. B.**, one of the *coprophagi*, in size and color much resembling the dor. It is found not only in Egypt, but in the s. of Europe and w. of Asia, and deposits its eggs in dung, which it rolls into little balls for the purpose. A nearly allied insect (*gymnopleurus pilularius*), a native of North America, is known as the **TUMBLE-DUNG BEETLE**, from its habit of rolling globular pellets of dung to the place where they are to be buried in the earth. Several individuals sometimes combine their strength in this curious operation, which is performed by the hind-feet pushing backwards.—The dor, and some other dung beetles, simulate death to deceive their enemies when they apprehend danger, not, like many insects, by contracting their bodies as much as possible, and drawing in their legs, but by stretching every part out to the utmost, and rigidly fixing themselves in that position. See *illus.*, **BETLES**, ETC., vol. II.

DUNGEON. See **DONJON**.

DUNGNESS is the name of a headland in England, projecting into the English channel, and forming the southern extremity of Kent. It is situated some ten miles south-east of Rye, and has a fort and a light-house.

DUNGLISON, **ROBLEY**, LL.D., 1798-1869; b. England, educated in Germany, and called to the chair of medicine in the university of Virginia; afterwards professor in the university of Maryland, and in the Philadelphia medical college. He was a diligent student, and enjoyed a high reputation for benevolence. He was the author of a large number of excellent medical books, among which are a *Medical Dictionary* and *Therapeutics and Materia Medica*. The dictionary is a standard work of its class.

DUNKELD, a small village in the e. of Perthshire, 15 m. n.n.w. of Perth. It lies in a deep romantic hollow, on the great e. pass (of Birnam) to the Highlands, on the left bank of the Tay, across which it communicates with the s. by a handsome bridge, built in 1809 by the duke of Athole. It is environed by dark-wooded and craggy mountains. D. is a place of great antiquity, dating probably from the 7th or 8th century. About the year 1130, king David I. made it the seat of a bishopric, of which the Culdees of the ancient abbey were the chapter. The choir of the cathedral, chiefly in the first pointed style, was built between 1318 and 1337; the nave, in the second pointed style, was built between 1406 and 1464; and the tower and chapter-house, also in the second pointed style, were built between 1470 and 1477. The choir is now the parish church. The nave, which is in ruins, contains one or two ancient monuments.

DUNKERS, or **TUNKERS**. See **BAPTISTS**, **GERMAN**.

DUNKIN, **CHRISTOPHER**, was born in 1811, educated at the universities of Glasgow and London. Coming to the United States, he taught Greek for a time at Harvard, but soon moved to Canada. There he edited the *Montreal Chronicle*, and entered law and politics, becoming assistant secretary for Lower Canada in 1847, minister of agriculture in 1869, and puisne judge in 1871. He died 1880.

DUNKIRK, city and port of entry, in Chautauqua co., N. Y., on lake Erie, reached by the Lake Shore and Michigan Southern and other railroads; 40 m. s.w. of Buffalo. It has a good harbor, and a large lake trade by steam and sailing vessels. In the city are an opera house, numerous churches, an orphan asylum, a monastery, a public hall, Holly system of waterworks, electric street railroads, the extensive repair-shops of the Erie railroad, locomotive works, iron works, and other factories. There is direct communication with the coal, iron, and oil regions of Pennsylvania. Pop. '90, 9416.

DUNKIRK, or **DUNKERQUE**, the most northerly seaport and fortified t. of France, stands on the eastern shore of the strait of Dover, in the department of Nord, its distance from Paris being in a direct line about 155 m. n., and from Lille about 43 m. n.w. The town, which is connected by railway and canal with the principal manufacturing centers of Belgium and France, is surrounded by ramparts and ditches, and is defended

by a citadel. It is well built, the streets spacious and well paved, the houses chiefly of brick. Its quay and pier, its church of St. Eloi—a Gothic structure, having a handsome though rather incongruous frontispiece in its Corinthian portico—its town-hall, barracks, college, and theater, are the principal architectural features. The harbor of D. is shallow, and the entrance difficult, but the roadstead is large and safe. D. has manufactures of soap, starch, beer, beet-root sugar, cordage, and leather; also metal foundries, distilleries, salt refineries, and ship-building yards. Forming as it does the outlet for the great manufacturing department of Nord, its trade by sea is very considerable. Since becoming a free port, it has also carried on a good trade in wine and liquors. Its cod and herring fisheries are actively prosecuted. The immediate vicinity of D. has a dreary and uninteresting appearance. Pop. '86, 38,004; '91, 39,498; '96, 39,718.

D. is a place of considerable historic interest. It owes its origin, it is said, to the church built by St. Eloi in the 7th c., in the midst of a waste of sand-hills or dunes, and hence its name, "Church of the Dunes." D. was burned by the English in 1388, taken by them under Oliver Cromwell in 1658, but sold to Louis XIV. by Charles II. for a sum of money in 1662. By the treaty of Utrecht in 1715, the French were compelled to destroy the fortifications of D., which were again restored, however, in 1783. In 1793, the allies under the duke of York laid siege to D., but were compelled by the French to retire, after having suffered severely. D. was made a free port in 1826.

DUNKLIN, a co. in s.e. Missouri, on the Arkansas border; 500 sq.m.; pop. '90, 15,085, with colored. The surface is mostly prairie and swamp, with moderate fertility. Agriculture is the chief business. Co. seat, Kennett.

DUNLAP, WILLIAM, 1766–1839; b. N. J.; a painter and author. His early life was devoted to painting, interspersed with literary and theatrical work. He wrote a number of plays, and published a *History of the American Theater*; *Arts of Design in the United States*; and a *History of the New Netherlands*. He was one of the founders of the New York academy of design.

DUNLIN, or **PURRE** (*tringa alpina*, *T. cinclus*, or *T. variabilis*), a bird of the family *scelopacidae* (snipes, etc.), and of the large group to which the names sandpiper and stint are variously given. It is not quite 9 in. in length from the extremity of the bill to that of the tail. The plumage undergoes great variations in summer and winter. It is a very widely diffused bird, being found both in Europe and America.

DUNLOP, GEORGE KELLY, D.D., b. 1830; ordained priest in the Prot. Epis. church, 1856; was rector of Grace church, Kirkwood, Mo.; prof. of Latin and Greek at the Masonic coll., Lexington, Mo.; was consecrated missionary bp. of N. Mex. and Arizona, 1880; died March, 1888.

DUNMORE, a borough in Penn., Lackawanna co., near Scranton; pop. '90, 8315. Coal mining is the chief business.

DUNMOW FLITCH or **BACON**, a prize instituted at Dunmow, in Essex, in 1244, by Robert de Fitzwalter, on the following conditions: "That whatever married couple will go to the priory, and kneeling on two sharp-pointed stones, will swear that they have not quarreled nor repented of their marriage within a year and a day after its celebration, shall receive a flitch of bacon." The prize was first claimed in 1445, two hundred years after it had been instituted. After 1751, up to which date only five presentations had taken place, the flitch was not again claimed till 1855. The tenth occasion of awarding the flitch occurred in 1876.

DUNN, a co. in n. western N. Dakota, formed 1883 from part of Howard; 1152 sq.m.; pop. '90, 159. It is watered by the Little Missouri and Big Knife rivers.

DUNN, a co. in n.w. Wisconsin on Chippewa and Red Cedar rivers; 860 sq.m.; pop. '90, 22,664. Productions, grain, hay, butter, etc. Co. seat, Menomonie.

DUNNAGE, on shipboard, is a name applied to miscellaneous fagots, boughs, bamboos, old mats or sails, and loose wood of any kind, laid in the bottom of the hold to rest the cargo upon; either to keep the ship in trim or to preserve the cargo from damage by leakage.

DUNNELL, MARK H., b. Me., 1823; graduated from Waterville coll., 1849; was a member of the Me. legislature and senate; and for a number of years was state supt. of common schools. He served as a col. in the civil war; was U. S. consul at Vera Cruz, Mexico; was a member of the Minn. legislature, 1867. He was elected as a republican from Minn. to the XLII and five succeeding congresses and to the LIst.

DUNNET HEAD, a rocky peninsula, 100 to 600 ft. high, the most northerly point of Scotland, on the n. coast of Caithness, in lat. 58° 40' n., and long. 3° 21' west. It consists of upper old red sandstone, resting on the middle flagstone of the same system.

DUNNING, JOHN, Lord **ASHBURTON**, 1731–83; an English lawyer. His fame began in 1762 with his *Defense of the United Company of Merchants of England trading to the East Indies*, and their Servants, particularly those at Bengal, against the *Complaints of the Dutch East India Company to his Majesty on the Subject*. In 1763, he further distinguished himself in the defense of John Wilkes, whose cause he conducted throughout. In 1766, he was chosen recorder of Bristol, and the next year was appointed solicitor-general. After 1771, he was in the opposition, making many powerful speeches in parliament. In

1782, he was appointed chancellor of the duchy of Lancaster, and about the same time was raised to the peerage.

DUNNOCK. See HEDGE-SPARROW.

DUNNOTTAR CASTLE, the ancient seat, now in ruins, of the Keiths, the earls marischal of Scotland, on the Kincardineshire coast, a mile and a half s. of Stonehaven. It occupies the top of a rock 3 acres in extent, and 160 ft. high, overhanging the sea, with a deep though dry chasm between it and the mainland, and it is approached by a steep winding path. In 1296, Wallace is said to have taken the rock and the kirk of Dunnottar from the English. During the commonwealth, the regalia of Scotland were hid in the castle from the republican army, and before the garrison surrendered to Cromwell's troops in 1651, the regalia were removed and secreted in the church of Kinneff, by Mrs. Grainger, the minister's wife. In the times of James II. and Charles II., D. C. was one of the state prisons, where the Covenanters were confined. It was dismantled after the rebellion of 1715, on the attainder of the last earl marischal.

DUNOIS, JEAN, called the Bastard of Orleans, count of Dunois and Longueville, one of the most brilliant soldiers that France ever produced, was b. in Paris in 1402. He was the natural son of Louis duke of Orleans, brother of Charles VI., and was brought up in the house of that prince along with his legitimate children. D. is said to have been intended for the church, but this is doubted. His first important military achievement was the overthrow of the English at Montargis (1427). He next threw himself into Orleans with a small body of men, and bravely defended the place till the arrival of the famous Joan of Arc, whose religious enthusiasm combined with the valor of the bastard raised the drooping spirits of the French, and the English were obliged to raise the siege. This was the turning-point in the fortunes of the French nation. In 1429, D. and the maid of Orleans won the battle of Patay, after which he marched, with a small body of men, through the provinces then overrun by the English, and took the fortified towns. The capture and death of Joan of Arc arrested for a moment the progress of the French arms, but the heroism of D. was irresistible. He took Chartres, the key of Paris, forced Bedford to raise the siege of Lagny, chased the enemy from Paris, and within a very short period deprived them of all their French conquests except Normandy and Guienne. The next grand series of successes on the part of D. was the expulsion of the English from Normandy. Town after town yielded—Rouen, Harfleur, Honfleur, Caen, Falaise, Cherbourg. This splendid campaign lasted only a year and six days. Not less triumphant was his career immediately after in Guienne; Montguyon, Blaye, Fronsac, Bordeaux, and lastly Bayonne, fell into his hands. The English, in fact, were swept out of the country, and the freedom of France from all external pressure permanently secured. Louis XI., on his accession to the throne in 1462, dispatched D. as governor to Genoa, which had yielded itself to France, but soon after, in a fit of jealousy and suspicion, deprived him of all his offices. D. now placed himself at the head of the alliance *Pour le Bien Public*, and by the treaty of Confians, 1465, recovered all his confiscated estates. He died 24th of Nov., 1468. There is no name so popular in France as that of D.; there is no hero so national; he labored 25 years for the deliverance of his country, and this *alone*—his sword was never unsheathed, except against the English. He never had a force under him which could enable him to win a victory that might balance Agincourt or Crécy, but the multitude and constancy of his petty successes served the cause of France more effectively than great and sanguinary contests would have done.

DUNOON, one of the most frequented sea-bathing places and summer residences in the w. of Scotland, is situated in the s.e. of Argyshire, on the w. side of the firth of Clyde, 9 m. w. of Greenock. A village existed here from a very early date, but a new well-built town, with fine villas around, has of late years sprung up. The pop. of D. in 1891 was 5285. Dunoon castle, of which only a small part now remains, stood on a conical hill near the pier, and was once a royal palace and strong fortress. The Argyle family once lived here, but the building became a ruin about 1700.

DUNS, a burgh of barony in the Merse, in the middle of Berwickshire, the largest t. in the co., on an eminence on the Whitadder, 44 m. s.e. of Edinburgh, and 13 w. of Berwick-on-Tweed. Pop. '91, 2198. To the n. of the town is Duns Law, 630 ft. high.

DUNSINNANE, one of the Sidlaw hills, in the e. of Perthshire, 1114 ft. high, 7 m. n.e. of Perth, and looking towards Birnam hill (q.v.). On the top are the remains of the rampart and fosse of an ancient fortification, popularly called Macbeth's castle.

DUNS SCOTUS, one of the most famous and influential of the scholastics of the 14th century. His history is involved in considerable obscurity. England, Scotland, and Ireland all contend for the honor of having given him birth, but without anything to offer in support of their respective claims beyond inference from his name. As to the date of his birth, all that can be said is, that it was in the last half of the 13th century. Whatever was the history of his youth, he entered early the order of Franciscans, studied at Oxford, and soon became professor of theology. His prelections were attended by crowds of auditors, the number of students at Oxford then exceeding 30,000. About 1304, he removed to Paris, then the chief seat of scholastic philosophy, where he taught

theology with great applause. He was especially distinguished for the zeal and ability with which he defended the immaculate conception of the Virgin against Thomas Aquinas. He is said to have demolished 200 objections to the doctrine, and established it by a cloud of proofs. It continued long a point of dispute between the Scotists and Thomists; and it was only in 1854 that the dogma was by papal authority declared a necessary doctrine of the Catholic faith, which it is now heresy to deny. In 1308, D. S. was called to Cologne to oppose the heresies of the Beguin brethren, and there he suddenly died, in the 34th or 43d year of his life. D. S. was mostly opposed to Thomas Aquinas in theological opinions, and held very tenaciously the doctrine of the absolute freedom of the human will, from whose spontaneous exercise he derives all morality. He was a realist in philosophy, and his followers are on that ground opposed to the Occamists, who were nominalists. See the article NOMINALISM. He defended his opinions in the style of dialectic then in vogue, and with an acuteness that got him from his contemporaries the name of Doctor Subtilis. When, however, at the revival of learning, the followers of Duns, or *Dunsmen*, saw that the hair-splitting style of reasoning was going out of fashion, they "raged," as old Tyndal says, "in every pulpit" against the new classic studies, so that the name gradually came to signify not only one opposed to learning, but one slow at learning; hence our word *dunce*, a blockhead. It would be difficult to indicate the nature of his speculative opinions without entering into particulars, nor are his writings as yet sufficiently known and explored for the formation of a decided judgment. The most famous of his works, besides his commentaries on the Bible and on Aristotle, is his Commentary on the Sentences of Peter Lombard, called the *Opus Oxoniense*, of which the *Opus Parisiense* is an abridgment. The chief edition of his works is that of Luke Wadding (12 vols., Lyons, 1639), but it is by no means complete. The controversies carried on so long between the Scotists and Thomists owed their bitterness not so much to zeal for science and religion, as to the jealousy existing between the Franciscans and Dominicans.

DUNSTABLE, a t. in the s. of Bedfordshire, at the e. base of the Chiltern chalk-hills or Dunstable downs, 18 m. s.s.w. of Bedford. It chiefly consists of one main street crossed by another. The houses are mostly of brick, some of them very old. Pop. '91, 4513. D. is the chief seat of the British straw-plait manufacture, which employs many women. Whiting is also made. In winter, many large larks are caught in the neighborhood, and sold chiefly in London as an article of luxury. Henry I. founded here a priory of black canons, of which the present parish church is a part. D. was in 1110 the scene of some of the earliest theatricals, the subject being the miracles of Catherine, by abbot Geoffry of St. Albans.

DUNSTAN, SAINT, was b. at or near Glastonbury, in Somersetshire, 925 A.D. He was of noble birth, and is said to have been remotely related to the royal family, as well as connected with the church through influential relatives. His early studies, which he pursued with extraordinary assiduity, were superintended by Irish teachers; but besides his professional learning, D. possessed a variety of accomplishments. He was an excellent composer in music; he played skillfully upon various instruments; he was a painter, a worker in design, and a calligrapher; a jeweler, and a blacksmith. While quite a youth he was presented at the court of king Athelstan, who seems to have been delighted with his music; but the courtiers envying the favor of the sovereign, denounced him as a dealer in sorcery, and procured his expulsion from court. D. now began to figure in a new character. Contiguous to the church of Glastonbury, he erected a cell, 5 ft. in length by 2 in breadth, the floor of which was sunk beneath the surface, while the roof, on the outside, was only breast-high, so that he could stand upright in it, though unable to lie at full length. This was at once his bed-chamber, his oratory, and his workshop. It was here that (according to the monkish legends) he had his most celebrated contest with the devil. One evening, while the saint was employed at his forge, the devil thrust his head in at the window, and began to tempt him with some immoral propositions. D. patiently endured the annoyance until his tongs were red hot in the fire, when, snatching them suddenly up, he seized the foul fiend by the nose, and held him till the whole neighborhood resounded with the clamor of his agony. Gradually, D. acquired a great reputation for sanctity; and on the accession of Edmund to the throne in 940, he was recalled to court; but in spite of the exploits and penances which had made his banishment illustrious, he was still opposed by the courtiers, who saw his ambition, and dreaded his talents. A second time D. was dismissed, but the king made him abbot of Glastonbury, and increased the privileges of that monastery. Edred, nicknamed *debilis pedibus* (weak in the feet), who succeeded Edmund in 946, showed D. great favor. The saint now began to distinguish himself as a statesman, and the vigorous policy of Edred's reign is affirmed to have proceeded from the inspiration of Dunstan. If such was the case, then to D. was owing the complete subjugation of the Northumbrian Danes. Edred was succeeded by Edwy in 955, who detested D., and not without reason, for the saint, on the day of Edwy's coronation, had grossly insulted his wife and her mother. Besides, Edwy had long suspected D. of peculation in his charge, and this outrage made his wrath overflow. D. was deprived of his clerical office, his places at court were taken from him, his so-called reform—viz., of compelling the clergy to become celibates—was frustrated, the monks were driven out of

their monasteries, their functions handed over to the secular clergy, and D. himself was banished. He fled to Flanders, narrowly escaping having his eyes put out by the messengers whom the infuriated king had sent after him. After D.'s flight, a rising took place among the Northumbrian Danes, instigated by Odo, archbishop of Canterbury, himself a Dane, and a friend of the expatriated saint. Edgar, the brother of Edwy, was chosen king of the whole of the island n. of the Thames, and D. returned in triumph from his brief exile. Meanwhile, Edwy's beautiful wife, Elgiva, had been seized and murdered, under circumstances of horrid cruelty, by the Mercians, who were armed in the cause of D. and Odo, or, as others say, by the immediate retainers of these churchmen themselves. Edwy himself died of a broken heart, or (according to an old MS. in the Cottonian library) was assassinated, in 958, and was succeeded by his brother Edgar. The latter, as a boy of 15, could exercise little authority: he was long a passive instrument in the hands of D. and his party, who used their power in establishing their cause over the whole island, in enforcing the celibacy of the clergy, and in driving out by main force from all abbeys, cathedrals, and churches, all such married clergymen as would not separate from their wives. At the same time, it cannot be denied that D. and the monks ruled the kingdom with vigor and success, and consolidated the detached states into compacter integrity and union than had ever been known before. The Danish districts of Anglia and Northumbria were divided into earldoms or governments; the fleet of the king was increased to 360 sail, which acted as a most efficient coast-guard, preventing the Norse rovers from making their usual destructive descents on the country. In 960, D. was made archbishop of Canterbury on the death of his friend Odo, when, according to custom, he went to Rome to receive the pall at the hands of the pope. He also induced Edgar to visit in person every part of his dominions annually, when courts of justice were held in the various districts, audiences and feasts given, and appeals heard. The many other beneficial measures of Edgar's reign, such as the reform of the coinage, and the endeavor to extirpate wild animals in the mountainous districts, are generally, and with good reason, attributed to Dunstan. The king, who was zealous for the celibacy of the clergy, was himself one of the most viciously profligate of the Saxon kings; yet D. could wink at his crimes, so long as he himself was allowed to carry out his "religious" schemes. On the death of Edgar, a fierce struggle took place between the partisans of Edward the martyr and his half-brother Ethelred. The cause of the former was espoused by D., who succeeded in placing his favorite on the throne; but the mother of Ethelred, named Elfrida, a beautiful but ferocious woman, caused Edward to be murdered in 979, and D. was compelled to place the crown on the head of Ethelred. The credit and influence of the great monk now declined; his threatenings of divine vengeance were treated with contempt; and soured and exasperated at the triumph of his enemies, he retired to his archiepiscopal city, where he died of grief and vexation, May 19, 988. D. was a man of extraordinary abilities. His vigor, his persistency of purpose, and his stern and unscrupulous disposition, would have elevated him to power in any age; but he possessed, in addition to these qualities, a deep knowledge of the weaknesses of human nature, and a clear and penetrating understanding, which enabled him to see what it was necessary and prudent for a ruler to do. Hence, though despotic to the last degree, he was not blindly so, like a commonplace despot. His ambition was ever under the control of his wisdom and his fixed ideas. But the grand designs of his life—viz., the complete subjection and conformity of the Anglo-Saxon church to that of Rome, and the extension and multiplication of ecclesiastical interests—are not such as excite the admiration of modern times, and all discerning people will regret the success that attended the unpatriotic labors of the saint. That he *was* successful, there can be no manner of doubt. Though personally out of favor at court in the latter years of his life, his efforts to spread his official influence were unceasing. At an early period in his career, he had introduced a new order of monks into the land, the Benedictines, whose strict discipline had changed the character and condition of ecclesiastical affairs, and in spite of the confusion and even opposition thus caused, he persevered to the end. Monasteries continued to be founded or endowed in every part of the kingdom; and such were the multitudes who devoted themselves to the cloister, that the foreboding of the wise Bede was at length accomplished—above a third of the property of the land was in possession of the church, and exempted from taxes and military service. D.'s *Concord of Monastic Rules* will be found in Reyner's *Apostolatus Benedictinorum in Anglia*, fol., Duac. 1626, page 77 of the appendix. Other writings have been attributed to him. See Wright, *Biog. Brit. Lit., Ang.-Sax. Period*. See also William of Malmesbury, Lingard's *History of England*, Kemble's *Saxons in England*, book ii., and *Memorials of St. Dunstan*, edited by W. Stubbs, M.A. (1875), a collection of six biographies of the saint.

DUNSTER, HENRY, d. 1659; b. England; educated at Magdalen college, Cambridge; went to Massachusetts, 1640, and in the same year became the first president of Harvard college. He was esteemed for piety and learning; but was compelled to resign his office, 1654, for having publicly opposed infant baptism.

DUNTON, JOHN, 1659-1733; b. in England, and apprenticed to a bookseller. In 1686, he migrated to New England to sell books. He conducted *The Athenian Mercury*, of which 20 vols. appeared. He was a prolific writer on religion, morals, and politics.

DUODECIMAL SCALE (Lat. *duodecim*, twelve) is the name given to the division of unity into twelve equal parts, as when the foot is divided into 12 in., and the inch into 12 lines; or the pound is divided into 12 ounces. This plan of counting has some advantages, as 12 admits of so many divisions into equal parts—viz., by 2, 3, 4, and 6. But the decimal scale, or division into ten equal parts, is now universally recognized as preferable, from its coinciding with our decimal system of notation.—**DUODECIMALS** is a term applied to a method of calculating the area of a rectangular surface when the length and breadth are stated in feet and inches.

DUODECIMO (Lat. *duodecim*, twelve) is that form of volume whose leaf is equal to the twelfth part of a folio—the folio being the large sheet called the *broadside*, folded once. A book is said to be *quarto*, *octavo*, *duodecimo*, etc., because the sheet of which the pages of the book are made up, has been folded into four, eight, twelve leaves, etc. *Quarto*, *octavo*, and *duodecimo*, are almost always written 4to, 8vo, and 12mo.

DUODENUM. See DIGESTION.

DU PAGE, a co. in n.e. Illinois, traversed by several railroads; 340 sq. m.; pop. '90, 22,551. The soil is very fertile, producing grain and fruit in abundance. Co. seat, Wheaton.

DUPANLOUP, FÉLIX ANTOINE PHILIBERT, b. Savoy, 1802; d. Paris, 1878. In 1825, he was ordained a priest; in 1827, was confessor to the young duke of Bordeaux; next year catechist to the Orleans princes; and in 1830, chaplain to the daughter of Louis XVI. In 1849, he became bishop of Orleans, where he first gave full scope to his plan for Christian education. In 1848, he was instrumental in having the first French expeditionary corps sent to the papal states. He was often in conflict with the censor of public worship in France. He opposed papal infallibility, but was prompt to accept the dogma when it had been promulgated. At the close of the war with Germany he was sent as a representative to the national assembly, where he favored a constitutional monarchy, the restoration of the Bourbons, and a complete system of education. He published a number of works on religious subjects. See *Life*, by Lagrange (1885).

DUPERREY, LOUIS ISIDORE, 1786-1865; a French navigator and scientist, native of Paris. He served under Freycinet in the voyage around the world (1817-20), in charge of the hydrographic operations. In 1822-25, he was in command of a vessel, making scientific explorations in the Pacific and along the coasts of South America. The later portion of his life was devoted to investigations in terrestrial magnetism. He was a member of the French academy of sciences.

DUPERRON, JACQUES DAVY, 1556-1618; a French cardinal. He was brought up a Protestant, but at the age of 20 abjured, and was appointed reader to king Henry III. He became noted as a pulpit orator, and rose to fame and fortune. Soon after Henry IV. came to the throne, Duperron converted him to the Roman Catholic faith, and after the taking of Paris, went to Rome to induce the pope to remove the interdict laid upon the kingdom. In 1604, he was sent to Rome as chargé d'affaires, and within a month was active in the election of two popes—Leo XI. (who reigned 24 days), and Paul V. While at Rome he was made archbishop of Sens, and soon afterwards a cardinal. Duperron was a zealous advocate of papal prerogative, and a man of great ability and untiring energy.

DU PETIT-THOUARS, ABEL AUBERT, 1793-1864; a French naval officer. From 1837 to 1839, he was circumnavigating the globe; rose afterward to be rear-admiral and commanded the Pacific fleet. In 1842, he placed the island of Tahiti under the protection of France, and the same year extended the protectorate over the Marquesas islands. In 1843, when the English missionaries and the natives of Tahiti rose against French rule, he placed the whole Society group under French domination. At the demand of the English government he was recalled. In 1846, he was made vice-admiral, and in 1849, was elected to the legislative assembly. He wrote *A Voyage Around the World*.

DUPIN, ANDRÉ-MARIE-JEAN-JACQUES, a French statesman and lawyer, was b. 1st Feb., 1783, at Varzy, in the department of Nièvre, and studied in Paris. In 1815, he was elected a member of the chamber of representatives, when he opposed the motion for proclaiming Napoleon II. successor to the throne. During the same year, he published his treatise, *Sur la Libre Défense des Accusés*. The attention excited by this work procured him the honor of defending Marshal Ney, and afterwards the English officers Wilson, Bruce, and Hutchinson, accused of having favored Lavalette's escape. He had also the honor to defend the poet Béranger in 1821. From 1825 to 1829, he was the advocate of the liberal party. In his pamphlet, *La Révolution de 1830*, he endeavored to prove the legal character of this revolution; and on the question being mooted whether the new king should assume the title of Philippe VII., D. declared "that the duke of Orleans was called to the throne not because he was a Bourbon, but although he was a Bourbon, and on the condition that he should not follow in the footsteps of his predecessors." After having been appointed to various important offices by the new government, D. found it necessary to pass over to the opposition, and was eight times chosen president of the chamber of deputies. On the revolution of 1848, he urged (but unsuccessfully) the chamber to proclaim the comte de Paris king of the French,

with the duchess of Orleans regent during his minority. In consequence of the confiscation of the Orleans estates in 1852, D. resigned his place, and retired for a time from public life; but in 1857, he consented to resume his previous office of *procureur-général* of the court of Cassation. He is the author of many important works, mostly on legal questions, among which may be mentioned his *Manuel du Droit Ecclésiastique Français*, which had the high honor of being censured by the congregation of the *Index* at Rome. In 1853 appeared his *Le Morvan; Topographie, Agriculture, Mœurs des Habitants, Etat Ancien, Etat Actuel*; and in 1857, *Règles Générales de Droit et de Morale tirées de l'Ecriture Sainte*. D. died in 1865.

DUPIN, FRANÇOIS-PIERRE-CHARLES, Baron, a French economist, brother to the preceding, was born at Varzy, in the department of Nièvre, 6th Oct., 1784, and educated at the polytechnic school, Paris. During the empire, he was actively employed as an engineer. Between 1816 and 1819, he made several visits to England and Ireland, to study the great works of construction in those countries. The results of his investigations appeared in his *Voyages dans la Grande Bretagne* (6 vols., Paris, 1820-24, with atlas)—a comprehensive statement of the advantages and defects of British internal administration, exhibiting in a popular form a complete view of the roads, canals, aqueducts, bridges, ports, etc., of this country. D. was about this time appointed member of the *académie des sciences*, and in 1824 was raised to the rank of baron. In 1828, he was elected deputy for the department of Tarn, and he took part with the liberal opposition. After the Feb. revolution of 1848, D. was elected member of the constituent assembly by the department of Seine-Inférieure. After the *coup d'état*, he became a senator of the empire. D. published a multitude of works on geometry, naval affairs, commerce, etc. He died in 1873.

DUPLEIX, JOSEPH FRANÇOIS, 1697-1764; Governor-General of the French establishments in India. He made several voyages to America and India, and displayed remarkable business aptitude. While governor in India his ambition was to extend French possessions, and he was frequently in diplomatic contest and in armed conflict with the English, at the same time endeavoring to win over the native princes. All this was theoretically stopped by the peace of Aix-la-Chapelle; still Dupleix continued his efforts, entering into negotiations for the subjugation of Southern India, and sending troops to the aid of two claimants of the sovereignty of the Carnatic and Deccan, while the English were engaged on the side of their rivals. His scheme failed, but the trouble continued until 1754, when Dupleix was recalled to France. He died in obscurity and want.

DUPLICATE RATIO. See PROPORTION.

DUPLICATION OF THE CUBE. See DOUBLING THE CUBE.

DUPLIN, a co. in s.e. North Carolina, watered by a branch of Cape Fear river, and intersected by the Atlantic Coast line railroad; 828 sq. m.; pop. '90, 18,690, includ. colored. The surface is level, and the soil sandy, with some fertile tracts. Productions—corn, rice, cotton, etc. Co. seat, Kenansville.

DUPONCEAU, PETER STEPHEN, LL.D., b. France, 1760; d. Philadelphia, 1844. He was bred to the law, and became secretary to baron Steuben, and with that soldier came to aid the Americans in the revolution. He was with Steuben through the war, and at its close took up his residence in Philadelphia, where, in 1785, he was admitted to the bar. He was offered, but declined, the chief-justiceship of Louisiana. He paid much attention to philology; and in 1819, as chairman of the committee on history, moral science, and general literature of the American philosophical society, he made a report on the structure of the Indian languages. In 1835, the French institute sent him the Volney prize for a similar work. In 1838, he published an essay on the Chinese system of writing. He also wrote on the cultivation of silk, and made efforts to establish its culture in the United States. He wrote on many other subjects, and his contributions to American history were valuable.

DUPONT, JACQUES CHARLES, styled DE L'EURE, a leader of the French liberal party, b. 27th Feb., 1767, at Neubourg, in Normandy. During the periods of the revolution and the empire, he filled several important offices. In 1813, he became a member of the legislative body, and acted as vice-president when this assembly was convoked by Louis XVIII. on the fall of Napoleon. During the Hundred Days he was elected to represent the department of Eure, and, after the battle of Waterloo, became vice-president of the chamber of representatives. After the revolution of 1830, he was appointed minister of justice, but at the end of six months sent in his resignation, and took his place in the ranks of the opposition. After the revolution of 1848, during the session of the 24th Feb., D. took the president's chair, and so far silenced the tumult of the populace, as to render it possible to appoint a provisional government, of which he was proclaimed president. He died in 1855.

DUPONT, PIERRE, 1821-70; b. at Lyons, the son of a workman of Provins. He was brought up by his cousin, who was priest of Roche-Taillée-sur-Saône, and, after leaving the seminary of Largentières, passed a short time in a lawyer's office. In 1839,

he found his way to Paris, where he succeeded in having some of his poems published in the *Gazette de France* and the *Quotidienne*. His first volume of poems, *Les Deux Anges*, appeared in 1841; and in 1847, he made a great hit by his peasant song, *J'ai deux grands bœufs dans mon étable*, which induced him to devote himself to lyrical poetry.

DUPONT, SAMUEL FRANÇOIS, 1803-65; b. N. J.; midshipman in the navy, 1815; lieut., 1826; commander, 1843. In 1845 he commanded Commodore Stockton's flagship in the Pacific squadron, and, during the war with Mexico, did service on the California coast, taking a leading part in the capture of Mazatlan. In 1856 he was made capt. and was sent on special duty to China. When the civil war began, he was in command of the Philadelphia navy-yard. In Sept., 1861, he was appointed flag officer, and given command of the South Atlantic blockading squadron. In Nov., he captured the forts at Hilton Head and Bay Point, the defenses of Port Royal harbor. In 1862, he was made rear-admiral. In April, 1863, he made an unsuccessful attack on Fort Sumter. In the following year, he was retired from active command.

DUPONT DE L'ÉTANG, PIERRE, Count, 1765-1838; a French officer, appointed brigadier in 1793, and gen. of division in 1797. He was with Napoleon at the overthrow of the directory; fought at Marengo; defeated a superior Austrian force at Pozzolo; won further laurels in the Austrian and Prussian campaigns, and, by a singularly bold movement, decided the victory of Friedland. In 1808, he commanded in Spain, where he was compelled to surrender his whole army. For this, he was degraded and imprisoned. On the fall of the emperor, he was restored to liberty and made minister of war, but was soon dismissed. After the second restoration, he became a member of the privy council. He was several times elected to the chamber of deputies.

DUPONT DE NEMOURS, PIERRE SAMUEL 1739-1817; a French statesman and economist, a prolific writer on questions of finance. In 1772, he was secretary of the council of public instruction of Poland. He went back two years afterwards to assist his friend Turgot in the French administration. With Turgot he went into retirement, where he wrote the memoirs of his friend, and translated Ariosto. In 1782, he was employed in constructing the treaty by which the independence of the United States was recognized. Subsequently he was a member of the council of state, and was appointed commissary-gen. of commerce. During the revolution he favored a constitutional monarchy, but was compelled to flee when the republicans triumphed. During his concealment he wrote his *Philosophy of the Universe*. He was found and imprisoned; but as Robespierre's head fell first, Dupont's was saved. He was one of the council of five hundred, and a thorough reactionist. In 1797, his house was sacked by a mob, and he narrowly escaped transportation. Finding France uncomfortable, in 1799 he and his family emigrated to the United States. In 1802, he returned, but declined to receive any political office, except that he was one of the commissioners to arrange the transfer of Louisiana to the United States. Jefferson, whose love of French democratic institutions was only equaled by his hatred of anything English, requested Dupont to prepare a scheme of national education, which was published in French in 1812. The scheme was never adopted in the United States, but some of its features were embodied in the French code. After Napoleon's first downfall, Dupont became secretary to the provisional government, and on the restoration of the Bourbons, he was made a councilor of state. The return of Napoleon caused him to leave France, and he spent the remainder of his life with his two sons, powder manufacturers, in the state of Delaware.

DÜPPEL, or **DYBBÖL**, a small fortified t. of the Prussian province of Sleswick-Holstein, in the peninsula of Sundewitt, 16 m. n.e. from Flensburg. During the war between Germany and Denmark, it was bombarded for more than a month by the Prussians, and finally taken, April 18, 1864. See **DENMARK**.

DUPRÉ, JULES, b. France, 1812; son of a porcelain manufacturer; with Rousseau and others, founder of the modern school of French landscape painters. At first he followed his father's craft, but exhibited at the Salon, 1831; received medals, 1833, and at the Universal exhibition, 1867; chevalier of the Legion of Honor, 1847. His works, which are not numerous, are realistic, "vigorous and full of poetry"; among them are "Water-course in Picardy," and "Sheepfold in Berri." He d. in 1889.

DUPUIS, CHARLES FRANÇOIS, a distinguished French *savant*, was the son of a poor schoolmaster, and was b. at Trie-Chateau, near Chaumont, 16th Oct., 1742. He obtained admission into the college of Harcourt, where he so soon acquired such extensive knowledge that at the age of 24 he was made professor of rhetoric in the college of Lisieux. At the same time he went through a course of law studies, and was admitted an advocate of the parliament. His acquaintance with Lalande introduced him to the study of mathematics and astronomy, and he was led to the thought of explaining mythology by means of astronomy. After several communications in the *Journal des Savans*, appeared his *Mémoire sur l'Origine des Constellations et sur l'Explication de la Fable par l'Astronomie* (Par. 1781). He was now appointed professor of eloquence in the collège de France, member of the académie des inscriptions, and shortly after a member of the commission of public instruction. Although he rather shunned the storms of the revolution, his reputation necessitated his becoming a member of the convention, next of the council of 500, and after the 18th Brumaire, of the legislative body. He was also one of the 48 individuals who formed the nucleus of the institut national. His great work, *Origine de tous*

les Cultes, ou Religion Universelle (12 vols., Par. 1794), which he had long withheld from fear of offending the religious world, was at last published at the instigation of the Cordeliers' club. This circumstance rendered the book more an object of party bitterness than its own purely scientific character would probably have called forth. It made a considerable impression on France at the time, and no doubt originated the famous commission afterwards appointed by Napoleon to explore Upper Egypt, which D. had pointed out as the general source of southern mythology. No less attention was awakened by his memoirs on the origin and spread of the Pelasgi, and on the zodiac of Denderah (q.v.). In his last work, *Mémoire Explicatif du Zodiac Chronologique et Mythologique* (Par. 1806), he attempts to demonstrate the unity of the astronomical and religious myths of all nations. He died 29th Sept., 1809.

DUPUYTREN, GUILLAUME, le Baron, an illustrious French surgeon and anatomist, was b. at Pierre-Buffière, in Limousin, 6th Oct., 1777; educated at the collège de la Marche in Paris; and on the formation of a new school of medicine there in 1794, was appointed to the office of *prosecteur*. In 1801, he was appointed *chef des travaux anatomiques*, and applied himself with intense ardor to pathological anatomy. In 1803, he was appointed assistant-surgeon, and later, in 1815, first surgeon in the Hôtel-Dieu. In 1813, he became professor of surgery to the medical faculty, an office which he exchanged, in 1818, for the professorship of clinical surgery at the Hôtel-Dieu. In 1820, Louis XVIII. conferred on him the title of baron, and in 1823, appointed him royal surgeon. He died at Paris, 8th Feb., 1835. D. possessed extraordinary penetration in diagnosis, a penetration that was generally justified by his bold and skillful operations, and an immovable firmness of nerve. He was the inventor of many ingenious modes of surgical operation and of various surgical instruments. He likewise made several important discoveries in pathological anatomy; and although he wrote very little, almost nothing indeed, he formed a large school of enlightened surgeons in his native country. Among his works may be mentioned *Leçons Orales de Clinique Chirurgicale faites à l'Hôtel-Dieu* (4 vols., Par. 1830-34), published by some of his students; and his *Traité Théorique et Pratique des Blessures par Armes de Guerre*, edited by Paillard and Marx (2 vols., Par. 1834).

DUQUESNE, ABRAHAM, Marquis, one of the most eminent naval officers of France, was b. at Dieppe in 1610, and trained under his father, the captain of a ship, for the naval service. In the war between France and Spain, he brilliantly distinguished himself at Corunna, Tarragona, Barcelona, and other places. During the minority of Louis XIV., when the navy of France was inactive, he entered the service of Sweden, which was then at war with Denmark. D. defeated the Danish fleet near Gothenburg in 1643, was elevated to the rank of vice-admiral, and by a succession of victories over the united fleets of Denmark and Holland, forced Denmark to conclude peace. He then returned to France, where he found the Spaniards prepared to support Bordeaux, which had declared itself for the party of the *Fronde* in 1650. D. immediately collected a squadron at his own expense, and compelled Bordeaux to submit. He was next employed in punishing the pirates of Algiers and Morocco who infested the Mediterranean. On the revolt of Messina against the Spanish government, France sent him to support the insurgents in the Mediterranean. With a small force, D. gallantly opposed the united fleets of Spain and Holland, commanded by De Ruyter, and in April, 1676, completely defeated his enemies off the coast of Sicily, in the vicinity of Mt. Etna. De Ruyter died a few days after. France thus obtained possession of the island of Sicily. Louis XIV. rewarded D. with the title of marquis and a considerable estate. On the revocation of the edict of Nantes, D. was made the only exception to the general decree of banishment issued against all Protestants. His last achievement was the humiliation of Genoa. D. died at Paris, 2d Feb., 1688. See *Duquesne et la Marine de son Temps*, by Henri Plon (Paris, 1872).

DUQUOIN, a city in Perry co., Ill., on the Illinois Central railroad; 77 m. n. of Cairo. It is in a rich agricultural, salt, and coal region, and has a large trade, foundry, machine shops, several coal mines and salt works, park, library, gas-works, national bank, high school, and daily and weekly newspapers. Pop. '90, 4052.

DURA DEN, between Cupar and St. Andrews, in Fifeshire, a small glen through which runs a tributary of the Eden, has become famous on account of the numerous and beautifully preserved fossil fish entombed in its yellow sandstone. This sandstone is one of the upper beds of the old red sandstone. It is developed in D. D. to a thickness of 300 or 400 ft., and is rich in the remains of ganoid fishes. They occur in clusters and detached groups, sometimes crowded together in an extraordinary manner, so that nearly a hundred specimens have been counted on a single slab about five feet square.

DURA MATER, the hard external membrane that envelops the brain. See NERVOUS SYSTEM.

DURA'MEN, or HEART-WOOD, in botany, the inner and fully ripened wood of exogenous trees. The division is often very marked between the *D.* and the *albumen* (q.v.) or sap-wood, the *D.* being more dense and compact, and its tubes thickened and filled with peculiar secretions of the plant, so that juices no longer freely flow through them. It is also very frequently of a darker color than the albumen; in ebony, it is black; and some other trees are remarkable for the peculiar color of their wood, which appears, however, only in the *D.*, and not in the albumen. As timber, it is much more

valuable and durable than the alburnum; and the distinction is as well known to the carpenter or cabinet-maker as to the botanist.

DURAN, AGUSTIN, 1789-1862; a Spanish poet, educated to the law in the university of Seville, and admitted as an advocate. In 1834, he was secretary of the board for the censorship of the press, and soon afterwards had a place in the national library, of which he became a director. He published a discourse on the influence which modern criticism had exercised on the ancient Spanish theater, a number of volumes of old romances, and a collection of old Spanish comedies. He is best known by his poem *The Three Citron Trees of the Orchard of Love*.

DURAN, EMILE AUGUSTE CAROLUS, a French artist who was born in Lille, July 4, 1837. He received his early art education at home, and at the age of twenty went to Paris, where he spent much time at the Louvre. In 1861 he went to Rome, and passed several years there, where he painted among other things, "L'Assasaine," which took a medal. This picture is now in the museum at Lille. After this he spent a year in Spain, and was strongly influenced in his style by Velasquez. His next work of importance was a design for a ceiling in the Luxembourg—"Gloria Mariæ Medicis." His greatest skill, however, is in portraiture. He has painted very many excellent portraits, and is distinguished for vigor, force of coloring, and power of direct realism. Among those worthy of notice are the portraits of Emile de Girardin, Pasteur, the equestrian portrait of Mlle. Croizette, and those of his own daughters. He is also an excellent teacher. He is a chevalier of the Legion of Honor, and of the order of Leopold.

DURANCE, a river in the s.e. of France, rises in the department of the Hautes-Alpes, near the base of Mont Gênevère, one of the peaks of the Cottian Alps. It flows through the department of the Basses-Alpes in a southerly direction; then curving westward, it proceeds towards the Rhone, forming the boundary between the departments of Vaucluse and Bouches-du-Rhone, and joins that river about 3 m. below Avignon. Its principal affluents are the Buech and the Calavon from the right; and the Ubaye, the Bleone, the Asse, and the Verdon from the left. Its total length is about 200 m.—no part of its course is navigable.

DURAND, ASHER BROWN, 1796-1886; b. N. J. He was at first a watchmaker, but in 1812 was apprenticed to an engraver in New York, becoming a partner in the business at the expiration of his time of service. His large engraving of Trumbull's *Declaration of Independence*, which cost him three years of work, brought him into notice, and thenceforward his path was one of success. In 1855, he quitted engraving and turned his entire attention to painting, at first portraits only, but later of natural scenery, in which he was ranked among the first of artists. He was for several years president of the New York national academy of design. He translated several works on art.

DURANGO, a state in n. Mexico, s. of Chihuahua, and w. of Coahuila; 38,009 sq. m.; pop. '95, 294,366. The w. part is mountainous, but the e. is level and fertile. In the n.w. is a large and desolate area inhabited only by Indians. The climate is cold on the mountains, but generally temperate on the plains. Sugar cane, tropical plants and fruits, cotton, flax, wheat, and other cereals are grown. There are many rich gold mines; some deposits of silver; and copper and lead are abundant. The chief town is the city of the same name.

DURANGO, sometimes called CIUDAD DE VICTORIA, or GUADIANA, a city of Mexico, capital of the state of Durango, near the foot of the s. slope of the Sierra Madre, 7295 ft. above the sea-level; pop. '95, 42,165. The city was founded in 1559 by Alonzo Pacheco as a military post for the control of the natives. It is the centre of a Roman Catholic bishopric, and has a cathedral, churches, government buildings, etc. The city is well supplied with water by warm and cold springs. It has trade with the adjoining states, and contains various manufactories. Near by is the famous Cerro del Mercado, a hill about 600 feet high, composed of iron ores.

DURANT, HENRY FOWLE (originally Henry Welles Smith); 1822-81; b. N. H.; d. Mass.; fitted for college with Mrs. Ripley, at Waltham; graduated at Harvard, 1841; read law and practiced with his father in Lowell; moved to Boston and was law-partner of Joseph Bell; was often Rufus Choate's junior counsel, and gained great prominence in the profession. He married, 1854, Pauline Adeline Fowler. Mr. D. abandoned the law, 1863; and devoted himself to Christian work, becoming a lay-preacher (1865-74); founded Wellesley college, 1871, giving it in all an amount variously estimated at from one to two million dollars.

DURAN TE, FRANCESCO, 1684-1755; an Italian composer, and one of the founders of the Neapolitan school of music. He was chapel-master in Naples, and in 1742 was at the head of the Conservatorio Santa Maria di Loreto in that city. He had unexampled fame as a teacher, and the most celebrated masters of the earlier school of Italian opera were among his pupils. Under Durante the Neapolitan school reached the climax of its celebrity, and it was in this school that the great traditions of Italian vocal art were established. As a composer he adhered to the severe style of the early Italian masters.

DURAZZO (called by the Turks *Dratsch*, and by the Slaves *Durtz*), a maritime t. of Albania, European Turkey, is built on the rocky peninsula of Peli, in the Adriatic. Lat. 41° 19' n., long. 19° 27' east. It is fortified, and is a place of considerable antiquity.

Its situation in a fertile district gives it an export trade in grain, oil, etc.; but in recent years, owing to partial failures in crops, and disease in olives, the exports have been small. D. has large imports of British manufactured goods; and also of sugar, coffee, rice, soap, and iron. Its pop. is under 5000.

D. is the ancient *Epidamnus*, which was founded about 627 B.C. by a conjoined band of Coreyreans and Corinthians under one Phaleus, a Heracleidan. It became a great and populous city, but was much harassed by internal party strifes, which ultimately led to the Peloponnesian war (q.v. under GREECE). Under the Romans it was called *Dyrrachium* (whence its modern name), and became the seat of a Roman colony, and an important landing-place for those sailing from Brundisium in Italy to Greece. Here Pompey was for some time beleaguered by Cæsar. Dyrrachium attained its highest consequence about the end of the 4th c., when it became the capital of the Byzantine eparchy of New Epirus. After being possessed successively by the Ostro-Goths, the Bulgarians, the Normans, and the Venetians, and been destroyed by an earthquake, it was finally conquered by the Turks in 1502, in whose possession it still remains.

D'URBAN. See NATAL.

DURBAR (Persian, *darbâr*, court, audience), a *levee* held by the governor-general of India, or by one of the native princes. The most noted durbar was that of Lord Lytton, at Delhi, January 1, 1877, when Queen Victoria was proclaimed Empress of India.

DURBIN, JOHN PRICE, D.D., 1800-76; b. Ky. At an early age he entered the Methodist itinerant ministry, studied while preaching, graduated at Cincinnati college, and was made professor of languages in Augusta college, Ky. In 1831, he was chaplain to the U. S. senate; in 1832, editor of the *Christian Advocate and Journal*; in 1834, president of Dickinson college; subsequently traveled in Europe, and in 1844 was prominent in the great slavery discussion which divided the church. He left the college in 1845, and was pastor in Philadelphia and presiding elder of the district. From 1850 to 1872, he was secretary of the missionary society, and to his exertions that society owes much of its success. He published *Observations in Europe, principally in France and Great Britain*, and a similar work on Palestine, Syria, and Egypt.

DÜREN (the Roman *Marcodurum*, whence its former name, Mark-Duren), an ancient t. of Rhenish Prussia, situated on the Roer, 18 m. e. of Aix-la-Chapelle. It is surrounded with walls, and has several churches remarkable for their fine architecture. D. has manufactures of woolen cloths, iron and steel ware, paper, soap, leather, oil, etc. In the vicinity are iron foundries and other factories worked by water-power, obtained from the Roer. Pop. '90, 21,551. Here Charlemagne, on his way to attack the Saxons, held diets in 775 and 779 A.D. After an obstinate resistance, D. was taken and burned by Charles V. in 1543.

DÜRER, ALBERT, the father of the German school of painting, "the prince of artists," as his countrymen loved to call him, was born at Nürnberg in 1471, according to an entry in his father's day-book, "on the day of St. Prudentius, on a Friday of the holy week." His father was a humble pious goldsmith, of whom the great painter said: "His daily speech to us was, that we should abound in love to God, and act faithfully towards our neighbor." D. was carefully educated and instructed by his father in the goldsmith trade, and at 15 executed a piece of work in chased silver representing the seven "falls of Christ"—in reference to the tradition that Christ fell seven times while bearing his cross to Mt. Calvary. Even as a child, drawing was his delight, and he was wont to astonish by the exactness with which he drew parts of the human body, and even whole figures, also lines and circles at the first stroke, without ruler or compass. His father therefore bound him apprentice, in 1486, to Michael Wohlgemuth, the chief Nürnberg artist, with whom he served three years. From 1490 to 1494 he traveled in Germany and the Venetian states; and on his return, his father "bargained" with Hans Frei, a skillful mechanic of Nürnberg to give him to wife his daughter Agnes, who turned out a perfect Xantippe, with nothing to recommend her but beauty and 200 florins, who embittered the whole course of his life, and, as his life-long friend Pirckheimer asserts, hastened his death. After receiving his diploma with all the honors and rights of a master, obtained for his famous drawing of Orpheus, he went to Venice in 1505, where he painted a picture of the martyrdom of St. Bartholomew, and one of Adam and Eve, afterwards bought for the gallery at Prague. He also visited Bologna, where it is said that he met with Raphael, who esteemed him highly, and that each painted for the other his portrait. After this journey, his fame spread widely, and the Emperor Maximilian appointed him court painter, with an annuity of 100 florins; and Charles V. confirmed the same in a document still to be seen in the Nürnberg archives. In 1520, he visited the Netherlands with his wife and their maid-servant; and they were splendidly entertained at Antwerp and Bruges by the painters, a costly dinner being served on vessels of silver, the whole party conducting them home late in the night by the light of many torches. His expenses were often defrayed at the inns, and he was escorted free from city to city. He says in his journal: "The people did obeisance unto me as if they were leading some great lord." D. warmly embraced the doctrines of the Reformation; and his journal contains a long lamentation and prayer on hearing that Luther had been carried off to the castle of Wartburg. At Antwerp he records: "I was now overcome by a strange sickness, of which I never yet heard from any man."

This was in 1521, and the "strange sickness"—no other than consumption—took yet seven years to consume his strong frame; he d. in his native city, 6th April, 1528, in his 57th year.

D's facility was almost incredible. He *thought out* his works, and then executed them without sketch, and never altered a line. Of his coloring, Fuseli says: "Dürer excelled Raphael in juice and breadth of coloring as much as Raphael excelled him in every other quality." His drawing was perfect. So quaint were the presentments of his genius, he may be called the Chaucer of painting. In his portraits, he not only caught the expression, but delineated character and passion. D. was the inventor of the art of etching. He found wood-engraving in its infancy, and raised it to be a pattern for all times; he also discovered the method of bringing out wood-cuts in two colors. Historical and other paintings by D. are to be seen at Vienna, Munich, Prague, Dresden, and Nürnberg. The oldest of his pictures extant is the portrait of himself of the year 1498, in the Florentine gallery. His engravings and wood-cuts are so numerous, that with all his surpassing diligence it is known that for many of them he only gave the designs: 262 wood-cuts are known marked with his name, the most famous of which are the "Great Passion," the "Little Passion," his favorite work, the "Revelation of St. John," and the series called the "Triumph of Maximilian," a copy of which is in the Advocates' Library in Edinburgh. In the British museum, there is a volume with more than 200 original drawings by D., formerly in the collection of sir Hans Sloane, also an exquisite carving in hone-stone, of the birth of St. John, and a number of engravings, bequeathed by Mr. Nollekens. His own list of his works enumerates 1,254 pieces.

In the last three years of his life he published works on perspective and measurement, on fortification, and on human proportion, of which last he only lived to correct the first volume. His life has been written by Heller, Roth, Campe, and others; in English by W. B. Scott and Mrs. Heaton. Deeply religious and reverent, he was also of a cheerful temperament, and was long chief magistrate of his native t., where there is a brass statue of him, designed by the famous sculptor Rauch, and his house is still to be seen at the corner of a street called by his name. See illus., CORREGGIO, ETC., vol. IV.

DURESS is a legal term, signifying personal restraint, or fear of personal injury or imprisonment, imposed upon a person to constrain him to perform some act injurious to himself or another; as when a man's life is threatened or his liberty restrained to compel him to sign a bond, or to relinquish some right, or to commit a misdemeanor. A bond signed under D. is voidable in law. The same is the case when the violence or the threat thereof is exercised on the wife, or husband, or other near kindred of the contracting party. The violence or threats must be such as are fitted to operate upon a person of ordinary firmness and to inspire a genuine fear. If a man's goods be in D.—that is unlawfully detained—and he pay money under protest to release them, a suit will lie for its recovery.

DURFEE, JOE, LL.D., 1790–1847; b. and d. in R. I. He graduated at Brown university in 1813; studied law; was elected to congress in 1820, and served four years; was chosen a number of times to the state legislature, and in 1828 was speaker of the lower house. In 1833, he was appointed associate justice of the state supreme court, and became chief-justice in 1835. He was the author of *What Cheer*, a poem in nine cantos, and of *Panidea*, a treatise to prove the presence of God throughout all nature.

DUR'FEY, THOMAS, a writer of plays and poems in the reign of Charles II., with whom he was a favorite for his wit, liveliness, and songs. In literature, he is best remembered for his collection of songs, entitled *Pills to Purge Melancholy*, a work found only among the rarities of private libraries. Tom D., as he was usually called, lived to entertain queen Anne by singing his catches and glees; but being without any settled means of support, he concluded his career in poor circumstances. Addison, who was his friend, pleaded in his behalf—"He has made the world merry, and I hope they will make him easy, as long as he stays among us. This I will take upon me to say, they cannot do a kindness to a more diverting companion, or a more cheerful, honest, good-natured man." He died at an advanced age in 1723.

DURGA. See **UMA**.

DUR'GA PU'JA. See **UMA**.

DURHAM, a co. in northern N. Carolina, formed in 1881; 292 sq.m.; pop. '90, 18,041. Co. seat, Durham.

DURHAM, a co. in Ontario, dominion of Canada, on lake Ontario, intersected by the Grand Trunk and Midland railroads; 620 sq.m.; pop. '81, 36,427. Chief town, Port Hope.

DURHAM, a maritime co. of the n.e. of England, between the Tyne and Tees, bounded n. by Northumberland, e. by the German ocean, s. by Yorkshire, w. by Cumberland and Westmoreland. It is 48 m. long, by 39 broad, with 32 m. of coast, generally low, but with some cliffs; area, 973 sq.m., five sevenths being arable. The surface is hilly, and slopes to the east. In the w., which is waste but rich in minerals, are branches of the Pennine chain, rising in Kilhope law, 2,196 ft.; Colber law, 1678; and Pontop pike, 1018. The two chief branches inclose the valley of the Wear, and send forth several parallel ranges, declining toward the coast, and inclosing many fertile

tracts and sheltered valleys. The chief rivers are the Wear, Tyne, and Tees, navigable respectively for 12, 15, and 10 miles. The rocks are new red sandstone, magnesian limestone, millstone grit, carboniferous limestone, rich in lead; and coal-measures, forming the valuable D. coal-field, 25 by 10 m., with many faults, and with about 40 beds of coal, 3 to 10 ft. thick. Basalt and greenstone trap dikes intersect the w. part of Durham. The mineral products are coal, limestone, black marble, freestone, ironstone, firestone, slate, millstone, grindstone, and lead. Large furnaces for the production of iron are in operation in various parts of the county. D. is one of the chief counties in England for the production and export of coal, and also for the mining of lead. Salt is prepared from brine at several places. Manufactures are numerous, including chemicals, glass, iron, earthenware, sails, ropes, and anchors. Shipbuilding is an important industry. The soil is a clayey or dry loam. The chief crops are oats, barley, wheat, turnips, beans, and pease. The Teeswater breed of short-horned cattle is well-known, and excellent draught and saddle horses are raised. Pop. '91, 1,016,559.

DURHAM COUNTY PALATINE, one of the three counties palatine of England, the other two being Lancaster and Chester. For the privileges of a co. palatine, see **PALATINE**. The co. palatine of D. existed by prescription. It was the only co. palatine in the hands of a subject, and belonged to the bishop of Durham. By 6 and 7 Will. IV. c. 19, the co. palatine of D. is separated from the bishopric, and vested in the crown.

DURHAM, a parliamentary and municipal borough, and ancient episcopal city of England, near the middle of Durham co., built around a steep rocky hill 86 ft. high, nearly encircled by the Wear. On the top of the hill are the cathedral and castle. Ancient walls partly inclose the hill, from which are fine views of the fertile wooded country around, and of the suburbs across the river. The chief manufactures of D. are carpets, paper, and iron, and it has coal and blast furnaces. In the vicinity are coal-mines, and saline, chalybeate, and sulphureous springs. Pop. '91, 14,863. It sends one member to parliament. D. arose about the year 995, when bishop Aldune brought here St. Cuthbert's bones from Ripon, and built a church to enshrine them. On the site of this church, bishop William de Carilepho, about 1093, began the present magnificent cathedral, a Romanesque structure in the form of a Latin cross, to which additions continued to be made till about 1500. It thus exhibits the gradual changes of style between these periods. It was restored during last century, and has lately undergone extensive renovation. It is 507 by 200 ft. with a central tower 214 ft. high, and two west towers 138 ft. high. The cathedral contains many old monuments. Here lie St. Cuthbert's (q. v.) remains. Here also are Bede's tomb and some manuscripts said to be in his handwriting. Cardinal Wolsey was a prelate here. The castle, formerly the residence of the bishops of D., but now the seat of the university of D., was founded about 1072 by William the Conqueror, in the Romanesque style, but it has since been much altered. The dormitory, now the new library of the cathedral, which belonged to the monastery of D., is one of the finest in England. Two of the bridges over the Wear were erected in the 12th century. D. was often attacked by the Scots.

A college was founded here in 1290 by the prior and convent of Durham. It was abolished, however, at the dissolution of monastic houses in the reign of Henry VIII., and its endowments given to the dean and chapter of Durham. Under the commonwealth, Cromwell instituted a college here, and endowed it with the sequestered revenues of the dean and chapter, to whom, however, these revenues again reverted at the restoration, when the college was suppressed. The present university of D. was opened for students in 1833, under the provisions of an act of parliament, obtained by the dean and chapter during the previous year. A royal charter in 1837 empowered the university to bestow degrees. The D. university comprises professorships in divinity and ecclesiastical history, classical literature, mathematics and astronomy, and medicine, with lectureships in Hebrew, classical literature, etc. It has two colleges—University college, and bishop Hatfield's hall. See **UNIVERSITY**.

DURHAM, town and co. seat of Durham co., N. C., noted as a tobacco market and as a winter resort; on the Norfolk and Western, Seaboard Air line, and Southern railroads, 26 miles n.w. from Raleigh. Near this point, April 26, 1865, General Johnston, of the confederate army, surrendered to General Sherman, and the single tobacco factory of the place came into the hands of the federal soldiers, whose favorable report of its products led to an increased demand, to the enlargement of the business, and to the establishment of other houses. There are now many manufactories of tobacco and snuff, including the largest granulated smoking-tobacco factory in the world. Tobacco boxes, fertilizers made from tobacco dust, tobacco bags, cotton goods, and bobbins and shuttles are among other products. There are churches, national bank, Trinity College (Meth. Epis., S.), graded schools, Watts hospital, electric lights, and several daily and weekly newspapers. Pop. '80, 2041; '90, 5485.

DURHAM, JOHN GEORGE LAMBTON, Earl of, an English statesman, was the son of William Henry Lambton, esq., of Lambton Hall, county of Durham, and was born at the family seat, 12th April, 1792. The Lambton estate was not very large, but had been in the possession of the family since the 12th c., the male issue having never once failed during all that period. The antiquity of the family, however, exercised no narrowing influence on his opinions, which were markedly radical. He was educated at

Elton; and when only twenty years of age, married at Gretna Green a Miss Harriet Cholmondeley, who died in the course of a few years. In 1814, he was returned for his native county, and though he did not speak on many questions, he took part in all the more important debates, opposing the corn-law bill of 1815, the additions made to the incomes of the royal dukes, the indemnity bill of 1818, the six repressive bills brought in by government to coerce the people after the great reform meeting at Manchester in 1819, etc. Two years after, he submitted to the house of commons a scheme of parliamentary reform, which of course was not accepted. In 1828, he was raised to the peerage, with the title of Baron Durham of the city of Durham. He was one of the four persons who drew up the reform bill, and supported it in the house of lords. In 1833, lord D. was dispatched on a mission to Russia. On his return to England, his "advanced liberalism" was proclaimed at a dinner given to lord Grey at Edinburgh, in 1834, and in various other parts of the country. After a second mission to Russia, he was appointed governor-general of Canada, where he arrived in May, 1839; but on account of a misunderstanding with the home government, he took the extraordinary step of returning to England in the course of half a year, without either being recalled or obtaining the royal consent. D. died at Cowes, Isle of Wight, 28th July, 1840. He left a son and three daughters.

DURHAM, JOHN S., b. 1861 of colored parents, graduated at the Univ. of Pennsylvania in 1886; became a member of the editorial staff of the Philadelphia *Bulletin*; was appointed by President Harrison, consul to San Domingo in 1890, and minister to Hayti in September, 1891.

DURIAN, or **DURION**, *Durio zibethinus*, a fruit-tree of the Malayan archipelago, of the natural order *sterculiaceae*, of the same tribe or sub-order (*bombaceae*) with the silk-cotton tree. It is a lofty tree, with leaves resembling those of the cherry, and large bunches of pale-yellow flowers. The fruit is of the size of a man's head, roundish oblong, with a hard thick rind, covered with soft spines, so that it somewhat resembles a hedgehog rolled up. The pulp of the fruit is of a sort of creamy substance and delicious taste, but has a smell which is at first very repulsive to Europeans. Persons accustomed to it, however, universally regard the D. as one of the very finest fruits of the east. It brings a higher price than any other fruit in the market in India. It contains 10 or 12 seeds, as large as pigeons' eggs, which, when roasted, are not inferior to chestnuts. One tree yields about 200 durians in a year.

DÜRKHEIM, a t. of Rhenish Bavaria, on the Isenach, 20 m. n. from Landau. It stands at the entrance of the valley of the Isenach, at the base of hills which skirt the plain of the Rhine, and the neighborhood is very beautiful. Many invalids resort to D. on account of its amenity, and to take the *grape-cure*. It has manufactures of tobacco, cutlery, and paper. D. was formerly the residence of the princes of Leiningen-Hardenburg, whose palace was burned by the French in 1794. Not far off are the salt-works of Phillipshall. The summit of a neighboring height is crowned by a rampart of loose stones, 6 to 10 ft. high, 60 to 70 ft. wide at the base, and inclosing a space of about two sq. m., called the Heidenmauer (heathens' wall), which the Romans are said to have built to keep the barbarians in check, and where Attila is said to have passed a winter, after having wrested the fortress from the Romans, when pressing on his way to Rome. Pop. '90, 6081.

DURLACH, an old t. of Germany, in the grand-duchy of Baden, is situated on the river Pfalz, at the base of the Thurmberg, a highly cultivated hill, 3 m. e. of Carlsruhe. D. manufactures linen, tobacco, chicory, vinegar, and machinery, and has extensive fruit and grain markets. The environs abound with orchards. On the summit of the Thurmberg are the ruins of an old castle. D. is a station on the Mannheim and Basel railway. Pop. '90, 8240.

DUROC, GÉRARD CHRISTOPHE MICHEL, 1772-1813; **Duke of Friuli**; a French gen. who served in the wars of the revolution, in the army of Italy, and in the Egyptian campaign. He was a prominent actor in the overthrow of the directory, and was appointed lieut. gen. and governor of the Tuileries. He went on diplomatic service to Sweden, Denmark, Russia, Prussia, and Saxony. In the battle of Austerlitz he was Oudinot's successor; and was near Napoleon in the subsequent campaigns. At the battle of Bautzen, while escorting Napoleon to a position that would overlook the field, Duroc was struck by a cannon-ball, and died soon afterwards. Napoleon afterwards bought the house where he died, and built on the spot a monument to his memory.

DURRA, **DOURA**, **DURRA MILLET**, **INDIAN MILLET**, or **SORGHO GRASS**, *Sorghum*, a genus of grasses, distinguished from *andropogon*—in which many botanists prefer to include it—only by the ovate or oblongo-ovate hermaphrodite spikelets, with glumes that have three small teeth at the extremity. The species are generally annual, tall, broad-leaved grasses, having strong culms filled with a juicy and saccharine pith, and large panicles. Several of them are cultivated as corn-plants chiefly in Asia and Africa, particularly the common D. (*S. vulgare*, or *andropogon sorghum*, *holcus sorghum* of the older botanists), also called *joar* and *javaree* in India. It grows 4 to 8 ft. high, with thickly crowded panicles. It is a coarse, strong grass; its grain is round, a little larger than mustard seed. It is a native of the East Indies, is extensively cultivated in Asia, and may perhaps be described as the principal corn-plant of Africa. It is also cultivated to a considerable

extent in the s. of Europe. It is sometimes cultivated in Germany, but the summer is not sufficiently long and warm to secure its greatest perfection. The climate of Britain is still less suitable. *D.* yields a very abundant produce, in this respect even rivaling maize, but the meal does not make good bread; it is excellent, however, instead of rice for puddings, and is prepared in various ways for food. The culms and leaves, although coarse, are excellent food for horses and cattle, as is also the grain.—The seeds of the SHALOO or SUGAR-GRASS (*S. saccharatum*) are more pleasant to the taste than those of the common durra. It is cultivated in the warm parts of Asia and in Africa, and has a diffuse and very spreading panicle. The sweet pith of the culm is eaten, and is also of value as a source of sugar. This plant has been cultivated to some extent in the Veronese, and its cultivation has been recently introduced into North America—where it is called CHINESE SUGAR-CANE—in order to the production of sugar. It seems likely to form an important new feature in American agriculture, succeeding well at least as far n. as Maine, and yielding sugar in large quantity. In Britain, it succeeds only in the warmest parts. As a forage plant, it is very nutritious when young.—KAFFER CORN (*S. Caffrorum*) has a very diffuse umbel-like panicle, with branches bending down all around. The culm is more than the height of a man, and has a sweet pith. This species is largely cultivated in s. Africa, both by Kaffers and by the colonists. By the latter, the grain is chiefly used for feeding horses.—*S. halepense* is a troublesome weed in the fields of the n. of Italy, like couch-grass. The sweet runners of the roots are kept by the apothecaries of that country as a substitute for sarsaparilla, under the name of *garmignone*, or *smilace dolce*. See SORGHUM.

DÜRRENBURG, a small t. of Prussian Saxony, 5 m. s.e. of Merseburg, deserves mention only for its productive salt springs.

DÜRRENSTEIN, a village of lower Austria, is situated in a highly picturesque locality, on the left bank of the Danube, about 45 m. w.n.w. of Vienna. It is chiefly notable for the ruins of a castle, which stand upon a ridge of bare rock overlooking the town. A peculiar interest attaches to this grand but desolate and shattered fortress, from its having been the prison in which Richard Cœur-de-Lion was confined by Leopold of Austria for 15 months.

DURSLEY, a t. in the w. of Gloucestershire, amid picturesque scenery, at the base of a steep beech-covered hill, and near the Cotswold hills, 15 m. s.s.w. of Gloucester. It is irregularly built, and chiefly consists of three streets, diverging in different directions from the market-place. Pop. about 2500. In the oolitic and lias formation in the vicinity is a quarry of tophies or puffstone, which is a soft and easily worked stone, but hardens on exposure to the air.

DURUY, VICTOR, historical writer, professor, and minister of public instruction in France, was born at Paris in 1811. Members of his family were employed as designers in the lace-works at Gobelins, and he was, in his boyhood, intended to follow their occupation. He began his classical studies at the collège Rollin, then called the collège Sainte-Barbe; but the progress he made was rapid enough to enable him to enter the Ecole Normale in his 19th year. He was, in 1833, teacher of history in the college of Rheims, professor of history at Paris, in the collège Henri Quatre, afterwards called the collège Napoléon, which position he held until 1861. He gained a considerable reputation as a writer on history and geography. Most of his books were school-books, but they were so good that they had a great influence upon the teaching of history in French schools. He got the degree of doctor of letters in 1853. In 1861 he was appointed an academy-inspector of the academy of Paris; next, master of conferences at the Ecole Normale; then inspector-general of secondary instruction; and, finally, professor of history in the Ecole Polytechnique. From the last-named post he was, on the 23d June, 1863, by imperial decree, advanced to the office of minister of public instruction.

D., who, by activity and ability combined, had made himself distinguished while filling a somewhat humble office, was no sooner charged with the control of public instruction, than he began to carry out important changes in the educational system of France—which had undergone scarcely any modification since the introduction of Guizot's education law in 1833. He instituted a tribunal for trying charges brought against professors. He remodeled the examinations for the degree of bachelor of letters. He first suspended, and afterwards abolished, the division of the highest class, which had prevailed in schools of secondary instruction, into two sections: the one rhetorical or literary, the other philosophical (scientific)—thus making the study of science obligatory upon all who passed through the school curriculum. He introduced other changes into the course of secondary instruction, of which the most important—at any rate, that which has been most discussed—was the teaching of contemporary history in the lycées, or departmental public schools. Previously, the text-books used in teaching history in these schools were Bossuet's *Histoire Universelle* and Montesquieu's *Grandeur et Décadence des Romains*—these works being supplemented by the lectures of the professor. *D.* had a text-book prepared for their use, containing a compendium of French history to so late a period as that of the recent French invasion of Mexico; and it has been alleged that this work, and the circulars which the minister published for the instruction of teachers of history, disclosed a systematic attempt to imbue the youth of France with a Bonapartist view of recent history—to make the teaching of the schools a source of future strength to the empire. Perhaps it would be difficult altogether to acquit *D.* of the Machiavellian design imputed to him. As to primary instruction, he

officially proposed to the emperor to make it compulsory and gratuitous; but the proposal was badly received by the public, and the emperor withheld his sanction. He also procured legislative sanction for a measure which greatly increased the number of primary schools, especially of girls' schools, for which the provision made had previously been inadequate. The night-schools for adults, too, were greatly improved and extended under his care; and the educational libraries established in connection with them proved very effective aids to the education of the working-classes. He procured an enactment for establishing schools of special secondary instruction, intended mainly to teach the elements of science to boys of the lower middle class who are to be engaged in manufactures or commerce, and, in the country districts, to give systematic instruction in the methods of agriculture and horticulture.

The matters which have been mentioned are only a few of those which D., with bold and unsparing hand, leaving no part of the system of education untouched, dealt with while in office. It is unquestionable that he in many cases effected improvements; but the spirit and tendency of his administration were strongly impugned, and his conduct was jealously watched by the best portion of French society. It is alleged that he steadily attempted to secure the entire control of education for the state, and to use national schools as a state instrument. For example, the changes which he introduced in the examinations for the degree of bachelor of letters are said to have been intended to force candidates to study at the government establishments; and certainly, if their working has not been misrepresented, their tendency seems to be to place candidates educated elsewhere at a disadvantage. In such charges as this, there may be exaggeration or misconception; but D. is an ardent Bonapartist, and it is natural to suppose that he intended the results which his acts were calculated to produce. He resigned the office of minister of public instruction in 1869. He was decorated with the legion of honor in 1845, and was promoted to be officer, commander, and grand commander of that order. He was an officer of the Turkish order of Medjidie since 1857. He d. in 1894.

Of D.'s numerous works, not a few were written for a series published under the title *L'Histoire Universelle*, of which D. was the editor. His earliest work, *Géographie Politique de la République Romaine et de l'Empire*, first appeared in 1838; it was followed by *Géographie Historique du Moyen Age* in 1839; *Géographie Historique de la France* in 1840; and *Atlas de Géographie Historique Universelle* in 1841. In 1840, he published the first volume of a work of greater pretensions than these—*Histoire des Romains et des Peuples soumis à leur Domination*; a second volume appeared in 1844; a third in 1853, under the title *L'Etat du Monde Romain vers la Fondation de l'Empire*; and the final volume appeared in 1886. *Histoire Sainte d'après la Bible* (1845), *Histoire Romaine* (1848), *Histoire de France* (1852), *Histoire Grecque* (1851), were among his subsequent productions. In 1862, appeared two volumes of his *Histoire de la Grèce Ancienne*, a work which has been crowned by the French academy. *Histoire Moderne* (1863), *Histoire Populaire de la France* (1863), *Histoire Populaire Contemporaine* (1864), *Introduction Générale à l'Histoire de France* (1865), were works prepared under his direction. English editions of his histories of Greece and Rome, edited by Prof. Mahaffy, appeared in 1888.

DURYEA, JOSEPH TUTHILL, D.D., b. Long Island, N. Y., 1832; a graduate of the college of New Jersey, where he was teacher of Greek and rhetoric; in 1859, graduated at Princeton theological seminary; pastor of a Presbyterian church, Troy, N. Y., 1859-1868-79, pastor of Classon avenue Presbyterian church, Brooklyn; 1879-88, pastor of the Central Congregational church, Boston; in 1888-95 pastor of the first Congregational church, Omaha, Neb. He is a broad and deep thinker, and his literary style is careful and finished, though his preaching is mostly without notes.

DUSE, ELEONORA, Italian actress, was born at Vigevano, a village between Piedmont and Lombardy in 1861. Hers was a family of actors, her grandfather having founded a theatre in Padua, and she appeared on the stage when 13 years old. Her early stage-life was a succession of privations and hardships which eventually seriously impaired her health, until she was recognized at Naples as one of the greatest actors, if not the greatest of her time. Her career has since been one of uniform success. She appeared in New York and in London in 1893, and again in 1896, and in Paris in 1897. Her most successful rôles have been Juliet, Francesca da Rimini, Camille, Fernande, Magda, etc. She discarded many of the customary mannerisms of the stage, and gained much of her extraordinary dramatic power from the abandonment of a great deal that is unnatural yet conventional in modern acting.

DUSICYON, a genus of *canidae*, or sub-genus of *canis* (dog), consisting of a number of South American species or varieties, sometimes called aguara dogs. They have the body rather long in proportion to their height, and of considerable bulk, the muzzle rather sharp, eyes somewhat oblique, and aspect somewhat fox-like, the tail also has a more or less perfect fox-like brush. They are more diurnal than nocturnal in their habits, live in burrows, and feed on birds and small quadrupeds. Some of them have been domesticated by the Indians.—Akin to the aguara dogs, but more fox-like, are the aguara foxes (*cerdocyon*, q.v.).

DUSKY BAY, a large inlet on the s.w. coast of Middle isle, in New Zealand, is in lat. 45° 40' s., and long. 166° 20' east. It was entered by Cook in 1769, who here found good anchorage.

DÜSSELDORF, the chief t. of the district of Düsseldorf, in Rhenish Prussia, and the capital of the former duchy of Berg, is situated in the center of a fertile district, on the right bank of the Rhine, at the confluence of the Düssel with that river, in lat. $51^{\circ} 13'$ n., long. $6^{\circ} 45'$ east. It was formerly fortified, but its ramparts were converted into gardens and promenades at the treaty of Luneville, 1802. It is seated in the midst of extensive garden-grounds, and is well built. The streets, the houses of which are built of brick, are regular and spacious; while the rows of trees with which many of them are planted, greatly enhance their appearance. D. is divided into the *Altstadt*, on the right bank of the Düssel; the *Karlstadt*, founded in 1786 by the elector Karl Theodore, on the left bank; the *Neustadt*, on the Rhine; and the recently built *Friedrichstadt*, to the south. A colossal equestrian statue of the elector Johann Wilhelm, who founded a famous picture-gallery here in 1710—the pictures of which, however, were removed to Munich in 1805—stands in one of the five squares of Düsseldorf. The Düsseldorf academy was founded in 1767, reorganized in 1822, and attained great eminence during the years 1822–26, under the management of Cornelius and Schadow. The art-union for the Rhine provinces and Westphalia was founded here in 1828. The principal buildings of D. are the old electoral palace; the present palace, the residence of the governor of the province; the government house, the observatory, town-hall (built in 1567), theater, gymnasium, and public library. Of the ecclesiastical edifices, the most remarkable are the churches of St. Andrew and St. Lambert, and the church of the Jesuits, a handsome and highly ornate structure, having two steeples. The Hofgarten, one of the finest public gardens in Germany, is a very agreeable promenade. D. has manufactures of woollens, cottons, leather, hats, tobacco, jewelry, mirrors, railway carriages, etc., and its trade and industries generally are steadily progressing. A great part of its importance may be said to be derived from its position on the Rhine, as on this account great quantities of goods are sent to D. from the surrounding districts for exportation. Pop. '90, 145,738, most of whom are Catholics. Along with the duchy of Berg, D. came into the possession of Prussia in 1815. It was made a free port in 1829, and since that time it has prospered. It has daily communication with Mayence and Rotterdam by the Rhine steamers. Industry and commerce have likewise received a new impulse since D. became the central point of several lines of railway.

DÜSSELDORF SCHOOL OF PAINTING. This institution, founded in Düsseldorf by Prince Charles Theodore in 1767, did not become famous until, in 1822, it was reorganized by King Frederick William, and put in charge of Cornelius, under whose direction it took at once a high rank. Cornelius was succeeded in 1826 by Schadow, and in 1859 by Bendeman. From 1864, the institution was managed by curators, till in 1873, Wiscelinus of Weimar was chosen director. The school has exerted a wide influence upon art, in America as well as in Europe. Several of the most famous American artists have studied there, and among those who have done much to introduce and popularize its methods and style in this country may be mentioned Eastman Johnson, George H. Hall, Leutze, and Bierstadt. The academy possesses 14,000 original drawings and sketches by the great masters, and 24,000 engravings. The German artists whose names have become most familiar in connection with the school are Cornelius, Lessing, Achenbach, Baur, Tidemann, and Knaus.

DUST, COSMIC OR METEORIC. The constant presence of dust in the air may be demonstrated by the familiar experiment of admitting a beam of sunlight into a dark room. The path of the beam becomes plainly visible owing to the reflection of the light by the myriad particles floating about. Were the air quite pure, nothing of the sort would be seen. To prove that dust exists in the open air also, if we cover a plate with a thin coating of glycerine and expose it to a strong wind, numerous particles of matter will be found deposited on its surface. Examined with the microscope, these prove to be pollen-grains from flowers, bits of vegetable fiber and hairs, mineral and rocky fragments of all kinds, and *iron*. The presence of vegetable and mineral particles is easily explained; but not so the iron. Showers of dust are common near active volcanoes. Mr. Whympers witnessed an eruption of Cotopaxi in which dust and ashes of the supposed weight of 2,000,000 tons were thrown into the air. But dust-showers of other than volcanic origin have frequently been observed in ancient and modern times. Nordenskjöld found particles of metallic iron and nickel in the snow at Stockholm in 1871, on the Polar ice, and in the snows of Finland. Hailstones have been found to have a metallic nucleus of iron pyrites. Glycerined plates exposed to the winds have had iron particles deposited on them. Dr. Reichenbach, of Vienna, has shown that the dust which covers the tops of mountains and other elevated places, contains metallic particles. Magnetic dust was found by Mr. Murray, of the *Challenger*, in the dredgings of the sea-bottom. Arago supposes that the dust-falls are like those of the ordinary *aérolites*. Tacchini and Von Lasaul, on the other hand, believe that the so-called cosmic dust is of terrestrial origin. The main argument for the cosmic or extra-terrestrial origin of such dust is the similarity of its composition to that of meteoric stones, though sometimes the dust differs materially from the constituents of an *aérolite*. Again, the fall of both *aérolites* and showers of non-volcanic dust seems generally to be preceded by the appearance of a fireball or luminous meteor. Many of the best authorities

believe that comets are the source of our meteoric phenomena—shooting-stars, fireballs, aërolites, and, if the theory be true, of meteoric or cosmic dust. Meteors seem to be due to the earth passing through rings of matter which revolve round the sun in cometary or elliptic orbits, the larger masses of this matter reaching the earth as aërolites, and the smaller ones being frittered into dust by the resistance of the air. See AEROLITES: METEORS. A contrary opinion is adopted by Prof. Tacchini of the Collegio Romano in Rome, who has analysed the dust which fell in various parts of Italy and Sicily, 1879. The dust was borne on the sirocco from Africa. The examination revealed the presence of the usual constituents—granules of metallic iron, nickel, cobalt, phosphorus, magnesia, etc. Whirlwinds and cyclones in the Sahara, he believes, raise quantities of the dust into the higher regions of the atmosphere; it there remains suspended until transported across the Mediterranean; then a small descending cyclone—the cause of the barometric depression—brings it to the surface of the earth. But no supporter of the terrestrial origin of the dust has explained the fact that the iron particles found in it are particles of meteoric iron as distinguished from any terrestrial iron known to us. **The cosmic origin seems most probable.**

DUST SHOWERS AND BLOOD RAIN, occurring as they do only at long intervals and extending over an immense area of the earth's surface, have heretofore been regarded with consternation and superstitious awe. It is only since Christian Gottfried Ehrenberg, the great scientist, in 1814, turned his attention to the subject and announced his wonderful discoveries to the world, that these showers, occasionally transported by the winds, are known to be infusorial in their character. There are on record accounts of 340 dust and blood showers in all, and of these 81 occurred B.C. and 249 since the Christian era. The first of which we have any knowledge is recorded in Mosaic history, and was inflicted upon the Egyptians. It was called the Plague of Blood, and all the land was covered for three days and three nights. Ehrenberg remarks that these phenomena seem to prevail most frequently within a zone extending from that part of the Atlantic off the west coast of Africa, along in the direction of the Mediterranean sea, reaching a short distance north and continuing east to Asia between the Caspian sea and Persian gulf. This zone has a breadth of about 1800 miles. What is called the Cape de Verd shower in 1834 covered an area of 960,000 to 1,648,000 square miles. A single dust shower, covering about 100,000 square miles of surface, like that in Italy and Sicily in 1803, or the one in Lyons in 1846, would deposit 112,800 weight of dust in a single day, while from the fall of meteorites, between the years 1790 and 1819, it is estimated that only about 600 weight was deposited. The height of this dust-cloud region is supposed to be about 14,000 feet. A simultaneous occurrence of dust showers and meteoric stones has been observed in probably eighteen instances before the Christian era, and fourteen since, making thirty-two in all. By examination, the relative prevalence of different forms and the colors represented lead to the conclusion that these showers are of atmospheric origin and related to the fall of meteorites. The reddish color of the dust, as well as the organic forms, prove conclusively that these showers are not of African origin, particularly as the storm winds and sirocco are found to contain the same species of organism, the whole number of which, as yet known, is 320. There seems to be no longer any doubt that living organisms may develop themselves in the atmosphere, under certain conditions, and not from any ova introduced, but entirely from self-development. During the first great plague of Rome, in the reign of Romulus, Plutarch (q. v.) tells us that it seemed to *rain blood*, an omen which, in ages of barbarism, has been several times recorded. It has been observed in modern times, as well as during the sweating sickness at Cremona in 1529, that the red fungus which causes this appearance has been found to be co-existent with epidermis. The blood spots, as they were called, went for that reason by the name of *signacula*. They were observed in the plagues of the sixth century, and during those of 789 and 959 were called *lepra vestium*. In the plagues of 1500 and 1503 these phenomena caused great alarm, more especially as the sign of the cross would be observed in them. George Agricola was one of the first to look upon these spots in a scientific manner, when in the sixteenth century he pronounced them to be produced by a lichen. Accompanying the occurrence at this time was a remarkable failure of the crops, which is often the result of an abundance of fungæ. See INFUSORIA.

DUST'EE, the largest river of Beloochistan, enters the Arabian sea, in lat. 25° 3' n., and long. 61° 45' east. In proportion to length, it is certainly the least considerable stream in existence. It is about 1000 m. long; and yet it has been found to be, at its mouth, 20 in. deep, and 20 yards wide.

DUSTY-FOOT was a court of summary jurisdiction established at fairs in England for the speedy determination of questions arising between those who resorted to the fair.

DUTCHESS, a co. in s.e. New York, on the e. side of the Hudson river, crossed by the New York Central and Hudson River, the Philadelphia, Reading, and New England, the Poughkeepsie and Eastern, and the West Shore railroads; 853 sq. m.; pop. '90, 77,879. It has a rolling and in some places hilly surface, and the soil is for the most part very fertile. Co. seat, Poughkeepsie.

DUTCH LANGUAGE AND LITERATURE. See NETHERLANDS. Dutch is the written dialect of the inhabitants of the Netherlands. It belongs to the Aryan family of languages and to the Teutonic division thereof. The alphabet consists of the same letters as the English, the vowels having essentially the same sound as in French. In the inflection of the nouns and in the general construction of words and sentences the language strongly resembles the German. The plural of the noun is usually formed by adding *en* or *n* to the singular. The language is characterized by great simplicity, directness, and force, the greater breadth of its inflections giving it some advantage over the English. It has great facilities for the formation of compound words, often a great convenience. In this respect it is superior even to the German. In many instances where the English are compelled in the formation of a technical word to borrow from the Latin or Greek, the Dutch resort to their own indigenous roots. Many nautical terms and phrases in common use among the English are derived from the Dutch. Some specimens of the Dutch language date as far back as the 9th century. They resemble low German, and show that the language had its origin in the same source as all the other Teutonic dialects. It is almost identical with the Flemish, the differences being mainly in orthography and pronunciation. Dutch literature, as distinguished from the Flemish, dates no further back than 1570. It has had, however, a very striking development. Among the distinguished scholars of the nation in the past may be mentioned Erasmus, Grotius, Arminius, Spinoza, and Boërhaave. In the earlier portion of the 17th c., the free commonwealth of Holland was distinguished above every other European nation for its devotion to literature, and it can hardly be said to have fallen much in the rear since that day. The nation has had and still has its eminent poets, historians, travelers, philosophers, scientists, and theologians, whose works have attained a high rank.

DUTCH LIQUID, Ethylene dichloride, is an oily substance obtained by mixing chlorine and olefant gases, which combine together and yield D. L., with the formula $C_2H_4Cl_2$. It has a specific gravity of 1280 (water = 1000), boils at $182.3^\circ F.$ ($83.5^\circ C.$), is not miscible with water, but readily dissolves in ether and alcohol. It possesses the power of producing anæsthesia (q.v.), just as chloroform (q.v.) does; but the great difficulty of preparing D. L. in commercial quantities must retard its employment as an anæsthetic.

DUTCH REFORMED CHURCH. See REFORMED CHURCH IN AMERICA.

DUTCH RUSHES. See *EQUISETUM*.

DUTCH SCHOOL OF PAINTING. This school holds a high and honorable place in the history of art, being marked by many excellences and illustrated by many eminent names. The school took its rise in a divergence from the schools of Germany at the beginning of the 15th century. Its founders were Hubert and Jan van Eyck, who united the majestic simplicity of the ancient Christian type with a close imitation of external nature and a homely strength characteristic of their country. Hubert van Eyck improved the method of painting in oil to such an extent that he is almost entitled to the honor of being its inventor. The altar-piece in St. Bavo, at Ghent, is the work of the brothers van Eyck. In its complete form it consisted of a centre picture of the Worship of the Lamb, surmounted by pictures of God the Father, the Virgin, and St. John, and flanked by folding shutters relating to the principal subject. The parts of this picture—one of the most remarkable productions of modern art—are now separated, the upper and middle portions remaining at Ghent, the others being at Berlin. Two of Hubert van Eyck's most important works are his "Triumph of the Church" in the museum at Madrid, and "St. Jerome" in the gallery at Naples. An admirable specimen of Jan van Eyck's work is a picture of a man and woman in the British national gallery. The influence of these brothers was very extensive. Their pupils were numerous, and of them all, Rogier van der Weyden, who died in 1464, was the most eminent. "The Last Judgment," in the hospital of Beaume, and the "Adoration of the Kings," at Munich, are his. Memling, one of his pupils, was remarkable for the refinement of feeling and the beauty of form displayed in his pictures. Some beautiful specimens of his work are in St. John's hospital, Bruges. "The Last Judgment" in the church of Our Lady, at Dantzic, is probably the best production of his pencil. His influence extended till nearly the end of the 16th century. Quentin Matsys was one of the earliest painters of those homely subjects of which so many examples are found in the Dutch school. His masterpiece, a "Deposition from the Cross," is in the Antwerp museum. Among the portrait painters of the Dutch school in the 16th c., several attained eminence in England. At the beginning of the 17th c. appeared the celebrated Rubens, the herald of a great revival of painting. His forms are gross, but full of life and power. His works are numerous, and specimens are to be found in almost every continental gallery. They may be studied to best advantage at Antwerp, Vienna, and Munich. His "Descent from the Cross," and its companion in the cathedral of Antwerp, are among his best productions. Vandyck, the celebrated portrait painter, was a pupil of Rubens. Some of his best work was done in England. The greatest of the Dutch painters, however, was Rembrandt, whose mastery of light and shade was wonderful, and whose works are now among the most precious treasures of art. His engravings are of equal merit with his paintings. The masters in *genre*, by which is meant the every-day life in art as contrasted with the grandeur of historical

or devotional works, have been numerous in the Netherlands. In this department, Teniers, the elder and the younger, are eminent. Gerard Dow, a pupil of Rembrandt, was also celebrated in this line. Among the most noted marine painters of the Dutch school were Bonaventura Peters and Ludolph Backhuysen. In the 18th c., there was in Flanders and Holland, as well as elsewhere, a decline in the artistic spirit, which was followed in the 19th by a revival.

DUTENS, LOUIS, a French writer, was b. at Tours, 16th Jan., 1730. Being a Protestant, he sought to make his way in England, and occupied himself at first in teaching and in self-improvement. At last, he accompanied the English ambassador to the court of Turin as his secretary, and afterwards remained as *chargé-d'affaires*, a position which he occupied twice subsequently. He held a pension, and was presented to the rich living of Elsdon, in Northumberland; and was likewise made historiographer-royal of Great Britain. He died in 1812. His numerous works display great versatility and knowledge of the world. He undertook the first comprehensive, though not complete, edition of Leibnitz's works (6 vols., Geneva, 1769). In his *Recherches sur l'Origine des Découvertes attribuées aux Modernes* (2 vols., 1766), he rates the knowledge and invention of the ancients by far too high. The *Tocsin* (Rome, 1769), which afterwards appeared under the title of *Appel au Bon Sens* (Lond. 1777), contains some sharp attacks on Voltaire and Rousseau. There is considerable historical interest in his *Histoire de ce qui s'est passé pour le Rétablissement d'une Régence en Angleterre* (Lond. 1789). He also wrote several able treatises on numismatics and other subjects. In the *Considérations Théologiques sur les Moyens de réunir toutes les Eglises Chrétiennes* (Par. 1798), he proposed that a council should compose a confession of faith grounded on the decrees of the councils of the first six centuries. His *Mémoires d'un Voyageur qui se repose* (Par. 1806) met with general favor.

DUTIES. See CUSTOMS.

DUTROCHET, RENÉ JOACHIM HENRI, an eminent French physiologist and physician, was b. at the Château de Néon (Poitou), 14th Nov., 1776, and went to Paris in 1802, to study medicine. His career as a student was brilliant, and in 1808 he was appointed military physician to Joseph Bonaparte, king of Spain. Soon after, he became physician-in-chief of the hospital of Burgos, then devastated by typhus fever. Returning to France in 1809, he gave himself up exclusively to the study of nature, and published a series of works on physics and physiology, full of new ideas. In 1819, he became a correspondent of the royal academy of science; in 1823, of the royal academy of medicine; and in 1831, a member of the former. He died 4th Feb., 1847. The substance of all D.'s investigations and discoveries is contained in his *Mémoires pour servir à l'Histoire Anatomique et Physiologique des Végétaux et des Animaux* (Paris, 1837). He is best known by his researches on the passages of fluids through animal and vegetable substances. The passage of a fluid from without, inwards, he calls *endosmosis*; and from within, outwards, *exosmosis*. These terms have since been widely adopted by physiologists. See DIFFUSION.

DUTTEEAH, or DATIYAH, a principality or raj, having a capital of the same name, is a protected but not tributary state, extending in n. lat. from 25° 32' to 26° 18', and in e. long. from 78° 15' to 78° 54'. The city of D. is situated on a rocky height, and in 1891 had a population of 27,600.

DUTTON, HENRY, LL.D. 1796-1869; b. Conn.; a graduate of Yale, and professor of law in that college. In 1854 he was elected governor of Connecticut; in 1861 he was judge of the superior court of errors. He compiled the statutes of the state, and prepared several digests.

DUTY. See ETHICS.

DUUMVIRS, officers among the Romans appointed for special services, such as magistrates of colonies and towns, constructors and commanders of fleets, and municipal censors. In the eastern empire the people elected for one year *duumviri ludorum*, who were to provide exhibitions of games at their own expense.

DUVAL, CLAUDE, a notorious highwayman, who was born in Domfront, Normandy, France, in 1643, and went to England, as a follower of the Duke of Richmond, at the time of the restoration of Charles II., 1660 (q.v.). He ingratiated himself with the ladies, while he robbed gentlemen of their purses, until he was checked in his career by being captured while he was intoxicated, and was finally hanged at Tyburn, Jan. 21, 1670. His body was buried in the middle aisle of Covent Garden church.

DUVAL, a co. in n.e. Florida, on the Atlantic, intersected by St. John's river, and reached by the Jacksonville, Tampa, and Key West, the Florida Central and Peninsular, and other railroads; about 900 sq. m.; pop. '90, 26,800. The surface is level; chief productions, corn, sugar, and sweet potatoes. Co. seat, Jacksonville.

DUVAL, a co. in s.w. Texas, on the Rio Nueces; 1759 sq. m.; pop. '90, 7598. Stock-raising is the chief business. The Texas and Mexican National railroad intersects it. Co. seat, San Diego.

DUVERGIER DE HAURANNE, JEAN, 1581-1643; a French theologian, native of Bayonne; studied at Louvain, and was fellow-student with Jansen. About 1611, Duver-

gier was made canon at Bayonne. In 1620, he was made abbot of St. Cyran. In Paris he formed a connection with the influential Arnauld family, and, with Angelique Arnauld, directress of the convent of Port Royal, he completely reformed that institution. By taking a leading part in the Jansenist controversy, he excited the enmity of the Jesuits, and at last he was suspected by Richelieu, and thrown into prison in March, 1638. No evidence was found against him, but to break his strong influence he was kept confined until the death of Richelieu. He was then set free, and at once recommenced his war upon the Jesuits; but about six months afterwards died of apoplexy.

DUVERNOY, GEORGES LOUIS, 1777-1855; a French naturalist, invited in 1802 by Cuvier to assist in making the latter's treatise on comparative anatomy. Duvernoy prepared the last three volumes of the work. He practiced medicine for 20 years. In 1827, he was chosen professor of natural history at Strasburg, where he published several papers on anatomical themes. In 1837, he was professor of natural history in the college of France, and in 1850 occupied the chair of comparative anatomy.

DUVEYRIER, HENRI, b. Paris, 1840. He was educated in Germany, and became acquainted with Dr. Barth, the African explorer. He made a trip to Africa in 1857-59, and published *Explorations of the Sahara*. In 1871, he served in the French army, and was for a time a prisoner of war. He d. in 1892.

DUXBURY, a t. in Plymouth co., Mass., on Plymouth harbor, and the New York, New Haven, and Hartford railroad; 30 m. s.e. of Boston. It is the landing-place of the Atlantic cable from Brest, France. Fishing and farming are the leading industries. The town contains the grave of Miles Standish, the Standish monument, and Partridge academy. Pop. '90, 1903.

DUYCKINCK, EVERT AUGUSTUS, 1816-78; b. N. Y.; graduated at Columbia College, 1835; in 1840, editor of *Arcturus*, a monthly magazine; in 1847, he and his brother George started the *Literary World*, and continued it till 1853. In 1856, the brothers finished the *Cyclopedia of American Literature*, an elaborate work in two large volumes, to which, in 1865, Evert added a supplement. Among his publications are *Wit and Wisdom of Sydney Smith*; *Poems relating to the American Revolution*; *History of the War for the Union*; *National Portrait Gallery of Eminent Americans*; *History of the World from the Earliest Period to the Present Time*; and *Memoirs of Francis L. Hawks*.

DUYCKINCK, GEORGE LONG, 1823-63; b. N. Y.; brother of Evert A.; graduate of the University of New York, 1843. Besides his work with his brother, he was the author of *George Herbert of Bemerton*, and of lives of bishop Thomas Ken, Jeremy Taylor, and Latimer.

DUYSE, PRÆDENS VAN, a Belgian writer, was b. in Dendermonde, in Belgium, Sept. 28, 1804. After completing his academical career, he was appointed archivist of his native town, from which he was removed to the same office in Ghent. He soon afterwards received the office of professor of national history in the atheneum, and was made a member of various learned societies both in Belgium and France. He died Nov. 13, 1859. D. was one of the chief contributors to the revival of Flemish literature. As a poet, he was less remarkable for genius than for prodigious fertility; his pieces all bear the stamp of improvisation, of which he was a great master. Several of his productions, both poetical and prose, obtained prizes from literary societies. Of 47 poetical publications issued by D. between 1836 and 1859, we may mention *Vaderlandsche Poëzy*; *Natalia*; *Elegiën*; *Gedichtjes voor Kinderen*; *Het Klaverblad*; and *Nieuwe Kinder-gedichtjes*.

DVOŘÁK, ANTONIN, was b. Sept. 8, 1841, at Muhlhausen in Bohemia. His father was a butcher and desired him to follow the same trade. He studied the violin and the organ, and published in 1873 *The Heirs of the White Mountain*, and subsequently received an annuity from the government. He achieved a reputation in England by his *Stabat Mater*, performed in London in 1883. He came to America 1892 and undertook the directorship of the National Conservatory of Music in New York City, where in 1893 he produced his *New World Symphony* conceived as an expression of the American spirit.

DWALE. See **BELLADONNA**.

DWARF. See **GIANTS AND DWARFS**.

DWARFED TREES, growing in flower-pots, are a characteristic ornament of Chinese and Japanese houses and gardens, and the production of them is an art which has been carried to great perfection. It depends on the prevention of an abundant flow of sap, so that whilst the tree is kept living and healthful, vegetation does not go on with its natural activity. The trees are planted in shallow and narrow flower-pots; care is taken that their roots never pass into the ground beneath; they are very sparingly supplied with water, and their strongest and leading shoots are pinched off.

DWARKA, a small town in India, on the Arabian sea, famous as a resort for Hindoo pilgrims. It is near the western end of the Kathiwar peninsula, and in the territory of the Gaekwar of Baroda.

DWIGHT, EDMUND, 1780-1849; b. Mass. graduated at Yale, and studied law. He was the founder of a firm in Boston which, by establishing great cotton mills, did much toward building up the manufacturing villages of Holyoke and Chicopee. He was

also a leading promoter of normal schools in the state, to the establishment of which he gave a large sum of money.

DWIGHT, HARRISON GRAY OTIS, D.D., 1803-62; b. Mass.; graduated at Hamilton college in 1825; and at once went out under the direction of the American board to assist in the Armenian mission in Turkey, taking a position in Constantinople, where he soon became noted as one of the most zealous and successful workers in the Armenian field. While on a visit to the United States he was killed in an accident on the Troy and Bennington railroad. Among his works are *Researches of Smith and Dwight in Armenia: Memoirs of Mrs. Elizabeth B. Dwight; Christianity Revived in the East; and a Catalogue of Literature in Armenia*.

DWIGHT, JOHN SULLIVAN, b. Boston, 1813; graduated at Harvard, and became a Unitarian minister, in which office he continued about six years. He was one of the Brook Farm experimenters, holding on to the last. Having an excellent musical education, he was engaged by the New York *Tribune* to write a series of criticisms of Jenny Lind's performances, which were the first musical criticisms of any consequence that ever appeared in an American daily journal. Soon after the departure of the songstress he established (in 1852) in Boston *Dwight's Journal of Music*, of which he was editor till 1881. He d. in 1893.

DWIGHT, NATHANIEL, 1770-1831; a brother of Timothy of Yale. He issued the first geography for common schools published in the United States. Among other works by him are *A Compendious History of the Signers of the Declaration of Independence*, and *The Great Question Answered*.

DWIGHT, SERENO EDWARDS, D.D., 1786-1850; a graduate of Yale; at first a lawyer. In 1817, after studying divinity, he became pastor of Park street church, Boston. From 1833 to 1836, he was president of Hamilton college. Among his works are *Life of Jonathan Edwards* (his great-grandfather, whose works he edited), and *The Hebrew Wife*.

DWIGHT, THEODORE, 1764-1846; b. Northampton, Mass.; a lawyer and journalist. His mother was a daughter of Jonathan Edwards. In politics, he was an extreme federalist, and officiated as secretary in the Hartford convention. He was a brilliant writer and speaker, and was in congress, 1806-7. He edited the *Mirror*, Hartford, Conn.; then the *Albany Daily Advertiser*; and started the New York *Daily Advertiser* in 1817, and was its principal editor for eighteen years. Among his works were *Life and Character of Thomas Jefferson*, and *History of the Hartford Convention*.

DWIGHT, THEODORE, 1796-1866; son of the secretary of the Hartford convention; graduated at Yale, 1814; and turned his attention to authorship. Among his works are *Tour in Italy*; *Life of Garibaldi*; *Northern Traveler*; *Tour in New England*; *Father's Book*; *First Lessons in Modern Greek*; *The Roman Republic of 1849*; and *The Kansas War*.

DWIGHT, THEODORE WILLIAM, LL.D., b. N. Y., 1822; graduated at Hamilton college; afterwards studied law, and was professor of that science in Hamilton college, where he started a school of law. From 1858-91 he was professor of law in Columbia college, New York. He has published several works on legal themes, among which are *Trial by Impeachment*; *Argument in the Rose Will and Charity Cases*; besides papers in the *American Law Register*, of which he was assistant editor. In 1868, he became non-resident professor of constitutional law in Cornell university, and, in 1869, lecturer in Amherst college. He acted as member of the N. Y. state constitutional convention in 1867; president of the N. Y. prison association, etc. He died June 29, 1892.

DWIGHT, TIMOTHY, D.D., LL.D., an American theologian, was b. at Northampton, in Massachusetts, May 14, 1752; studied at Yale college, New Haven; and was licensed to preach in 1777. During the war of independence, he was for some time a chaplain in the American army. In 1783, he was ordained minister of Greenfield, in Connecticut, where he also conducted an academy for 12 years with distinguished success. In 1787, the college of Princeton, N. J., conferred on him the degree of D.D.; and in 1795, he was elected president of Yale college and professor of divinity. He died Jan. 11, 1817. D.'s principal work is his *Theology Explained and Defended in a Series of 173 Sermons* (5 vols., Middletown, Conn., 1818, etc.). It has been frequently reprinted in England; and used to be—as probably it still is in quiet country quarters—very popular among elderly persons of a serious turn of mind. D. was not a great or original thinker; but his mind was fertile in the production of respectable ideas, which, though sufficiently commonplace, were yet pleasing both in themselves, and from the important nature of the subjects to which they referred. Among his other writings may be mentioned, *The Conquest of Canaan, an Epic Poem* (1785); *Travels in New England and New York* (1821), reckoned by Southey the most important of his writings; and two volumes of *Sermons* (Edin. 1828).

DWIGHT, TIMOTHY, D.D., b. Norwich, Conn., 1828; grandson of president Timothy D.; was graduated at Yale college, 1849; tutor, 1851-55; became professor of sacred theology in Yale theological school, 1858; member of the American committee for the revision of the Bible, 1873-74; elected president of Yale univ., 1886.

DWIGHT, WILLIAM THEODORE, D.D., 1795-1865; b. Conn.; graduated at Yale, 1813; admitted to the Philadelphia bar, 1821. About 1830 he turned his attention to

theology, studied for the Congregational ministry, and (two years afterwards) became pastor of the Third church, Portland, Me. He published a memoir of his brother, Sereno Edwards Dwight, and a number of reviews and addresses. He was a man of commanding influence as a thinker, writer, and preacher.

DWINA, NORTHERN—as distinguished from the Western Dwina or Düna (q.v.)—an important river of Russia, has its origin in the confluence of the Suchona and the Jug, two streams, the latter more than 200 m., and the former nearly 300 m. in length, rising in the s. of the province of Vologda, and uniting in lat. 60° 45' n., long. 46° 30' east. The D., from the union of these streams, flows n. for about 50 m., and receives the Vytchegda from the e., a river 500 m. long. At this point, the D. becomes navigable, and here it alters its direction, and proceeds n.w. toward the gulf of Archangel, into which it flows, having been joined on the right by the Pinega, and on the left by the Waga, and having traversed a course of about 700 miles. The basin of the D. comprehends an area of 123,900 sq. miles. Its average width is from 500 to 600 ft.

DYADIC ARITHMETIC. Arithmetic in which only two significant figures are used. The same as *binary arithmetic*. (q.v. under **ARITHMETIC**).

DYAKS. See BORNEO.

DYCE, ALEXANDER, an English literary historian, was b. at Edinburgh, 30th June, 1798. He was educated at the high school of that city, and afterwards at Oxford. After officiating for some time as curate, he settled in London in 1827. His literary reputation is chiefly based on his editions of the older English poets and authors—George Peele, Robert Greene, John Webster, Shirley, Thomas Middleton, John Skelton (an author of the beginning of the 16th c., previously little known), Beaumont and Fletcher, Ford, and Marlow, with biographies of the authors, and instructive notices. He also edited the poems of Shakespeare, Pope, Akenside, and Beattie, for Pickering's *Aldine Edition of the Poets*. An old play discovered by him, called *Timon*, and which may possibly have first suggested to the great poet the idea of his drama of the same name, was besides published for the Shakespeare society, as well as another entitled *Sir Thomas More*. In conjunction with Collier, Halliwell, and Wright, he founded the Percy society for the publication of old English ballads, plays, and poems. His ability as a commentator on Shakespeare is proved by his *Complete Edition of the Works of Shakespeare; the Text Revised; with Account of the Life, Plays, and Editions of Shakespeare, Notes, etc.* (1858). He died in 1869.

DYCE, WILLIAM, R.A., a distinguished painter, was b. at Aberdeen in 1806. He was educated at the university there, and at the age of 16 took the degree of master of arts. After acquiring the rudiments of his art-education he went to Rome, where he studied for some years. His tendency at first was very strongly, and continued so under certain modifications, towards early Italian, or pre-Raphaelite art, and his productions attracted the marked attention of Overbeck, the head of the modern German school. On his return to Gt. Britain, he settled in Edinburgh, where, besides painting portraits, he contributed largely to the exhibitions. The first picture he exhibited in Edinburgh was in the Perugino style, and though evincing great power, was at that period, 1829, but little felt or appreciated; his "Puck," however, exhibited at the same time, was very successful, and most of his after-contributions to the exhibitions of the royal Scottish academy, of which he was a member, were deservedly popular, particularly his picture of "Francesca da Rimini," exhibited in 1837. After this he went to London, having been nominated to the head-mastership of the new school of design at Somerset house, an office which he obtained on account of his general acquirements and knowledge of art, and which he held for three years. Soon after this he was appointed professor of painting in the London university. He distinguished himself at the Westminster competition by his frescos, and in consequence was one of the artists selected to decorate the palace of Westminster and the house of lords, and at Osborne house several works in fresco have been executed by him. D. was elected an associate of the royal academy in 1844, and academician in 1848. The following are some of the works he exhibited in the royal academy: "King Joash Shooting the Arrow of Deliverance;" a "Madonna and Child" (1846); a "Meeting of Jacob and Rachel" (1850); "Christabel" (1855); "The Good Shepherd" (1856); "Titian Preparing to make his Essay in Coloring;" "Neptune Assigning to Britannia the Empire of the Sea;" a study for a fresco at Osborne (1857); "St. John Leading Home his Adopted Mother;" "The Man of Sorrows" (1860); and "George Herbert at Bemerton" (1861). He died in 1864.

DYCK, SIR ANTHONY VAN. The history of this celebrated painter is of great interest, not only from the high position he held as an artist, but from his having settled in England, where he executed numerous works, which enable us to realize most of the personages whose actions form prominent points in the history of this country. He was b. at Antwerp, 22d Mar., 1599. His father, according to Houbraken, was a glass-painter; and it is said that his talent was fostered by his mother, who painted landscapes, and was skillful in embroidery. After making very considerable progress under Van Balen, he was, in 1615, admitted as a pupil of Rubens, who was not slow to

appreciate his great talents. In a letter, dated 17th July, 1620, addressed to the earl of Arundel, known historically for his patronage of art, the writer states, "Van Dyck lives with Rubens, and his works are beginning to be esteemed little less than those of his master. He is a young man of one-and-twenty, whose parents are persons of considerable property, and it will be difficult, therefore, to induce him to remove." Soon after this—namely, in 1621—by advice of Rubens, he visited Italy. The works of the great Venetians were the first to attract his attention. After leaving Venice, Genoa was the next city he resided in, then Rome, and he went a second time to Genoa, from whence he made a short visit to Palermo. Van Dyck was five years in Italy, and from the number of portraits painted by him in Genoa—many of the best of his works in his Italian manner are still there—he must have lived a considerable portion of the time in that city. On his return to Antwerp, in 1626, he executed various pictures for churches, and the portraits classed among those painted in his Flemish style; the series of cabinet portraits of the painters of his day, engraved by Vostermans, etc., and most of which are now in the possession of the duke of Buccleuch, were also painted at this time. It is stated that, about 1630–31, Van Dyck visited England, and, meeting with no encouragement, remained only a short time; however, there is no satisfactory proof of this. But in 1632, he went to England, by invitation of the earl of Arundel, at the command of Charles I. He was lodged at Blackfriars, was soon afterwards knighted, and had a pension of £200 a year settled on him. His commissions were now numerous, he was enabled to live in great style, entertained people of high rank, and had a country-house at Eltham, in Kent. His wife, Marie Ruthven, by whom he had one daughter, was the daughter of Patrick Ruthven, physician, fifth son of lord Gowrie. Van Dyck died in London in 1641, leaving property to the amount, it is said, of about £20,000. Only 20 years are included within the time when Van Dyck left the studio of Rubens till the period of his death; and during that short career, the number of pictures executed by him, on what is thought to be good authority, seems almost incredible, for in Smith's Catalogue Raisonné of the Works of the Dutch and Flemish Painters, there are descriptions and interesting particulars of upwards of 950. This artist's works may be classed as executed in three distinctly marked styles: 1. Those painted in Italy during his residence of five years, from 1621 till 1626; these are distinguished by deep tone and color, and dignity of character and expression. The portraits of the "Lomellini Family" and an "Italian Nobleman," in the Scottish national gallery, are good examples of his style at this period. 2. His productions between 1626 and 1631, when he lived in Flanders, are known as done in his Flemish style; these works are executed with much *impasto* or body of color in the lights, and transparency in the shadows. Perhaps it was during this period of his career that he executed his finest works, among which the best are the portrait of Snyder the painter, now the property of the earl of Carlisle; the companion-picture of Snyder's wife, now belonging to the earl of Warwick; and the portraits of Philip le Roy and of his wife Mme. le Roy, purchased by the marquis of Hertford at the sale of the king of Holland's pictures. 3. The portraits he painted in England between 1631 and 1641; these are noted for grace and elegance, but many of them were often slight in execution, or done partly by assistants. Van Dyck's biographers and critics generally dwell at great length on his Scripture subjects, and express regret that he devoted so much of his time to portrait-painting; but different notions seem to be now gaining ground. No Scripture subjects by Rubens or Van Dyck, or produced in any of the later schools, will stand comparison, for purity of feeling and appropriate technical execution, with the works of the earlier masters; and the allegorical pieces so much in vogue in the 17th c., are little in accordance with the ideas of the present time. But the portraits by Van Dyck are all interesting and valuable histories, recorded with marvelous truth and vividness, of characters who played important parts in an era noted for great events—and as works of art will rank with the productions of the best schools. See illus., *CORREGGIO, ETC.*, vol. IV.

Van Dyck's etchings are admirable. Several of the portraits in the collection of portraits of artists, are etched by him. The impressions of those that were thrown off, when the heads merely were etched, are of great value; indeed, in expression and spirit, they are unequalled. See Carpenter's *Memoir* (1844).

DYEING is the art of staining or coloring textile fibers. It has been practiced among eastern nations from time immemorial; and in the sacred writings, we read of the vestments of the high-priest being dyed purple, of linen cloths being dyed blue, purple, and scarlet, and of rams' skins being dyed red. The famous Tyrian purple is believed to have been discovered by an inhabitant of Tyre fifteen hundred years B.C.; and immediately afterwards the Tyrian purple became the badge of royalty, and cloth dyed with it commanded a princely price. The Egyptians, Greeks, and Romans practiced the art of dyeing; and gradually it became more and more wide-spread as civilization advanced, the discovery of America and other lands materially increasing the number of dye-stuffs. Dyeing differs from painting in that the colors are fixed within the substance of fiber and not merely attached to the surface. The staining of wood is comparable to the dyeing. The production of a colored pattern upon woven fabric constitutes a separate branch of dyeing, and is described under calico-printing.

The coloring-matters used in dyeing are obtained from the animal and vegetable

kingdoms, or are made artificially. See DYE-STUFFS. With respect to their behavior toward the material to be dyed, dyestuffs may be divided into 2 classes. (1) A natural affinity appears to exist between the fiber and the coloring-matter, such that by simple immersion, the material at once absorbs the coloring-matter from its solution. The fiber is then said to be *substantively* dyed, and the color is called a *substantive* color for that particular fiber. Most of the coal-tar colors are substantive toward silk and wool and a few toward cotton. (2) The coloring-matter has no attraction directly for the fiber, but it readily combines with another substance, called a *mordant*, with which the fiber has been previously charged. Such colors are called *adjective* colors. Generally speaking, a substantive dyestuff has a particular color of its own, and, unmixed with another dyestuff, can produce upon the fiber only that one color in light or dark shades. As a rule, the color of the dyed fabric is the same as that of the solution of the dyestuff. On the other hand, an adjective dyestuff, if it has an original tint of its own, is not an essential feature, since the colors produced on the material depend chiefly upon the particular mordant used. For instance: Madder dyes material mordanted with alumina salts pinks and reds, with iron salts violets and blacks; and logwood with alumina salts gives violets, and with iron or chromium salts blacks. Thus it is seen that if the madder and logwood, or the principles contained in them, have colors of their own, this has little to do with the colors they form with various metallic salts. Mordants, therefore, not only fix the dye, rendering it fast and permanent, but they also determine the shade produced, as well as the brightness of it.

Mordants may be defined as substances which are easily fixed within the fibers and which readily combine with the coloring-matters to form insoluble compounds. The following examples will suffice to show the mode of applying some of the more important metallic mordants. Iron, alumina, and chromium salts may be fixed in textile fibers in several ways. By boiling the material in a solution of alumina, iron, or chromium acetate, acetic acid is evolved and an insoluble basic salt of alumina, iron or chromium is precipitated in the fiber. The same result may be attained by impregnating the fiber with one of these acetates and then steaming. This is done in calico-printing. Saturating the fiber with a soluble salt of iron, alumina, or chromium and then immersing it in an alkaline bath, fixes the hydrates of iron, alumina, or chromium, as the case may be. Oxide of tin is fixed by boiling the fiber in chloride of tin. Immersion in a solution of stannate of soda followed by one in tannin fixes tannate of tin. Silk and wool are mordanted with alum by simple immersion in the aqueous solution of it, when they absorb a considerable quantity. Alumina acetate is called by the dyer *red liquor*, iron acetate *black liquor*, and chloride of tin *red spirits*, on account of the colors they produce with certain natural dyes. The mordants so far described are basic, and naturally they have the greatest affinity for dyes with acid properties, such as madder (alizarine), logwood, fustic, Brazil-wood, and cochineal. Tannic acid is readily absorbed by the different fibers, and it serves to fix, on cotton particularly, dyes which are basic, such as rosaniline, malachite green, and other coal-tar dyes. It forms with such colors insoluble tannates in the fiber. Another class of mordants includes gelatine, albumen, and caseine. These serve to animalize, as it were, vegetable fibers. Cotton treated with albumen, for instance, behaves like an animal fiber and may then be dyed substantively with colors which otherwise would have no affinity for it. In some cases, however, these mordants act more like adhesives than true chemical fixing agents. They are better suited for calico-printing than for dyeing.

The fibers usually dyed are silk, wool, and cotton. Occasionally the material is dyed before spinning, but more frequently in the state of yarn or thread, and sometimes as woven cloth. Before the fibers are fit for the dyeing operations they must first undergo a cleansing process, the object of which is the complete removal from the fiber of all natural and artificial impurities, such as grease and dirt, as these would prevent the proper attachment of the mordant and color and produce spots or uneven shades. Bleaching is also necessary whenever light and delicate tints are to be dyed. Wool is cleansed by first washing, then steeping in soap and carbonate of soda and finally rinsing well with water. Thus is removed the natural grease of the wool. Wool is bleached by means of sulphur dioxide. Silk is cleansed in order to remove from the surface of the fiber the natural silk glue which envelops it. This is done by boiling the silk twice in soap. The liquor in which the silk was boiled last is called "boiled-off liquor," and is made use of in subsequent dyeing operations. Silk is bleached, like wool, with sulphur dioxide. Cotton is cleaned and bleached in the following way: First, a "lye boil" in weak caustic soda, then rinsed; second, "chemicking," or steeping in a solution of bleaching powder; then rinsed again; third, "souring," or steeping in dilute sulphuric acid; fourth, thorough rinsing in a washing-machine, and finally drying. For the cleaning and bleaching of cotton cloth see CALICO-PRINTING.

The operation of dyeing with the substantive colors is very easy. Simple immersion of the goods in the hot dye-bath and carefully working them beneath the surface to secure an even shade is all that is necessary. The dye-bath should be clear and free from suspended impurities, the particles of which might attach themselves to the fiber and produce spots. The full quantity of the dye is seldom added all at once to the bath, but successive portions, previously dissolved, are poured in from time to time as the dyeing proceeds, until the desired shade is obtained; the temperature of the bath is in the mean

time gradually raised. The animal fibers have such an affinity for some of the coal-tar colors that they absorb them completely, leaving the dye-bath almost colorless. Most of the aniline colors are dyed in neutral baths. Aniline blue, however, is usually dyed in an alkaline bath and some of the azo colors are dyed in acid baths. Silk is often dyed in a bath containing a little soap or some of the "boiled-off liquor" previously referred to. Very few dyes are substantive toward cotton. Safflower is dyed on cotton in a neutral bath. Alkali blue is dyed in a faintly alkaline bath and the full color subsequently developed by immersing the cotton in weak sulphuric acid. Indigo is another substantive color for cotton. The dyeing with adjective colors is usually preceded by the operation of mordanting. After the mordant has been applied, the goods are wrung out or rinsed, according to circumstances, and then immersed in the dye-bath, and the dyeing proceeded with as for substantive colors. In some cases, notably with certain colors produced with logwood and cochineal, the mordant and the dye are applied simultaneously in the same bath. The dyeing with pigment colors consists in treating the material successively with the chemical reagents necessary for the formation of colored inorganic precipitates within the substance of the fiber. The following are a few of the methods of dyeing. For further details see *Silk Dyeing, Printing and Finishing*, by Hurst, and *Dyeing of Textile Fabrics*, by Hummel.

DYEING OF WOOL. *Reds.* (1) Mordant the wool with alum and potassium bichromate and dye in a decoction of peach-wood or Brazil-wood. (2) Mordant with tartar and red spirits and then dye in decoction of ground cochineal. This gives a scarlet. (3) Aniline red (magenta) is dyed in a neutral bath. (4) Roccelline and the azo scarlets are dyed in a bath slightly acidulated with sulphuric acid. *Oranges.* (5) The best orange dyes are found among the coal-tar colors. Methyl orange, naphthol orange, and orange yellow are best dyed in acid baths. *Yellows.* (6) Mordant the wool with alum and dye with weld. This gives an olive yellow. (7) Mordanting with stannic chloride and dyeing with quercitron gives a buff yellow. (8) Using stannous chloride for mordant and dyeing with Persian berries gives a full rich yellow. (9) Turmeric may be dyed without any mordant, but alum is commonly used. (10) Aniline yellow and Martin's yellow may be dyed in neutral baths, while (11) acid yellow and the tropæolins require acid baths. *Greens.* (12) Mordant with alum and dye yellow with fustic. Then dye blue over it in indigo-vat. (13) Mordant with sodium hyposulphite and dilute sulphuric acid and then dye with methyl green or malachite green. (14) First dye the wool blue with indigo extract and then top with picric acid. *Blues.* (15) Dye in indigo-vat. (16) Dye with alkali blue in alkaline bath with borax, and develop the color by immersion in dilute sulphuric acid. (17) Methylene blue is dyed in a neutral bath. (18) Prussian blue. Impregnate the wool first with copperas, then pass through an alkaline bath, rinse, and immerse in yellow prussiate of potash. *Lilacs, Purples, and Violets.* These are frequently compound colors. (19) Mordant with tin spirits or alum and dye in a decoction of logwood. (20) The different methyl violets are dyed in a neutral bath. (21) The indulines are dyed like alkali blue. *Blacks.* (22) By mordanting the wool with potassium bichromate, copperas, or iron liquor, and dyeing in a decoction of logwood, with or without addition of fustic, various shades of black are produced. Sometimes the wool is first dyed blue in the indigo-vat and then with logwood as above. The result is a blue black.

DYEING OF SILK. *Reds.* (1) Mordant the silk with alum and dye with Brazil-wood. (2) Silk is dyed bright pink in a decoction of safflower. (3) Mordant with red spirits and tartar and dye crimson with peach-wood. Vary the shade by adding fustic, annatto, or cochineal. (4) For cochineal crimson mordant with alum and dye with cochineal decoction. For scarlet, mordant with nitro-muriate of tin. (5) Aniline red (magenta), safranin (pink), magdala red, and the eosines are dyed on silk in a weak soap bath. *Yellows.* (6) Mordant with alum and dye with weld. (7) Addition of annatto or turmeric to the preceding gives an orange shade. (8) Picric acid is dyed substantively. (9) Martin's yellow, aniline yellow, methyl orange, and tropæolin are dyed in weak soap baths, sometimes acidulated. *Greens.* (10) Dye blue with indigo extract, then mordant with alum and dye with fustic; or (11) dye blue, as in (10), and top with picric acid. (12) Methyl green is dyed in a warm soap bath, with or without picric acid. (13) Malachite green is dyed in a soap bath acidulated with acetic acid. *Blues.* (14) Prussian blue. Work the silk in iron liquor; rinse; then boil in soap and rinse again; now dye in bath of yellow prussiate of potash. (15) Dye direct with indigo carmine in a slightly acid bath. (16) Aniline blues and the indulines are dyed in baths containing some "boiled-off liquor." (17) Methyl violets are dyed in weak soap baths. *Blacks.* (18) Silk is usually dyed black with logwood, using iron salts as a mordant. The process is complicated. (19) *Browns, Grays, and Lilacs* are usually compound colors.

DYEING OF COTTON. *Reds.* (1) Mordant with tannin and basic alumina sulphate and then dye with Brazil-wood. This gives a bluish red; (2) or mordanting with tannin and red spirits and dyeing with Brazil-wood gives scarlet. (3) The most important red on cotton is Turkey red (q.v.). It is now produced entirely with artificial alizarine instead of madder. (4) Aniline red and safranin are dyed on cotton by first mordanting with tannin and tartar emetic. (5) For dyeing eosines the cotton is prepared with olive oil and alumina acetate. (6) The azo scarlets are dyed on cotton mordanted with stannate of soda and alum. (7) Congo red is one of the few coal-tar colors which are substantive for

cotton. *Yellows.* (8) Chrome yellow. Steep the cotton in acetate of lead, then immerse in potassium bichromate. The color may be deepened by subsequently boiling in lime water. (9) Weld on cotton gives with alumina mordants yellow and with chromium mordants olive colors. (10) Fustic is dyed in the same manner as weld. (11) Mordant with tin spirits and dye with quercitron. This gives a buff yellow. (12) Turmeric dyes cotton without a mordant. (13) For chrysoidin the cotton is mordanted with tannin and tartar emetic. (14) Tropæolins, orange yellow, and some other yellow coal-tar dyes require the cotton to be prepared with olive oil and alumina acetate. *Greens.* (15) First dye blue with indigo and then yellow with fustic and quercitron. (16) Mordant with tannin and dye with methyl green. (17) Mordant with tannin and tartar emetic and dye with malachite green. (18) Modify these greens by topping them with picric acid. *Blues.* (19) Prussian blue, as for wool. (20) Indigo—see separate article. (21) Methylene blue is fixed by tannin, and (22) aniline blues by tannin and tartar emetic. *Blacks.* (23) Logwood blacks are obtained on cotton by mordanting with coppers or iron liquor and then dyeing in a decoction of logwood. (24) Aniline black. The production of this black on cotton fiber is described under DYE-STUFFS.

The dyeing of mixed cotton and woolen fabrics, such as cashmeres and delaines, requires special attention. Sometimes the material is treated in such a way that the wool is dyed first, according to the methods customary for wool. After washing, it is dyed again in baths made up with a view to dyeing only the cotton. Or, as is generally the case, the two operations are combined, and the material is impregnated with mordants and dyed with colors selected with reference to dyeing the wool and the cotton at the same time. The object, of course, is to make the colors of the wool and the cotton as nearly alike as possible. Sometimes, however, the wool is purposely dyed one color and the cotton another, thus producing the effect obtained by dyeing the fibers separately before weaving. Much judgment is necessary in dyeing mixed fabrics.

A few words are in place regarding the permanency of dyed colors. The term "fast" is a comparative one and needs qualification. It is obvious that the colors ought to withstand every condition to which the materials dyed with them are likely to be subjected when in use. The colors on woolen goods and calicoes, intended to be worn daily, should be much more fast against the action of air and sunlight than the delicate colors on silks, which are less exposed. Cotton and woolen fabrics are washed much more frequently than silks, and on this account the colors with which they are dyed should be fast against soap and alkalis. Colors dyed upon fabrics intended for wearing apparel should be fast against the action of the acids contained in the perspiration. Many coal-tar colors are not fast to light, and few can withstand repeated washing with soap. All organic colors are bleached by chlorine, and some by sulphurous acid. Few general statements can be made as to which colors are fast and which are not. The fastest reds are those produced with madder or alizarine—Turkey red, for instance; cochineal reds are fairly permanent. Chrome yellow, iron buff, alizarine orange, and some tropæolins may be called fast colors. Fast greens are cœrulein and Persian berries dyed on a copper mordant. Indigo, alizarine blue, and Prussian blue are fast. Alizarine and gallein yield fast violet colors. The fastest blacks are aniline black and those produced with alizarine. The permanency of logwood blacks depends upon the particular mordants used.

DYER, a co. in w. Tennessee, on the Mississippi; 495 sq.m.; pop. 90, 19,878. Soil rich, surface level, with extensive forests of white oak, walnut, poplar, etc. Corn, cotton, lumber, and tobacco are the chief products. Co. seat, Dyersburg.

DYER, ALEXANDER B., 1817-74; b. Va.; graduated at West Point, 1837. In 1864, he was appointed chief of ordnance with the rank of brig.gen. He served in the Florida war in 1837-38; in various arsenals, 1838-46; in the war with Mexico, 1846-48; in various arsenals, 1848-61; and in the ordnance board, 1859. He had charge of the Springfield armory, 1861-64, and served in the ordnance board, 1860-63, and as chief of ordnance in the ordnance bureau in Washington, from 1865 to his death.

DYER, GEORGE, 1755-1841; b. London; antiquary, scholar, and poet; educated at Emanuel coll., Cambridge. From 1774-88 he was engaged, chiefly at Cambridge, as usher, tutor, and as minister (in the Baptist denomination), but he finally settled in London in 1792. He pub. *History of the University and Colleges of Cambridge* (Lond., 1814), and many other works.

DYER, Rev. JOHN, an English poet, was b. at Aberglasney, in Caermarthenshire, in the year 1700, and educated at Westminster school. He was intended for the law, but, however, abandoned that study for painting. In 1727, he published his poem of *Grongar Hill*, remarkable for simplicity, warmth of feeling, and exquisite descriptions of nature. He then made the tour of Italy, and returning home in bad health, took orders, and obtained some respectable ecclesiastical preferment. In his didactic poem, entitled *The Fleece* (1754), the difficult subject is treated with great success; but the unpretending tone of the poem made no impression upon his contemporaries. Another poem, *The Ruins of Rome* (1740), abounds in isolated beauties. D. died in 1758. A collected edition of his poems appeared in 1761.

DYER, MARY, one of the victims of the persecution that befell the Quakers in the early years of the Massachusetts colony. Their uncompromising attack on the organiza-

tion of both the church and the civil state, led to the enactment by the legislature of a law of banishment against them under penalty of death if they should return. Mary Dyer left the colony for a time, but soon returned, when she was arrested and convicted, but on being led forth to execution was reprieved, and, against her will, conveyed out of the colony. Returning again, she was hanged on Boston common, June 1, 1660.

DYERS' BROOM, or **WOADWAXEN** (*genista tinctoria*), a leguminous shrub of European origin bearing yellow flowers and simple leaves, and said to be the bush genet, from which the Plantagenet family took its name. It is used in Russia for preventing hydrophobia; and formerly in this country its tops were domestically used for a yellow dye, and it was extensively cultivated in New England. Its medicinal value appears to be small.

DYERS' WEED, or **ROCKET** (*reseda luteola*), a European herb, naturalized in the region of New York, resembling the mignonette. It was formerly used for medicinal purposes, but is now valued chiefly as material for a yellow dye, for which purpose it is largely cultivated in some parts of Europe.

DYE-STUFFS. This title is generally applied to all the materials used by the dyer for the production of colors on textile fibers. In its more restricted sense it indicates only those substances which are themselves the real coloring matters, and does not include those which are assistants merely, and only serve to fasten the color to the fiber. The latter class of substances, called *mordants*, are considered in the article on **DYEING**.

Coloring matters are natural or artificial, according as they are derived from plants and animals, or are the product of chemical manufacture.

VEGETABLE COLORS.—These are procured from plants of widely different natural families. They are also found in all the different parts of plants. Indigo and archil are obtained from the whole plant; madder, alkanet, and turmeric from the roots; logwood, brazil-wood, and fustic from the wood; quercitron from the bark; safflower from the petals; saffron from the anthers; Persian berries and annatto from the seed. Many coloring matters in the state in which they exist in the plant give little or no indication of their tinctorial power, but by fermentation, oxidation, or other chemical agency they yield dyes of great brilliancy. Thus the indigo plant gives no evidence that it will yield a blue dye until it is fermented, when the indican, which it contains, is split up into indigo and indigluclin. A few vegetable colors, such as saffron and safflower, are found ready formed in the plant. Most vegetable colors require the use of other chemical agents to fix them to the fiber. Some of these agents are simply astringent, like sumach or tannin; while others, like sulphate of iron, appear to combine with the coloring matter and form definite chemical compounds in the fiber. Many vegetable colors fade or change by air and light. All organic colors are bleached by chlorine and many by sulphurous acid. Vegetable dyestuffs are generally found in commerce as the dried and coarsely powdered natural substance. A few, such as logwood, brazil-wood, fustic, quercitron, and madder, are sold as "extracts," i.e., concentrated aqueous solutions of the useful portions of the plant. The vegetable colors are numerous, but few are useful.

RED COLORS.—*Madder* is the most important of this class. It is the root of the *rubia tinctoria*; alizarine and purpurine are the valuable constituents. Artificial alizarine has now almost entirely displaced madder in dyeing and printing. *Munjeet*, or *Indian madder*, is used in India instead of madder. *Brazil-wood*, obtained from the *caesalpinia echinata*, contains brazilin, $C_{16}H_{14}O_6$. *Cumwood* and *barwood* are very similar to brazil-wood. *Sandal-wood*, from the *pterocarpus santalinus*, of India, owes its dyeing properties to the santalin, $C_{15}H_{14}O_6$, which it contains. *Safflower*, the dried flowers of *carthamus tinctorius*, contains carthamin, $C_{14}H_{16}O_7$. It dyes silk and cotton without a mordant. *Annatto* is the seed of *bixa orellana*. The tinctorial constituent is bixin, $C_{28}H_{34}O_5$. *Archil*, *Cudbear*, and *Litmus* are obtained from the sea-weed *rocceella tinctoria*. The coloring matters do not exist in the weed ready-formed, but are developed by exposing it to the action of ammonia, air, and moisture. They are used chiefly for dyeing silk. *Alkanet* is the root of *anchusa tinctoria*; its coloring matter is alkanin, $C_{15}H_{14}O_4$.

YELLOW COLORS.—Yellow is the most abundant color in the vegetable world. *Berry root*, imported from the East Indies, owes its dyeing property to berberine, $C_{10}H_{17}NO_4$. *Fustic*, or *yellow-wood*, the heart-wood of *morus tinctoria*, is seldom used alone in dyeing. Generally it is mixed with other colors to produce drabs, olives, etc. *Quercitron*, the bark of *quercus tinctoria*, yields a rich orange yellow dye (see **BUCKTHORN**), which gives useful mixed shades. It contains quercitrin, $C_{36}H_{38}O_{20}$. *Persian berries*, obtained from *rhamnus cathartica*, yield a deep yellow color. *Saffron*, from the flowers of the *crocus sativus*, of southern Europe; *Aloes*, from the sap of the *aloë sinuata*, of the East Indies; *Weld*, the entire plant of *reseda luteola*, cultivated in Europe; and *Turmeric*, the root of *curcuma tinctoria*, of China, are all useful yellow dyestuffs.

GREEN COLORS.—There are very few of these, most green shades being obtained by mixtures of blue with yellow dyes. *Lo-Kao*, or *Chinese green*, prepared by the Chinese from the entire plants *rhamnus utilis* and *r. chlorophorus*, is very scarce and expensive. *Chlorophyll*, the green coloring matter of plants in general, and *Sap green*, from the berries of *rhamnus catharticus*, are fugitive colors.

BLUE COLORS.—*Indigo* (q.v.) is the most important of these. It is prepared from *indigofera tinctoria*, and the entire plant is used. *Woad* is the *isatis tinctoria* of India.

and is extensively used as an addition to the indigo vat. *Logwood*, or *Blue-wood*, comes from the tree *hæmatoxylin campechianum*. The active principle in it is hæmatoxylin, $C_{16}H_{14}O_6$. It gives, with alumina mordants, blue, and with iron mordants, blue-black colors. Violets, browns, drabs, olives, and blacks are compound colors produced by mixing two or more vegetable dyestuffs.

ANIMAL COLORS.—The chief animal dyes now in use are : *Cochineal* (q.v.), the product of the insect *coccus cacti*, cultivated in Mexico; *Kermes* (q.v.), that of the insect *coccus ilicis*; and *Lac dye* (q.v.), obtained from a resin colored by the insect *coccus lacæ*. The tinctorial principle contained in these three is carminic acid, $C_{17}H_{15}O_{10}$. The *Tyrian Purple* of the ancients is believed to have been obtained from a mollusk.

MINERAL COLORS are insoluble metallic compounds developed within the textile fibers by the successive application of suitable chemical reagents; or, they may be previously prepared and then fixed to the fiber by an adhesive. They are not true dyes, but pigments (q.v. under PAINTS). *Chrome yellow* or *Chromate of lead*, *Prussian blue*, *Iron buff* or *Ferric oxide*, and *Bistre* or *Manganese oxide* belong to the first class, while *Ultramarine*, *Chrome green*, and *Vermilion* belong to the second. Mineral colors are more suitable for calico-printing than for dyeing. More detailed information regarding most of the dyestuffs mentioned under vegetable, animal, and mineral colors will be found under their respective names.

COAL-TAR COLORS.—Within the last 20 years modern chemistry has furnished the dyer with many beautiful colors prepared from materials extracted from the refuse tar produced by the distillation of bituminous coal in the manufacture of illuminating gas. These colors are generally produced in aqueous solution and precipitated therefrom in a pulverulent or crystalline state by the addition of common salt. When filtered out, washed and dried, they are ready for the market. The coal-tar colors are usually soluble in water. They possess a natural affinity for animal fibers, and the shades produced upon silk and wool are particularly brilliant. Coal-tar colors are not classified according to their tinctorial power or the shades they produce. A classification founded strictly upon their chemical constitution is of interest only to the theoretical chemist, and would be out of place here. The following arrangement has the advantage of simplicity :

I. ANILINE COLORS.—The most important of this class is *Rosaniline*, also called *Fuchsine* or *Magenta*. It is prepared by heating a mixture of aniline and toluidine with arsenic acid. The color is a base, and is sold as the hydrochloride or acetate. It dyes silk and wool a magenta shade. *Methyl violet* or *Paris violet* is prepared by heating together dimethylaniline, copper nitrate, common salt, and acetic acid. It is a very beautiful and useful color. It dyes wool and silk in a neutral bath. If methyl violet is heated with methyl chloride the product is *Methyl green*, a color chiefly used for dyeing silk. *Aniline blue*.—In order to prepare this the best quality of magenta is heated in a retort, with a large excess of aniline. Being soluble in alcohol it is sold as *spirit blue*, and is useful only for silk. When spirit blue is heated to $35^{\circ} C.$, with sulphuric acid, the result is *Alkali blue*. This color is dyed on wool and silk in an alkaline bath and the color subsequently developed by immersing the material in dilute acid. In the treatment of spirit blue with sulphuric acid, if the temperature is raised to $110^{\circ} C.$, *Water blue* or *Cotton blue* results. This color is soluble in water and is chiefly applied to cotton. *Benzaldehyde green* or *Malachite green*.—Benzaldehyde and dimethylaniline are heated together with zinc chloride, and the resulting compound is oxidized by manganese dioxide. The commercial article is a double zinc salt. *Chrysaniline* or *Phosphine* is an orange dyestuff extracted from the residues of the manufacture of magenta. Its application is limited to silk and woollen printing. *Mauve* or *Perkin's violet* is produced by the oxidation of aniline with chromic acid. As a dyestuff it is obsolete. By heating aniline with amido-azo-benzol, *Induline* is formed. This dyes silk and wool various shades, ranging from blue-gray to blue-black. It is applied like alkali blue. *Safranine* is prepared by passing nitrous acid into a mixture of aniline and toluidine, adding more toluidine and then oxidizing the mixture with chromic acid. *Safranine is chiefly used for silk, which it dyes a beautiful pink. *Aniline black* is only suitable for cotton dyeing and calico-printing. It is usually produced when wanted directly upon the fiber. The cotton yarn is worked in a bath of aniline, hydrochloric acid, and potassium bichromate. The material turns first green and then black from the formation within its fibers of aniline black. Cotton cloth is printed with a thickened mixture of aniline hydrochloride, chlorate of potash, and sulphide of copper, and then hung up in a warm moist atmosphere. The black is formed wherever the mixture was printed. Aniline black is very intense and permanent. *Methylene blue*.—This color contains sulphur. It is only used for wool and cotton, on which it produces shades similar to indigo. Methylene blue is extensively used in calico-printing. *Magdala red* or *Naphthalene red*.—This magnificent color is obtained from naphthylamine in the same manner as induline is prepared from aniline. It is the hydrochloride of a base, and its composition is $C_{20}H_{20}N_4 \cdot HCl$. It is used only for dyeing silk, to which it imparts a beautiful pink color with a strong fluorescence.

II. NITRO COLORS.—*Picric acid* or *carbazotic acid* (q.v.), formed by treating phenol with nitric acid, dyes silk and wool a light greenish yellow. It is not fast, and is poisonous. *Victoria yellow*, from cresol and nitric acid, dyes silk and wool yellow, with a slight cast of orange. *Martius yellow*, from α naphthol, sulphuric and nitric acids, dyes wool and silk a full golden yellow, but the color is fugitive. *Aurantia*, from

diphenylamine and nitric acid, dyes silk and wool orange yellow. *Naphthol yellow S*, is a sulphuric acid of Martius yellow, and is prepared indirectly. It is used for silk and wool, and is permanent.

III. AURINE COLORS.—To prepare these, phenol is heated for some time with oxalic and sulphuric acid. The product is *yellow coralline*. This yellow coralline, on being heated with strong ammonia, is converted into the *Red coralline* or *Peonine*. These colors are "spirit soluble" if in the pure state, and "water soluble" if sold as alkali salts. They are not used for dyeing, but for printing on wool and silk, the color being fixed with albumen. *Rosolic acid* is prepared from magenta by treating it with nitrous acid in aqueous solution. The colors of this class are now only of secondary importance.

IV. PHTHALIC ACID COLORS—PHTHALEINS.—*Fluorescein*, prepared by heating phthalic acid with resorcin, is the first of this class. The solution of fluorescein in alkaline water is light yellow, but it has a magnificent green fluorescence. *Fluorescein*, when treated with bromine, gives the tetrabromine derivative known as *Eosine*; when treated with iodine, it forms the tetraiodine compound called *Erythrosine*. *Aureosine* is a chlorinated fluorescein, while *Safrosine* is a nitro-derivative. *Rose Bengale* is a dichlor-tetraiodo compound of fluorescein. All these dye silk and wool various shades of pink, which are extremely beautiful and delicate. They are easily applied and fairly permanent. *Gallein* is formed by the action of phthalic acid on pyrogallic acid, while *Cærulein* is made from gallein by treatment with sulphuric acid. *Gallein* and *cærulein* are only used for printing calico, on which the former gives violet shades and the latter olive green.

V. AZO COLORS.—The dyestuffs in this class are all produced by the aid of nitrous acid. They may be subdivided into three groups: (1) The nitrous acid acts on a base, such as aniline, and the resulting compound is at once combined with the same or another similar base. Thus aniline, treated with nitrous acid and then with more aniline, gives *Aniline yellow*; or, if treated with phenylene diamine instead of more aniline, the result is *Chrysoidine* (orange). If phenylene diamine alone be treated with nitrous acid *Bismarck brown* is formed. (2) The nitrous acid acts on the sulphonic acid of aniline, and then a base is added. Thus are produced, with aniline as the base, *Fast yellow*; with dimethylaniline, *Methyl orange*; and with diphenylamine, *Tropæolin orange*. (3) The nitrous acid acts on the sulphonic acid of a base, and the compound so formed is combined with a phenol. Thus are obtained *Tropæolin yellow*, *Chrysolin*, *Naphthol orange*, *Orange yellow*, *Xylidine ponceau*, *Roccelline*, *Biebrich scarlet*, *Congo red*, and innumerable others. The azo dyes are useful permanent colors.

VI. ARTIFICIAL INDIGO.—The synthesis of indigo was accomplished by Baeyer in 1880. His success was the result of long study and painstaking labor. In brief, his process is as follows: Benzaldehyde is treated with sodium acetate; the result is cinnamic acid, $C_6H_5 \cdot CH:CH \cdot COOH$. Nitric acid converts this into ortho-nitro-cinnamic acid, $C_6H_4(NO_2) \cdot CH:CH \cdot COOH$. Bromine, acting on this, forms ortho-nitro-cinnamic acid dibromide, $C_6H_4(NO_2)CHBr \cdot CHBr \cdot COOH$. Caustic potash is now added, and there is formed ortho-nitro-phenyl-propionic acid, $C_6H_4(NO_2) \cdot C \cdot C \cdot COOH$, the final product, which is sold to the calico printer. When wanted for use it is made alkaline with borax, thickened with starch, and, after adding glucose for a reducing agent, printed upon the cloth. On hanging in the air the cloth turns blue, wherever the mixture was printed, from the formation of indigo by the reducing action of the glucose upon the ortho-nitro-phenyl-propionic acid. Artificial indigo is expensive, and is not now used.

VII. ANTHRACENE COLORS.—*Alizarine* is the most important color of this class. It was first prepared synthetically by Graebe and Liebermann in 1869, and was the first example of the artificial production of a vegetable dyestuff. *Alizarine* is the chief tinctorial constituent of madder (q.v.). It is now prepared from anthracene on an enormous scale by the following process: the anthracene, $C_{14}H_{10}$, is first oxidized to anthraquinone, $C_{14}H_8O_2$, and this is heated with fuming sulphuric acid, producing anthraquinone sulphonic acid. The latter compound is converted into alizarine by melting it with caustic potash. The alizarine is sent to market in the form of a yellowish paste containing about 80 per cent water. It is chiefly used for dyeing and printing cotton, and is applied like madder. With alumina mordants it gives shades from pink to red, and with iron mordants from violet to black. *Alizarine orange*, is prepared by treating alizarine with nitric acid. It is applied like alizarine, and it dyes yellower shades. *Alizarine blue* is produced by heating alizarine orange with glycerine and sulphuric acid. It is usually printed on calico with a chromium mordant, and gives a fine deep blue. All the alizarine colors are permanent. The well-known turkey-red is now produced entirely with artificial alizarine.

DYING DECLARATION. By the law of all nations, the declaration of a party, made in the immediate prospect of death, relative to the mode of his death, is received as evidence. The ground of this exception to the general rule of law, that hearsay evidence is inadmissible, is thus clearly stated by lord chief baron Eyre. "That they are declarations made in extremity, when the party is at the point of death, and when every hope of this world is gone; when every motive to falsehood is silenced, and the mind is induced, by the most powerful considerations, to speak the truth: a situation so solemn and so awful is considered by the law as creating an obligation equal to that which is imposed by a positive oath in a court of justice." In Scotland, the dying declaration of a witness is admissible even though he is not himself conscious of the danger of death.

In this respect, the law of Scotland differs from that of England and America. The general rule as to dying declarations are, that they cannot be received in any civil case, and in criminal cases only where the death of the deceased is the subject of the charge, and the circumstances of the death are the subject of the dying declaration. They must be made, except in Scotland, with the full knowledge of impending death; they are subject to the ordinary rules of law as to capacity to give evidence; they must relate to facts only, and not opinions, and must be freely made; they must be complete in themselves, and if it appear that the dying man intended to qualify them, they cannot be received. See Taylor on *Evidence*.

DYKE, or **DIKE** (Dutch, *dyk*), an artificial mound along the bank of a river or seashore, erected for the purpose of preventing inundation. The term is from the same root as *dig*—hence also *ditch*, or the hollow from which the D. is formed. The French employ the term *levée* to signify this species of embankment, of which there is a notable example in the *levées* erected along the Mississippi near New Orleans. The principle on which dykes or levés are formed is very simple. The embankment must be of sufficient breadth and height to resist the pressure of the water, and must be constructed with that easy slope which will allow the floods to rise without any particular impediment. This is quite understood in practical engineering. Flowing water must not be abruptly resisted, but suffered to rise gradually and expend itself. It is accordingly of the first consequence, in all attempts to restrain water by embanking, that the mounds should possess not only magnitude, but a very gradual rise in the side which has to resist the impact of the flood. For want of attention to this method of embanking, there has often been much ineffectual dyking of the sea and rivers liable to do damage by flooding.

In no country has the erection of dykes been carried to such a length as the Dutch Netherlands. Consisting to a large extent of low meadow-land, formed of materials brought from Switzerland and Germany by the Rhine, there is a constant liability to be deluged by the several branches of that river previous to their entering the sea. Inspired by a sense of their perilous situation, as well as a naturally industrious and painstaking disposition, the Dutch have for ages been distinguished for their ingenious system of river-embanking; till at length the dykes of Holland are spoken of as almost one of the wonders of the world. While the country generally is guarded against sea-inundations by high mounds of sand or dunes, created by the deposit of light sand blown from the level shores (see **DUNES**), the interior is secured from the rivers by the system of dykes here referred to. These ramparts are in appearance long green mounds, broad at the base, graduated in their slope, and often of sufficient width to admit of a canal or road, or both, being formed along the top. To give strength to the fabric, willows are planted and also interwoven like wicker-work on the sides. Carried along the banks of rivers, and in some places along the margin of the sea, as well as crosswise in different parts of Holland, a singular network of embanking is presented, which answers the double purpose of a protection from inundation and a means of having canals, by which superfluous water pumped from the meadows, or *polders*, may be run off into the sea. The whole system of dyking is placed under local and general superintendence, at a considerable cost to the public. One of the most gigantic of these dykes is that along the Helder; it measures about 6 m. in length, 40 ft. broad at the summit, along which there is a good road, and descends into the sea by a slope of 200 ft., inclined about 40 degrees. Notwithstanding the precautions taken, one or other of the lower branches of the Rhine occasionally overflows its banks and lays a wide district of country under water. One of these inundations took place in the winter of 1860-61, and, committing immense havoc, was the cause of much loss and suffering. A good example of dyking for the purpose of drainage is shown near Haarlem, where it has facilitated the withdrawal of the Haarlem lake (q. v.).

DYKES. In volcanic districts, rents frequently occur which are filled with molten materials from below, that subsequently solidify, and form solid walls, filling the fissures, and separating the edges of the disjointed strata. To these walls, geologists apply the term *dyke*, a Scottish word for a wall or fence. Similar walls of intruded matter occur in stratified rocks of all ages, and have been connected with volcanic eruptions belonging perhaps to every geological epoch. They consist of similar materials to whatever period they belong—viz., lava, either in a granular, compact, or glassy condition. The D. connected with Vesuvius have been minutely described. Those in the great escarpment which Somma presents to the modern crater of Vesuvius permit of a careful examination. They are chiefly vertical, and traverse at right angles the beds of lava, scoriæ, breccia, and sand which form the ancient cone. They project in relief several inches, or sometimes feet, from the face of the cliff, being extremely compact, and less destructible than the intersected tufts and porous lavas. In vertical extent they vary from a few yards to 500 ft., and breadth from 1 to 12 feet. Many of them cut all the inclined beds in the escarpment from top to bottom, others stop short before they ascend above half-way, and a few terminate at both ends, either in a point or abruptly. In mineral composition, they scarcely differ from the lavas of Somma. Their texture is different at the edges and in the middle; towards the center, the rock is larger grained, while at the edge it is always finer grained, sometimes vitreous. This evidently arises

from the rate of cooling, it being known that molten trap or lava, when suddenly cooled, assumes a vitreous structure, while a slow cooling, as it permits the mass to remain in a condition fitted for the operation of the crystalline force, and the segregation of the separate materials, produces a more or less granular structure, in proportion to the time occupied in cooling. The rock forming the D. is far more compact than that of ordinary lava, for the pressure of a column of melted matter in a fissure greatly exceeds that in an ordinary stream of lava; and pressure checks the expansion of those gases which form vesicles in lava. When the fissures have been openings for the egress of molten matter, the surfaces have been worn and smoothed by the current, the intense heat having melted all projections and obstructions to the passage of the incandescent fluid.

The appearances of ancient trap-dykes are very similar to those of recent volcanic dykes. Trap-dykes generally are prominent objects in the landscape, because, while the softer rocks through which they have intruded have been abraded by the sea, rivers, or rain, they, being more compact, stand out prominently in the face of precipices or on the level surface of a country. Sometimes, however, from chemical action, and chiefly from the oxidation of the iron which all trap-rocks contain to a greater or less extent, the intruded dyke decomposes more rapidly than the containing rock. It then for some feet or yards leaves the original fissure again unoccupied. A singular modification of this arrangement may sometimes be noticed, when the intrude digneous rock has so indurated the beds through which it passed as to make them less liable to weather than the unaltered portions of the beds, or than even the dyke itself. In such cases, we find two parallel walls of indurated strata rising above the general level of the country, and forming the banks of a ditch produced by the disappearance of so much of the dyke.

DYMOND, JONATHAN, 1796-1828 ; an English writer, a member of the Society of Friends. He was an expositor of the moral principles of his sect, and though actively engaged in business, published, in 1823, an *Inquiry into the Accordance of War with the Principles of Christianity*, which attracted wide attention. He also wrote *Essays on the Principles of Morality, and on the Private and Political Rights and Obligations of Mankind*, published after his death.

DYNAMETER, an instrument for measuring the magnifying power of a telescope. The power of a telescope is found by dividing the solar focal distance of the object glass by the focal distance of the eye-piece; which quotient equals that of the effective diameter of the object glass, by the diameter of the image formed at the solar focus, and seen through the eye-piece. The object of the dynameter is to measure the diameter of this image. Ramsden divided a positive eye-piece into two equal parts, and caused the halves to slide along at the dividing line, by means of a fine screw apparatus. Each half lens gives a separate image, and the distance of the two centers, measured by the turns of the screw which bring the images into contact, gives the distance between the centers of the images, or the diameter of one of them.

DYNAMICS is that division of mechanics (q.v.) which contains the doctrine of the motion of bodies produced by forces. It is essentially a science of deduction from the laws of motion (see MOTION, LAWS OF), under which head will also be found a brief sketch of the growth of the science. The branches of D. capable of being treated in the present work will be found discussed under separate heads. We shall here confine ourselves to giving a view of the main branches and their correlation. I. The first branch of D. deals with the fundamental conceptions of the science, their names and definitions, such as velocity (q.v.) and the different kinds of motion (q.v.), and accelerated motion (q.v.); force, accelerating force, and moving force (see FORCE). Under this branch also falls the composition of motions (see COMPOSITION OF FORCES AND MOTIONS). II. The second main branch of D. treats of the motion, free or constrained, of points. Here two problems are solved in each case—i.e., whether the motion be free or constrained—viz., a direct and an inverse problem; as, for example: 1. To determine the path of a point when the forces are given which act upon it; 2. To determine the forces or force acting on a point when its path is given. This division of dynamical problems into direct and inverse, obtains in all the branches. It may be mentioned that it was by solving the inverse problem that Newton and Huygens effected their greatest glories in connection with dynamics. The method of treating the case of a free point now generally employed, is due to Euler. See, under this head, CENTRAL FORCES; FALLING BODIES, and PROJECTILES. III. The third main branch of D. is concerned with the motion of a rigid system of points, or of a solid body. Few of the sub-branches of this part of D. are capable of exposition in this work, but see CENTER OF GYRATION, CENTER OF OSCILLATION, CENTER OF PERCUSSION, and PENDULUM. The honor belongs to D'Alembert of establishing a general method of treating problems in rigid dynamics. Previous to his time, each set of such problems was treated on some principle peculiarly applicable to itself. D'Alembert invented one (which goes by his name) applicable to all such problems. For a statement of this principle, see RIGID DYNAMICS. IV. The fourth main branch of D. is concerned with motions of rotation. A system of rigid points may be subject to two independent kinds of motion. It may suffer a motion of translation in space, or a motion of rotation about some point or axis within itself, or it may suffer at once a motion of translation and a rotatory motion.

These may clearly be treated conjunctly or independently; they are now uniformly treated independently, by investigating, 1. The velocity and direction of the center of gravity of the system; and 2. The direction at each instance of the spontaneous axis of rotation passing through the center of gravity (see ROTATION), and the velocity of the rotation of the system round that axis. To effect the second task, Poinsot proposed his theory of couples (q.v.). For the conservation of living forces (*virium vivarum*), and the principal of least action, see FORCE. See also MOMENT. D. is used by some recent writers with a wider signification, as denoting the science which investigates the action of force (1) in compelling rest or preventing change of motion, and (2) in producing or changing motion; the former branch being called *statics*, and the latter *kinetics*.

DYNAMIC UNITS are units for measuring forces and their effects. It is an axiom of mechanics that if a body at rest be impressed by a momentary force, and meet no resistance other than its own inertia, it will move in a straight line with a velocity dependent upon the initial force; e.g., twice the force will develop twice the velocity. Also, if the mass of the body be increased, the force must be increased in like ratio to impart the same velocity; e.g., double the mass will require double the force; or, if the force remain unchanged, double the mass will move with half the velocity. Combining the two statements, we find that the velocity varies directly as the force, and inversely as the mass; velocity equals force divided by mass, or $v = \frac{F}{M}$. From this we have $F = Mv$.

The unit of force is that force which will impart a unit of velocity to a unit of mass; that is, which will cause a unit of mass to move through a unit of space in a unit of time. If the force considered be that of gravity (*g*), whose action in the same place is practically uniform, and if we remember that the measure of the force of gravity upon a body is the weight (*w*) of that body, we have $W = Mg$. If the force of gravity act upon a mass for one second, it will impart to it a velocity of 32.16 ft. per second, at New York, approximately. $g = 32.16$ ∴ $W = Mg = Mv$, or $W = M \times 32.16$, whence $M = W \div 32.16$.

In $W = Mv$ substitute $v = \frac{F}{M}$, whence $W = \frac{MF}{M} = F$. The English and American unit of force is the weight of a pound mass avoirdupois; and the corresponding unit of mass is one pound divided by 32.16. The term "pound," used as a unit of force, must be understood to mean the *force* exerted on a pound mass at some particular locality, i.e., New York or London.

The *unit of work* is the amount of work which will raise a unit of weight through a unit of space. The two items are indicated in the name foot-pound, which by analogy might be exchanged in proper ratio for inch-ounce, mile-ton, etc. The French unit of work is the metre-kilogram. The horse-power is an arbitrary unit, being the force required to perform 33,000 units of work or foot-pounds, per minute. It may be called the *unit of rate of working*. The French *cheval a vapeur* is 75 metre-kilograms per second, and is equivalent to 32.550 foot-pounds per minute, or a little less than our horse-power. The theoretical horse-power is merely a conventional quantity, the actual work of horses averaging about 17,000, and rarely exceeding 32,000 foot-pounds per minute.

DYNAMITE, a powerful explosive compound, now much used in mining, in breaking up old metal, in torpedoes, etc. The names lithofracteur, glyoxiline, nitrate of methyl, etc., are applied to the same or similar substances, of which nitro-glycerine is the main ingredient. See NITRO-GLYCERINE, EXPLOSIVES.

DYNAMITE CRUISER, THE. The name *Vesuvius* was bestowed upon the first dynamite cruiser built by any of the naval powers, and the vessel was constructed by contract under an act of congress appropriating the sum of \$350,000 for the purpose. The name dynamite cruiser is considered rather a misnomer by experts, who are of the opinion that she will never use that explosive, but that gun-cotton or some other high explosive more safely handled than dynamite will be selected. What the vessel really is intended for is the projection of a large mass of high explosive to a distance.

Her appearance is very similar to an enlarged torpedo boat, having a low freeboard of but 5 feet, no bulwarks, great crown to her deck, approaching that of an ordinary turtle-back, and great length in proportion to her beam. Her dimensions are: length on water line, 239 feet; length over all, 246 feet; extreme beam, 26 feet 6 inches; depth from base line to top of gunwale, 13 feet; mean draught, 9 feet 3 inches; displacement, 810 tons. She is built of steel, with the exception of the stem, stern-post, and rudder, which are of forged iron. The framework is very light, and is in one piece from keel to gunwale, weighing but 7 pounds per lineal foot, while the reverse frames weigh but 4 pounds per lineal foot. The deck plating is but $\frac{3}{8}$ inch thick and is planked with white pine. Water-tight bulkheads $\frac{1}{2}$ inch thick divide the vessel into a number of compartments, each of which has its individual drainage. A steel conning tower 1 inch thick is situated forward.

The three-bladed twin screws are worked by two vertical, four-cylinder, triple-expansion engines of about 4,000 indicated horse-power. The diameters of cylinders are: high powered, 21.5 inches; intermediate, 31 inches; and the two low powered, 34 inches; the length of stroke is 20 inches and the estimated piston speed 930 feet. Steam is supplied by four three-furnace locomotive-boilers, 9 feet in diameter, 19 feet 8 inches long, with a grate surface of 200 square feet. The coal capacity is 150 tons.

The main armament is three pneumatic tubes, fifty-five feet long, side by side, and built into the forward part of the vessel at an angle of 18° with the horizon. The muzzles project slightly above the deck near the bow. The only train that can be given the gun is by the helm, the shells being thrown in the line of the keel. The range is varied by increasing or decreasing the pressure of air admitted into the tubes. The secondary battery is composed of three 3-pounder rapid-fire guns so mounted as to command the entire horizon. The vessel is well fitted with a complete electrical outfit, a single plant rather than the customary double one being deemed sufficient. It may be used for a search light of minor power and for a certain number of incandescent lamps.

The speeding trial took place on January 11, 1889. The vessel displacing 810 tons was run twice over a measured base 2.54 knots long. The trials were made in Delaware bay near the end of the ebb tide. The first run, with the tide, gave a speed of 22.95 knots, the second, against the tide, 20.35 knots, or a mean speed for the trial of 21.65 knots, 1.65 knots above the 20 knots the contract required. The mean boiler pressure was 160 pounds, and the mean number of revolutions, 271.85. A progressive trial resulted in 10.6 knots with 125.3 revolutions, 14.9 knots with 175.75 revolutions, and 18.9 knots with 230.6 revolutions. The coal allowance of 150 tons gives a steaming radius of about 5800 nautical miles, at a speed of 10 knots.

In addition to the above trial, the ability of the vessel to project a shell every two minutes was conclusively proven, as was the possibility of throwing large masses of gun cotton without danger from explosion. Later tests, however, were less satisfactory.

DYNAMITE GUN, THE. The portion of a ship which can be protected from high-power guns of even medium calibres, is now reduced to a mere citadel, as at the present date the gun has practically overpowered the armor which may be carried afloat. The mere momentary supremacy of the armored protection of the over-water hull led to greater activity in the development of the submarine torpedo attack. This having been brought to a point where it has necessitated consideration, the under-water hull has been strengthened somewhat, and cellular subdivision renders the relatively small charges used heretofore in movable submarine torpedoes ineffective. Now, however, we are presented with the pneumatic torpedo-gun, which is capable of accurately throwing very large charges of high explosives to greater distances than those attainable by movable torpedoes. Perforation of the over-water hull by ordinary projectiles is likely to produce only local injury, whereas the crushing-in of the under-water hull is more certain to be fatal, the more heavily the ship is weighted with armor. Considerations of this nature have been the great incentives for the development of the pneumatic dynamite gun. Mr. Mefford, of Ohio, was the inventor of a 2-inch gun for the propulsion of high explosives in 1883, and at the close of that year Lieutenant E. L. Zalinski, 5th U. S. Artillery, became interested in the idea, and has ever since been actively interested in its perfection. Following the 2-inch gun came consecutively the 4-inch, 8-inch, and 15-inch guns, and the building of the dynamite cruiser (q.v.) *Vesuvius*. In the various steps that have been taken the form of the gun and of its carriage have been considerably modified, and its range has been greatly increased. The principal points of improvement are the balancing of the barrel of the gun on hollow trunnions, and mounting it on a carriage which can be turned through an entire revolution, the application of motors for elevating and training the gun, and the firing mechanism by means of which great accuracy in firing is secured, and all errors from personal equation are eliminated. The gun is a smooth bore, and is made of cast iron in several sections, provided with flanges which are bolted together, forming a tube having a length of fifty feet and an internal diameter of fifteen inches. The joints are provided with packing which automatically tightens with the increase of pressure. The trunnions communicate with an annular air space surrounding the barrel between them and the breech, and turn in boxes which convey air to the trunnions in whatever position they may take. A bronze sector attached to the under side of the gun within the carriage, is engaged by a worm arranged to be operated by an electric or water motor. There is a circular rack at the base for training the gun, also worked by water or electricity. In addition hand gear is supplied for the above purposes. There is a quick-closing breech piece which packs itself automatically as soon as the air pressure is exerted upon it. The main firing valve is operated by air pressure controlled by an auxiliary valve, the latter in turn controlled by another at the trunnions, operated by the gunner, who occupies the platform at the left side of the carriage. An arrangement of pneumatically worked pistons and valves operate the opening of the main firing valve automatically. After the firing lever has been moved, the gunner has no control whatever over the speed of the movement of the main valve, the entire operation proceeding with mathematical accuracy. The loading and firing mechanism is arranged on the interlocking plan, so that the different operations must succeed each other in regular order, insuring safety to the gun and its operators, and saving considerable time. The total weight of the full calibre projectile is 1000 pounds, the charge of high explosive alone weighing 500 pounds. The range of the gun at 35° elevation with the large projectile is 2400 yards; with a 10-inch sub-calibre projectile weighing 500 pounds, it is 4400 yards; with an 8-inch weighing 340 lbs., it is 5000 yards, and with a 6-inch it is 6000 yards. The weight of the explosive charges in the sub-calibre projectiles is respectively 200, 100, and

50 pounds. The full calibre shell is retained in its proper trajectory by a tubular tail piece having affixed thereon spiral steel vanes, which serve to rotate the shell and keep it point foremost. The sub-calibre shell may be of any diameter smaller than the bore of the gun; they are kept centred in the bore by an attached gas-check of the full size of the bore, and by centring pieces attached to the body of the shell near the conical point. These are loosened from the body by the air pressure when the gun is fired, and leave the projectile when clear of the muzzle. Spiral vanes attached to the rear of the shell retain it in its trajectory. The firing pressure in the air reservoirs is 1000 lbs. per square inch. This pressure is kept up by a supply from storage reservoirs containing air under a pressure of 2000 lbs. per square inch. The reservoirs are spherical, six feet in diameter, and made of cast steel. A most ingenious electric fuse, invented by Lieut. Zalinski, is fitted to the shell and consists of four parts, the electric battery, circuit breaker, low-tension igniter, and detonating cap. If delay action is required, a slow-burning train is inserted between the igniter and the cap. A double dry battery is placed in the point and at the rear end; the shell entering the water wets the elements and sets up a current which goes through a primer and ignites a detonator. The shell, striking any solid, crushes in the point, which closes the circuit of a wet battery also inserted in the shell, and explodes the charge.

DYNAMO. See MAGNETO-ELECTRIC MACHINES.

DYNAMOMETER, a device for measuring the force which does work in overcoming resistance and producing motion. The foot-pound, as a unit of work, has for its factors the force acting and the distance through which it acts. The larger unit, the horse-power, besides these factors has a third, the time during which the force is exerted. Hence, in getting the data from which the work of a machine is to be calculated, we are to observe the force, the distance, and the time required to accomplish a certain result. Strictly speaking, the dynamometer indicates the first of these items, but it may be so arranged as to show both the others. Dynamometers are designed to indicate the force of *traction, of thrust, or of rotation*. A traction dynamometer may be interposed, for example, between a team of horses and a reaper or a plough, to measure the force exerted by the horses in drawing the machine. It is usually some sort of spring balance, fitted with an index and a scale; the figures on the scale show the number of pounds required to bring the index to the corresponding points, if the instrument were hung up and weights suspended by it. A dynamometer for thrust is often connected with the screw-shaft of a steamship, to measure the force with which the screw is driving the vessel through the water. Rotary dynamometers measure the force of a mill-shaft, either by showing what force is required to hold the shaft in check, by absorbing the motion, or what force the shaft transmits to other machinery. Nearly all forms of dynamometers are too complex to be described without the help of elaborate drawings and technical descriptions, for which the reader is referred to special works on mechanism. The use of the dynamometer in skillful hands has acquired great value in exchanging the rough and usually overestimated guesses of the efficiency of machines for the exact determination of their performance.

DYNASTY, in the general use of the word, refers to a line of succession of sovereigns of the same family or race. Thus in ancient Egypt there were thirty different dynasties, or lines of native sovereigns. In French history we speak of the Bourbon dynasty, that is, the sovereigns of the Bourbon family, and in English history, of the Plantagenet and Stuart dynasties.

DYRRHA'CHIUM. See DURAZZO.

DY'SART, a royal, parliamentary, and municipal burgh and seaport in the s. of Fifeshire, on the rocky shore of the firth of Forth, 12 m. n.e. of Edinburgh. It chiefly consists of 3 streets, with a small square. In the High street are many antique houses.

DYSCRA'SIA (Gr. *dys*, difficult, and *krâsis*, a mixture), a pathological term much used in Germany by certain authorities, to indicate an altered condition of the blood and fluids of the system, leading to constitutional diseases, as dropsy, cancer, delirium tremens, lead-poisoning, etc. See CACHEXIA and DIATHESIS.

DYSCHROMATOPSY. See COLOR-BLINDNESS.

DYSENTERY (Gr. *dys*, difficult, and *enteron*, the intestine), a form of disease attended by discharges from the bowels, and differing from diarrhœa (q.v.) chiefly in being attended by marked fever and pain, as also by the presence of blood and inflammatory products in the discharges. Dysentery is, in fact, a disease of the mucous membrane of the colon (q.v.) or great intestine. Two forms of dysentery are recognized by medical authorities, sporadic and epidemic. The causes, however, are supposed to be the same in both. It is essentially a disease of hot weather, or hot climates. There being no doubt of the epidemic character of the disease in certain seasons and in certain localities, it follows that a peculiar poison must be the generating cause, heat perhaps operating to aid in generating the poison or contagious matter. Post-mortem examinations show the mucous membrane of the colon and rectum (see ALIMENTARY CANAL) to be the seat of much morbid action. Extensive ulcerations are frequently found, which are the seats of the hemorrhage or bloody discharges, having been caused by the inflammation of the parts, abundant evidence of which exists, the membrane often being found greatly engorged with blood, thickened and pulpy, in some cases of a very dark color and almost disorganized. The portal circulation (see LIVER) is greatly obstructed

in nearly all cases, probably in all severe cases, and it is certain, under the circumstances, that the peculiar *materies morbi* or morbid principle or matter of dysentery paralyzes or greatly arrests the functions of this organ. Now, as all the blood from the intestines passes through the liver on its return to the lungs and heart, the functional disturbance which exists in this organ must necessarily produce more or less obstruction in the capillary circulation in the intestines, and greatly interfere with their nutrition and relative functions. Practically, therefore, the treatment of the disease involves the consideration of those remedies which are supposed to exert a decided influence upon the functions of the liver. One of these remedies, which has been greatly lauded, and also greatly condemned, is mercury, particularly that preparation of it called *calomel*; one party contending that the administration of the drug in minute and repeated doses (especially when alternated with alkaline carbonates to restore the alkalinity of the blood) exerts a powerful influence in restoring the tone of the capillary circulation in various organs, and consequently their functional activity; above all, that this power is peculiarly manifested with reference to the liver; and they adduce numerous examples to establish the correctness of their opinions. On the other hand, several eminent authorities deny the correctness of the theories and positions of these advocates, and affirm that their experience and experiments, as well as all sound therapeutical theories, are decisive against the opinion that calomel possesses the peculiar virtues which are claimed for it. If this remedy be used, it should be in minute and frequently repeated doses— $\frac{1}{2}$ to $\frac{1}{4}$ of a grain every 2 hours; and sometimes oftener— $\frac{1}{16}$ to $\frac{1}{8}$ of a grain every hour. It should always be combined with sufficient opium in some form to allay the griping and other pain, and arrest the straining. Alkaline carbonates should also be given. It is recommended by many authorities that when a laxative is given in the commencement of the treatment, a saline, as sulphate of magnesia or Rochelle salts, should be preferred. Hygienic measures are of the greatest importance. The strictest attention should be paid to cleanliness and ventilation. Pure, fresh air is necessary, not only as a tonic to the nervous system, but as one of nature's principal means of eliminating effete and poisonous matter. Counter-irritants in the form of sinapisms, made weak and continued, are frequently of great advantage in aiding to restore the capillary circulation in the diseased parts, by arousing a reflex influence in the nervous system. The diet is of no secondary importance, and should be bland and nutritious. Eggs, raw or very slightly boiled, mixed with Catawba or sherry wine, or brandy; rice water, as a beverage, combined or alternated with beef-tea, will often afford nourishment not easily supplied in other ways. Rare beefsteak, if chewed and the juice swallowed, often affords a good form of food; toast and tea also may be taken. Tea for the sick-room should always be of the most delicious kind, and freshly prepared, and *weak*. Pure water, actively boiling, should be poured upon a proper quantity of tea in an earthen vessel, and allowed to stand not more than two or three minutes before being turned off, as the continued presence of the leaves allows of the absorption of too much tannin and other extractive matter, by which the fragrance and best qualities of the beverage are injured.

DYSLYSINE is an organic substance ($C_{48}H_{36}O_6$) obtained by boiling cholidic acid with hydrochloric acid for some time. It is a neutral resinous body, which is difficultly soluble in naphtha, turpentine, and other common solvents.

DY SODIL, a yellow or grayish laminated bituminous mineral, often found with lignite. It burns vividly, and diffuses an odor of asafetida.

DYSPEPSIA (Gr. *dys*, difficult, and *pepsis*, digestion), a scientific term for indigestion (q.v.).

DYSPHONIA, signifying primarily difficult speaking, of which the most common example is the disease popularly known as "clergyman's sore-throat." It is attended with inflammation, huskiness, coughing, expectorating, and sometimes ulceration. Rest of the vocal organs, muscular exercise, tonics, and change of air and scene, are helpful towards recovery. It is a recent theory that, with preachers, this trouble arises from the forcible use of the voice only one day in seven, after six days of quietness—the injury arising not from the use, but from the sudden and violent change involved in the use; thus indicating as a remedy or preventive such daily vocal exercise as shall avoid a sudden strain on any one day.

DYSPNŒA (Gr. *dys*, difficult, and *pnœa*, breathing), a word the meaning of which is sufficiently indicated by its etymology. See **ASTHMA**; **RESPIRATION**, **ORGANS AND PROCESS OF**.

DYSURIA (Gr. *dys*, difficult, and *ouros*, urine), a difficulty of passing urine. It may depend on a variety of causes, as regards which, see **BLADDER**; and **URETHRA**.

DYTISCUS (Gr. *dytes*, a diver), a Linnæan genus of aquatic coleopterous insects or water-beetles, now forming the tribe or family *dytiscidæ*. They are *pentamerous* coleoptera; that is, have all the *tarsi* five-jointed. Their general form is oval, the outline little broken, and the surface very smooth. The respiratory organs of the perfect insect are not adapted to the extraction of air from water, and it must occasionally come to the surface to breathe, where it rests for a short time back downward, and with the extremity of the abdomen exposed to the air, the openings of the air-tubes being in the last

segment. The *dytiscidæ* are excessively voracious, feeding upon any kind of animal food, and boldly attacking creatures larger than themselves. They are very amusing inmates of the fresh-water aquarium, and sometimes live in it for a year or two, getting tame, and readily coming to be fed with small earth-worms, bits of beef, etc. The species are numerous, and vary much in size, some being very small, and some almost 2 in. in length. A very common British species is *D. marginalis*, about an inch and a quarter in length, of a dark olive color, the thorax and outer sides of the elytra margined with yellow. All the species are found in lakes, ditches, marshes, and the still parts of rivers. They often leave the water by night, and can fly well. Their larvæ have the body long and tapering, composed of eleven rings or segments, besides the head. They hide themselves in the earth, in chambers which they make for themselves, before changing into pupæ.

DY VEKÉ (i. e., *dove*), called by the Latin chroniclers Columbula, the mistress of Christian II. of Denmark, has been often celebrated in works of poetry and fiction. She was born in Amsterdam in 1488, and Christian became acquainted with her in 1507, in Bergen, where her mother, Sigbrit Wylms, had settled as an innkeeper. She followed him to Opslow, and, when he mounted the throne, to Copenhagen. Notwithstanding the marriage of Christian with Isabella, the sister of the emperor Charles V., his relation with D. was continued, and her mother acquired unbounded influence in the affairs of the country. Though D. herself never interfered, she was naturally hated by the party of the nobles; and her death, which happened suddenly in 1516, was attributed, with almost certainty, to poison. The poison was understood to have been administered to her in cherries by the noble and proud relations of the governor of the palace, Torben Oxe, who was a suitor for the affections of Dyveké. On her death, the character of Christian broke out in all its savageness. He first ordered the treasurer Faaburg to be executed for having said that Torben Oxe had enjoyed the favor of D.; and then at the instigation, as was given out, of a nightly vision, Torben Oxe himself. Samsøe, a Danish poet, wrote, about the end of the 18th c., a tragedy called *Dyveké*, often represented in Copenhagen. The story has since been made the subject of several novels and tragedies; e. g., *Wilhelm Zabern*, by J. C. Hauch, a Dane; and Riekhoff's tragedy, *Dyveke* (Berl. 1843).

DYVOUR AND **DYVOUR'S HABIT** (from the Fr. *devoir*, to owe; a debtor). In the old legal language of Scotland, a D. seems to have been synonymous with a bankrupt. Skene speaks of a D. or "bairman" (bare-man), as one who, "being involved and drowned in debts, and not able to pay or satisfy the same, for eschewing of prison and other pains, makes cession and assignation of all his goods and gear in favor of his creditors, and dons his devoir and duty to them, proclaiming himself bairman and indigent, and becoming debt-bound to them of all he has." It was ordained by act of sederunt of 17th May, 1606, that a pillory be erected near the market cross of Edinburgh, with a seat upon it, upon which dyvours shall be exposed once on a market day; and before their liberation from jail, they are required to provide themselves with a hat or bonnet of yellow color, to be worn by them while thus exposed, and constantly thereafter, while they continue dyvours, under pain of three months' imprisonment if they be found without it. By subsequent acts (26th Feb., 1699, and 23d Jan., 1673), the dyvour's habit is appointed to be a coat or upper garment, half yellow and half brown, with a party-colored cap or hood, to be worn on the head; any of his creditors being entitled to imprison him if he be found without it. The act of sederunt of 18th July, 1688, prescribes as the dyvour's habit, "a bonnet, partly of a brown and partly of a yellow color, with uppermost hose, or stockings, on his legs, half brown and half yellow colored, conform to a pattern delivered to the magistrates of Edinburgh, to be kept in their tolbooth;" and declares that the lords will not hereafter dispense with it, unless in the case of innocent misfortunes. Finally, by statute (1696 c. 5), the lords of session are prohibited from dispensing with the dyvour's habit unless, in the process of cessio bonorum (q. v.), the bankrupt's failure be alleged and proved to have been by misfortune. This statute is repealed, and the dyvour's habit abolished, by 6 and 7 Will. IV. c. 56—previous to which time the barbaric practice of wearing the habit had, by sufferance of the court, been departed from.

DZE'REN. See ANTELOPE.

DZIG'GETHAI, **DJIGGETAI**, **KIANG**, **KHUR**, or **GOOR**, *Equus hemionus*, a quadruped nearly allied to the ass, and believed to be the *hemionus* of Herodotus and Pliny. See ASS. It inhabits the elevated steppes of Tartary, extending into the s. of Siberia and to the borders of India. In appearance and characters, it is intermediate between the horse and the ass, whence the ancient Greek name *hemionus* (half-ass). In size it approaches the horse, which it resembles also in gracefulness of action, and in its neighing, which is even more deep and sonorous. Its general shape is much like that of a mule. The D. lives in small herds, sometimes of several males and several females, sometimes of a single male with about twenty females and foals. It is an animal of great fleetness and shyness, or watchfulness, and possesses also great powers of endurance in flight, so that it is with difficulty killed by the hunter. The Mongols and Tungûs, however, hunt it very eagerly on account of its flesh. It has been domesticated

and reduced to the service of man, but there does not seem to be any evidence of its ever breeding in a state of domestication.

DZUNGARIA, or **SONGARIA**, a former Mongolian kingdom of central Asia, destroyed by the Chinese invasion about 1757-59. It included most of that part of central Asia, extending from 35° to 50° n., and from 72° to 97° east. A part of this territory now belongs to China, and part to Russia.

E

E, **THE** fifth letter in the Greco-Roman alphabets. Its original and fundamental sound is that heard in *Eng. tent*. The sound heard in *me* is not given to it in any language but English. In the series of vowels it stands intermediate between *i* and *a*. See **LETTERS AND ARTICULATE SOUNDS**, where the various vowel-sounds represented by the character *e* in English will be noticed.

E, in music, is the third note or sound of the natural diatonic scale, and is a third above the tonic C, to which it stands in proportion as 5 to 4. As a major third, that is, when the tonic C vibrates 4 times, the E above vibrates 5 times. E is the third harmonic which arises naturally from C as a fundamental note. E major, as a key, has four sharps at its signature, viz., F, C, G, and D sharp. E minor, as a key, has only one sharp, F, same as G major, of which E is the relative minor.

EACHARD, JOHN, D.D., 1636-97; an English divine, educated at Cambridge, where he became master of Catherine hall. He was a doctor of divinity, and for two terms vice-chancellor of the university. He published a number of half-satirical attacks upon the clergy, among them *The Ground and Occasions of the Contempt of the Clergy inquired into, in a Letter to R. L.*; and, in answer to attacks upon this work, he issued *Some Observations, etc., in a Second Letter to R. L.* He attributed the contempt into which the clergy had fallen to their imperfect education, their insufficient incomes, and the want of a true vocation, giving amusing illustrations of the poverty and absurdity of the pulpit oratory of the day. In a similar vein of satire, he attacked the philosophy of Hobbes. Swift called him a successful humorist who failed as a serious writer.

EADIE, JOHN, D.D., LL.D., 1810-76; b. Scotland; educated at Glasgow university, and in 1835, ordained minister of the Cambridge street Secession church in Glasgow. In this position he took part in the union, in 1847, of his denomination with the Relief church, under the name of the United Presbyterian church. He became the leading representative of the latter denomination. Most of his written works were in connection with biblical criticism and interpretation. Among them were a *Biblical Cyclopædia*; an *Analytical Concordance*; *Early Oriental History*; *Life of Dr. Kitto*; and *History of the English Bible* (1876). See *Life*, by James Brown (1878).

EADMER OF CANTERBURY, a man of considerable mark in the beginning of the 12th c., would seem, from his name, to have been the child of English parents. At an early age, he entered the Benedictine monastery of Canterbury; and when St. Anselm, in 1093, was made archbishop of that see, Eadmer became one of his most devoted friends, sharing his exile, watching his death-bed, ordering his burial, and writing the chronicle of his life. Eadmer continued at Canterbury, in high esteem with St. Anselm's successor, archbishop Ralph, until 1120, when, at the request of king Alexander I., he went to Scotland, and was there chosen bishop of St. Andrews. The question of lay investiture of ecclesiastical benefices was then in its crisis; there was a controversy between Canterbury and York for jurisdiction over the see of St. Andrews; that see, again, asserted its independence of either of the English metropolitans; and Eadmer seems to have added to all these perplexities a difficulty as to his monastic allegiance. "Not for all Scotland," he said to the Scottish king, "will I renounce being a monk of Canterbury." The king, on his side, was equally unyielding; and the issue was the return of Eadmer to his English monastery, unconsecrated, indeed, but still claiming to be bishop of St. Andrews. He was made precentor of Canterbury, and died, it is supposed, in Jan., 1124. He tells us that, from his childhood, he was a diligent observer of contemporary events, especially in church affairs; and this habit has given more than usual interest to his writings. The most valuable are his *Historia Novorum*, or history of his own times, first printed by Selden in 1623, and his *Vita Anselmi*, or Life of St. Anselm, first published at Antwerp in 1551. Both these works are included in the selection of his writings published by the Benedictines of St. Maur (as a supplement to their edition of the works of St. Anselm), in 1 vol. fol. (Paris, 1721). His lives of St. Odo, St. Dunstan, and St. Bregwyn, of Canterbury, and of St. Wilfrid and St. Oswald, of York, were printed, some of them, by Wharton, in the second part of his *Anglia Sacra* (Lond. 1691), and others by Gerberon in his *Anselmi Opera* (Paris, 1675). The history of Eadmer, in relation to the bishopric of St. Andrews, is given at considerable length by lord Hailes, in his *Annals of Scotland*, vol. i. pp. 59-71; and, still better, in Mr. Grub's *Ecclesiastical History of Scotland*, vol. i. pp. 209-217 (Edin. 1861).

EADS, JAMES BUCHANAN, b. Ind., 1820: removed to St. Louis and became clerk on a Mississippi steamer; went into the business of recovering sunken boats and cargoes, in which he made a fortune. When the civil war began, he offered plans for the defense of the western rivers, and undertook the construction of iron-clad gun-boats. In 1862, he built six iron-proof propellers, having two turrets each, in which he tried many of his own inventions. He was the constructor of the St. Louis bridge, of the important works for deepening the channel at the mouth of the Mississippi (see **JETTY**), and formed a company, 1887, to construct a canal across the isthmus of Tehuantepec. He d. 1887.

EAGLE, a w. central co. of Col., formed 1883 from part of Summit co.; 1600 sq.m.; pop. '90, 3725. It is very mountainous in the e., contains the celebrated mountain of the Holy Cross, and is watered by Grand and Eagle rivers. Co. seat, Red Cliff.

EAGLE (*aquila*), a genus of birds of prey, by some naturalists subdivided into several genera, constituting a group which contains the largest and most powerful of the *falconidae*. From the most ancient times, the E. has been universally regarded as the emblem of might and courage; and, like the lion, it has been fancifully invested with other attributes of greatness, such as men thought to harmonize with these. Its extraordinary powers of vision, the vast height to which it soars in the sky, the wild grandeur of the scenery amidst which it chiefly loves to make its abode, and perhaps also its longevity, have concurred to recommend it to poetic regard. It was associated with Jupiter in the Roman mythology; its figure on the standards of the Roman legions expressed and animated their confidence of victory.

The eagles have the beak not curved from the very base, like the true falcons, nor notched on the edge, neither are their wings so long in proportion to their size. Their wings are, however, very broad and expansive; their legs are very robust; their claws curved, sharp, and strong. In the most restricted use of the generic term, the true eagles, of which the golden E. may be taken as a type, have a rather short bill, curved from the cere, with a slight festoon on the edge of the upper mandible, the tarsi are short, and feathered down to the toes. This last character distinguishes them at once from the *ernes* (q.v.), often also called eagles. There are several species of true eagles well ascertained, although in this as in allied genera much confusion has arisen from the diversity of plumage at different ages.—The **GOLDEN E.** (*A. chrysaetos*)—of which what is called the ring-tailed E. is the young—is about 3 ft. or 3 ft. and a half in length, and 8 ft. in spread of wing. The female is rather larger than the male; the color is dark brown, in some parts almost black, the head and back of the neck in mature birds covered with pointed feathers of a golden-red color; young birds have a considerable part of the tail white. The golden E. is the largest of the European eagles, and is found not only throughout Europe, preferring wild and mountainous situations, but throughout almost the whole northern hemisphere: it is amongst the birds of India, of the n. of Africa, and of North America; and the savage warrior of the Rocky mountains, “as well as the Highland chieftain, glories in his E. plume.” Although occasionally seen in all parts of Britain, it builds its nest only in mountainous districts, carrying a few sticks and brambles to the inaccessible shelf of a rocky precipice, where the eggs are deposited almost on the bare rock. The golden E. is now rare even in the Highlands of Scotland. A great quantity of prey is necessary to support a pair of these birds and their two or three young ones; and not only hares, game of every kind, and lambs are carried to the eyrie, but larger animals are sometimes attacked, and almost every district where eagles build their nests has its stories of children carried off to feed the eaglets, and often of their almost miraculous preservation.—The next in size to the golden E. among the eagles of Europe is the imperial or Grecian E. (*A. imperialis*), but it is more common in Egypt than in Europe, and has never been seen in Britain.—The spotted E. (*A. naevia*) has occurred in the s. of Ireland.—There is an Australian E. (*A. fuscus*).

Eagles were ranked among what were called, in the language of falconry, ignoble birds of prey, as incapable of being tamed and employed to assist in the sports of man. But either the golden E. or the imperial E. is used by the Tartars in the chase of antelopes, wolves, foxes, hares, etc.

The white-tailed E. or cinereous E. of Britain is the common *erne* (q.v.). The white-headed E. or bald-headed E. of America—the chosen emblematic E. of the United States—is also an *erne*. What particular species was the emblematic E. of the ancients, is not more certain than what is the original emblematic Scotch thistle.—Others of the *U.* group of *falconidae* are known as marsh eagles, harpy eagles, eagle-hawks, ospreys, etc., some of which will be noticed in their places.

EAGLE, the king of birds, is used heraldically as an emblem of magnanimity and fortitude.

EAGLE, as a military standard, was adopted by the Romans, and even by nations preceding them in history. The Persians in the time of Cyrus the younger, bore an E. on a spear as a standard. The Romans for some time used the E., the wolf, the boar, the horse, and the minotaur for standards, but afterwards abandoned the last four, and confined themselves to the first. The Roman E., sometimes of gold, but more frequently of silver, was about as large as a pigeon with extended wings, and was borne on the top of a spear, with a cross-bar or a shield to support it. Some of the eagles were represented as holding thunderbolts in their talons, and usually bore the name of

the legion to which each respectively belonged. The E. was sometimes made of steel, but rarely.

In modern times France, Russia, Prussia, Austria, and the United States of America, have all adopted the E. as a national military symbol. The Austrian E. is represented double-headed.

EAGLE, a gold coin of the United States of America, of the value of ten dollars. See DOLLAR.

EAGLE, BLACK, ORDER OF THE, in Prussia, was founded by the elector of Brandenburg, on 17th Jan., 1701, the day of his coronation as king of Prussia. The number of knights, in addition to the princes of the royal family, was originally 30, but it is now unlimited. They must at their nomination be at least 30 years of age. They must prove their noble descent for four generations through both parents. A chapter is held twice a year.

The insignia of the order consist of an octagonal cross of blue enamel, and a black eagle, displayed between each of the arms of the cross. The cross is suspended by a broad ribbon of orange color across the left shoulder, and it is accompanied by an embroidered silver star, fastened on the left breast. The center of the star represents a black flying eagle, holding in one claw a laurel wreath, and in the other a thunder-bolt, with the legend, *Suum cuique*. Fifty ducats must be paid by every new member for the support of the orphan asylum at Königsberg, and he then receives gratis the costume and insignia of the order, of which a full description will be found in Burke's *Orders of Knighthood*, p. 199. As the black eagle is the highest order in Prussia, no member of it, with the exception of foreign princes and knights of St. John, is permitted to wear any other order along with it; and as it is generally granted only to those who are expected to be about the person of the king, no one who holds it is permitted to travel from the court more than 20 German miles without giving notice. Knights of the Black Eagle are likewise knights of the Red Eagle, first class. See next article.

EAGLE, RED, ORDER OF THE, in Prussia, founded in 1734 by the markgraf George Frederick Charles, as a reorganization of the "Ordre de la Sincérité," which had been instituted in the beginning of the century by the hereditary prince of Anspach and Baireuth. After passing through various modifications, the order of the red eagle was raised in 1791 by Frederick William II. to the rank of the second order in the monarchy, and it was then that the decoration of a white enameled Maltese cross, surmounted by a royal crown, with the Brandenburg eagle in the corner, was adopted. All the knights of the Black Eagle were received into this new order; and it was latterly decreed that only those who had been decorated with the red eagle, in the first instance, could be received into the black. In 1810, the order of the Red Eagle was reorganized, and two more classes were added to it. In 1830, the second class was subdivided into two, one of which only was allowed to wear a square star.

EAGLE HAWK, *Morphnus* or *Spizaetus*, a genus or sub-genus of *falconidæ*, of the eagle group, but consisting of species of comparatively small size, and characterized by short wings, long slender legs (*tarsi*), and comparatively feeble toes and claws. Some of the species are extremely beautiful in form and colors. They are natives of warm climates, chiefly of South America, but also of Africa and the East Indies. The crested eagle (*M. cristatus*) of Guiana, and the Brazilian eagle, or urubitinga (*M. urubitinga*), may be mentioned as examples. The latter, although not so large as a goose, is sometimes called the Brazilian eagle.

EAGLE OWL, *Bubo*, a genus of the owl (q.v.) family (*strigidæ*), characterized by a somewhat incomplete facial disk, two tufts of feathers (*horns* or *egrets*) of considerable size on the head, ears with small openings (*conchs*), legs and toes covered with feathers, short strong curved bill, and long curved sharp claws. To this genus belong the largest of the nocturnal birds of prey. The E. O. of Europe (*B. maximus*) is little inferior in size to the golden eagle, and preys on quadrupeds such as hares, rabbits, and young deer, and on grouse, partridges, and other kinds of game. It seizes its prey with its feet, and seldom touches it with the bill till its struggles are over. It is an inhabitant of many parts of Europe and Asia, but it is only a rare occasional visitor in Britain. The loud peculiar cry of this bird, resounding strangely through the night, has obtained for it its German name of *uhu*, and an intimate association from time immemorial with evil omens and superstitious terrors.—The E. O. of America (*B. Virginianus*), the VIRGINIAN HORNED OWL or GREAT HORNED OWL, is very similar to the species just noticed, but of inferior size, although still a large and powerful, as it is also a bold bird. It does not scruple to attack half-grown turkeys, and often succeeds in making them its prey. It carries off with ease almost any other inhabitant of the poultry-yard. It is found in almost all parts of America.

EAGLE WOOD, an East India tree of which there are three varieties, containing much resin, and an oil which the natives esteem highly as a perfume or incense. Some of the trees are naturally inodorous, but after a disease which often attacks them the wood becomes colored and gives out a powerful scent. It is supposed to be a cure for gout, and in Europe is sometimes prescribed for rheumatic affections.

EA GRE, another name for the bore (q.v.) in tidal rivers.

EAR, THE, ANATOMY AND PHYSIOLOGY OF. The apparatus of hearing, as it exists in man and the mammalia, is composed of three parts—the external ear, the middle ear or tympanum, and the internal ear or labyrinth.

The *external ear* consists of two portions, the *auricle* or *pinna* (the part popularly recognized as the ear), and the *auditory canal* or *external meatus*.

The *auricle*, on its outer or more exposed surface, presents various eminences and depressions, resulting from the form of its cartilaginous frame-work. These have received special anatomical names, to which it is unnecessary to advert further than to mention that the deep capacious central space to which several grooves converge, is termed the *concha*, and that the lowest and pendulous portion of the ear is termed the *lobe*. The cartilage forming the basin of the external ear consists of one principal piece, in which there are several fissures, which are filled up by fibrous membrane. Several muscles are described as passing from one part of the auricle to another, but they are so little developed in man that they do not require notice; there are additionally three muscles—the *attollens aurem* (or *superior auris*), the *attrahens aurem* (or *anterior auris*), and the *retrahens aurem* (or *posterior auris*), which pass from adjacent parts of the scalp to the E., and which, though more developed than the previous group, are of little or no real importance in man (at least in his civilized state), but are of considerable use in many mammals. Their actions are sufficiently indicated by their names.

The auditory canal passes from the *concha* inwards, and a little forwards, for rather more than an inch. It is narrower at the middle than at either extremity; and on this account there is often considerable difficulty in extracting foreign bodies that have been inserted into it. The membrane of the tympanum which terminates it is placed obliquely, in consequence of the lower surface of the meatus being longer than the upper. The canal is partly cartilaginous and partly osseous; the osseous portion consisting in the fœtus of a ring of bone, across which the membrane is stretched, and in many animals remaining persistently as a separate bone. The orifice of the meatus is concealed by a pointed process, which projects from the facial direction over it like a valve, and which is called the *tragus*, probably from being sometimes covered with bristly hair like that of a goat (*tragos*); and it is further defended by an abundance of ceruminous glands, which furnish an adhesive, yellow, and bitter secretion (see CERUMEN), which entangles small insects, particles of dust, and other small foreign bodies, and prevents their further passage into the meatus.

The *middle ear*, or *cavity of the tympanum*, is a space filled with air which is received from the pharynx (q.v.) through the Eustachian tube, and traversed by a chain of very small movable bones, which connect the membrane of the tympanum with the internal ear. It lies, as its name implies, between the external meatus and the labyrinth or internal E., and opens posteriorly into the cells contained in the mastoid portion of the temporal bone, which are also filled with air, and anteriorly into the Eustachian tube. The cavity is of an irregular shape, and is lined by a very delicate ciliated epithelium, which is a prolongation of that of the pharynx through the Eustachian tube.

Its external wall is mainly formed by the membrane of the tympanum, which is nearly oval, and placed in a direction slanting inwards, so as to form an angle of about 45° with the floor of the auditory canal. The handle of the malleus (or hammer), the first of the chain of ossicles, is firmly attached to the inner side of this membrane in a vertical direction as far downwards as the center, and by drawing it inwards, renders its external surface concave.

Its internal wall has two openings communicating with the internal E., each of which is closed by a delicate membrane. These openings are termed, from their respective shapes, the *fenestra ovalis*, and the *fenestra rotunda*; the former leads to the vestibule, and is connected by its membrane with the base of the stapes (or stirrup-bone), the last of the chain of ossicles; while the latter opens into the cochlea.

The ossicles of the tympanum are three—viz., the *malleus*, the *incus* (or anvil), and the *stapes*. We have already explained how the malleus is connected with the membrane of the tympanum by means of its handle. Through this connection, the tension of that membrane may be modified by the agency of one or two muscles which are attached to this ossicle. These muscles are the *laxator tympani*, which arises from the spinous process of the sphenoid bone (q.v.), and is inserted into the *processus gracilis*; and the *tensor tympani*, which arises from the under surface of the petrous portion of the temporal bone, and is inserted into the handle of the malleus immediately below the commencement of the *processus gracilis*. The existence of the former of these muscles is doubtful, many anatomists regarding the structure in question as ligamentous rather than muscular. The *incus* much more closely resembles a molar tooth with two fangs, than the anvil from which it derives its name. Of the two processes which it gives off, the short one runs backwards, and projects into the mastoid cells behind the tympanic cavity; while the long one inclines downwards, and terminates in the lenticular or orbicular process, to which the head of the stapes is attached. It has a head, neck, two branches, and a base, which, as has been already mentioned, fits into the *fenestra ovalis*. A minute muscle, the *stapedius*, takes its origin from a hollow conical eminence termed the *pyramid*, which lies behind the *fenestra ovalis*, and is inserted into the neck of the

stapes; by pulling the neck backwards, it probably compresses the contents of the vestibule.

The Eustachian tube, into which the tympanic cavity opens anteriorly, is about an inch and a half in length, and passes downwards, forwards, and inwards to its opening in the pharynx. It is partly bony, but chiefly cartilaginous. Its use is to allow the free passage of air in and out of the tympanum, and to admit of the egress of the mucus secreted in that cavity.

The *internal ear* or *labyrinth* is the essential part of the organ of hearing, being the portion to which the ultimate filaments of the auditory nerve (q.v.) are distributed. It is composed of three parts—viz., the *vestibule*, the *semicircular canals*, and the *cochlea*, which form a series of cavities presenting a very complicated arrangement, and lying imbedded in the hardest part of the petrous portion of the temporal bone. They communicate externally with the tympanum by the two openings already described—the *fenestra ovalis*, and the *fenestra rotunda*; and internally with the internal auditory canal, which conveys the auditory nerve from the cranial cavity to the internal ear. The very dense bone immediately bounding these cavities is termed the *osseous labyrinth*, to distinguish it from the *membranous labyrinth*, which lies within a portion of it.

The *vestibule* is a common central cavity into which the semicircular canals and the cochlea open. It is about a fifth of an inch in height, and in length from before backwards its transverse diameter (from side to side) being somewhat less. On its posterior wall are five orifices for the semicircular canals, one of the orifices being common to two of the canals. Anteriorly, the cochlea enters it by a single opening, the beginning of the *scala vestibuli*. On its outer wall is the *fenestra ovalis*, and on its inner are the *fovea hemispherica*, containing several minute orifices for the entrance of filaments of the auditory nerve, and the *fovea semi-elliptica*.

The *semicircular canals* are three in number, and open at both ends into the vestibule. They vary in length, and notwithstanding their name, each is considerably more than a semicircle, the superior vertical canal being the longest. Their average diameter is about a twentieth of an inch, the extremity of each canal exhibiting a dilatation or *ampulla*. Each canal lies in a different plane, very nearly at right angles to the planes of the other two, hence their names of the *superior vertical*, the *inferior vertical*, and the *horizontal* canals.

The *cochlea*, which derives its name from its resemblance to a common snail-shell, forms the anterior portion of the labyrinth. It consists of an osseous and gradually tapering canal, about an inch and a half in length, which makes two turns and a half spirally around a central axis, termed the *modiolus*, which is perforated at its base for the entrance of the filaments of the cochlear portion of the auditory nerve. This spiral canal gradually diminishes towards the apex of the cochlea. At its base, it presents two openings, one into the vestibule, and the other (closed by a membrane, and communicating with the tympanum) being the *fenestra rotunda* already described. Its interior is subdivided into two passages (*scalæ*) by an osseo-membranous lamina. This is the *lamina spiralis*, which divides the cochlea into an upper passage, the *scala vestibuli*, and a lower one, the *scala tympani*. At the apex, these two passages communicate by an opening to which the term *helicotrema* has been applied. Between the two *scalæ*, there is a third space termed the *ductus cochlearis*, or *scala intermedia*. In this space the filaments of the auditory nerve terminate, by being connected with a complicated arrangement of peculiarly formed epithelial cells, constituting the organ of corbi. For a notice of the membranous portion of the *lamina spiralis*, see AUDITORY NERVE.

We now return to the *membranous labyrinth*. The membranous and osseous labyrinths have the same shape, but the former is considerably smaller than the latter, a fluid, termed the *perilymph*, intervening in some quantity between them. At certain points, recent investigations have shown that the membranous is firmly adherent to the inner surface of the osseous labyrinth. The vestibular portion consists of two sacs, an upper and larger one, of an oval shape, termed the *utricle*, or *common sinus*, and a lower and smaller one of a more globulous shape, called the *sacculus*.

The membranous semicircular canals resemble in form and arrangement the osseous canals which inclose them, but are only one third of the diameter of the latter. The ultimate filaments of the auditory nerve (q.v.) mainly go to the utricle, to the sacculus, and to the ampulla of the canals.

The membranous labyrinth is filled by a fluid which is termed the *endolymph*; and in certain spots, especially at the terminations of the vestibular nerves, we observe, both in man and the lower animals, calcareous matter either in a powdered or solid form. In man and mammals generally, and in birds and reptiles, it occurs as a powder, and is termed *otoconia* or *ear-powder*, and it always consists of carbonate of lime.

We now proceed to consider the different functions or offices of the various parts of the organs of hearing.

1. *Of the External Ear.*—A true auricle only exists in the mammalia, and in this class it varies from little more than an irregularly-shaped cartilaginous disk, with little or no motion, as in man and the quadrumana, to an elongated funnel-shaped ear-trumpet, movable in all directions by numerous large muscles, as in the horse, the ass, and the bat.

The mode in which we see it employed by those animals in which it is highly

developed, sufficiently indicates that its main function is to collect and concentrate the sounds which fall upon it. But the experimental investigations of Savart, with an apparatus constructed to resemble the tympanic membrane and the external auditory apparatus, show that these parts are also adapted to enter into vibrations in unison with those of the air; and he suggested that the human auricle, by the various directions of different parts of its surface, could always present to the air a certain number of parts whose direction is at right angles with that of the molecular movement of that fluid, and therefore is the most favorable position for entering into vibrations with it.

2. *Of the Tympanum and its Contents.*—Savart's experiments show that the membrane of the tympanum is thrown into vibration by the air, and that it always executes vibrations equal in number to those of the sonorous body which excites the oscillations in the air. He further ascertained that the malleus participates in the oscillations of the tympanic membrane, and that these vibrations are propagated to the incus and stapes, and thus to the membrane of the fenestra ovalis. The malleus has further the office of regulating, through the *tensor tympani* muscle, the tension of the tympanic membrane; and to allow of the motion necessary for this purpose, we find movable joints between it and the incus, and again between the latter bone and the stapes. The contraction of the stapedius muscle similarly modifies the tension of the membrane of the *fenestra ovalis*; and as compression exercised on this membrane extends to the perilymph, and is propagated through it to the *fenestra rotunda*, the tension of the membrane of the latter opening is also influenced by the muscle in question. The incus is much more limited in its motions than either of the other bones, and its use seems to be to complete the chain of ossicles in such a manner as to prevent any sudden or violent tension of the membranes, such as we can easily conceive might occur, if the conductor between the membranes were a single bone. The presence of air in the tympanic cavity serves a double purpose: in the first place, it preserves a uniform temperature on the outer surfaces of the fenestral membranes, and thus supports a fixed elasticity in them, which would not be the case if they were freely exposed to ordinary atmospheric changes; and secondly, the action of the chain of ossicles as conductors of sound is materially increased by their being completely surrounded by air, as is obvious from the first principles of acoustics.

3. *Of the Labyrinth.*—Sound is conducted to the labyrinth in three ways: first, by the chain of bones; secondly, by the air in the tympanic cavity; and thirdly, through the bones of the head.

Müller has shown, by very ingenious experiments on an apparatus constructed to resemble, on a large scale, the middle and internal E., that while the air in the tympanum conducts sound to the cochlea, through the *fenestra rotunda*, the chain of bones forms a much better conductor of it to the vestibule, through the *fenestra ovalis* (see the chapter on hearing in his *Physiology*). Hence, we infer that the vestibule is adapted to receive sounds from the membrane of the tympanum and the external E., while the cochlea, on the other hand, as its structure and connections indicate, may be regarded as that part of the labyrinth which is specially affected by sounds communicated through the bones of the head.

That the vestibule is the essential or fundamental part of the organ of hearing, is sufficiently proved by its constancy, other parts gradually disappearing as we descend the animal scale, and by its central position in the ears of the higher animals. The use of the otoconia or ear-powder is to strengthen the sonorous undulations, and to communicate to the membranous vestibule and ampullæ, and to their nerves, stronger impulses than the perilymph alone could impart. The action of otoliths or ear-stones, such as occur in osseous fishes, must be still more decided, and is well illustrated by the following experiment of Camper: Fill a bladder with water, and place a pebble in it. The slightest impulse communicated to the bladder disturbs the pebble, which consequently produces a greater impression on the hand supporting the bladder than the water alone could do.

Nothing certain is known regarding the functions of the semicircular canals, but their constant existence and number* in the vertebrate animals indicate their importance; and in most cases of congenital deafness they are more or less defective. The fact of their position corresponding with the three dimensions of a cube—namely, its length, breadth, and height—has led to the opinion that they are concerned in conveying a knowledge of the direction of sounds. This view is supported by prof. Wheatstone, who believes that we distinguish best the direction of those sounds which are sufficiently intense to affect the bones of the head, and that it is from the vibrations which are transmitted through these bones that our perception of direction is obtained. Thus, if the sound be transmitted in the plane of any one canal, the nervous matter in that canal will be more strongly acted on than in either of the other two; or if it be transmitted in a plane intermediate between the planes of this canal and the adjacent one, the relative intensity with which these two canals will be affected will depend upon, and indicate the direction of the intermediate plane.

The range of hearing, like that of vision, varies remarkably in different persons.

* The only exceptions that we can call to mind are those presented by the myxine or hag and the lamprey—the former has only one, the latter two, semicircular canals. Both are fishes of very low organization.

Some persons are insensible to sounds which others can readily hear. The ordinary range of human hearing comprised between the lowest notes of the organ and the highest known sound emitted by insects includes, according to Wollaston, more than nine octaves, the whole of which are distinctly perceptible by most ears. He relates, however, several cases in which the range, in reference to the perception of high notes, was much less. In one individual, the sense of hearing terminated at a note four octaves above the middle E of the pianoforte, the F above it being inaudible, although his hearing in other respects was as perfect as that of persons in general; another case was that of a lady who could never hear the chirping of the field-cricket; and in a third case the chirping of the common house-sparrow could not be heard. See his memoir on sounds inaudible by certain ears, *Phil. Trans.*, 1820.

The sensation of sound, like that of light, frequently lasts longer than the exciting cause. We have familiar proof of this fact in the noise which remains in the ears after a long journey in a coach or railway; and it was clearly demonstrated by Savart, who found, in his experiments on toothed wheels, that the removal of one tooth did not produce any interruption of the sound.

For diseases of the E., see DEAFNESS.

EAR, DISEASES OF THE. See DEAFNESS and OTITIS.

EAR, in music, is a figurative expression, meaning the possessing of a sensitive, just, and delicate appreciation of sound and measure.

EAR-COCKLES, PURPLES, or PEPPER-CORN, a disease in wheat, owing to the presence of *vibrio tritici*, one of the *infusoria*. This is an animal of worm-like form, yellowish-white, slender, tapering towards the tail, and more suddenly attenuated to a point at the head. Its minute eggs are supposed to be introduced into the sap of the wheat from infected seed, and so to find their way to the flowers, where they are hatched in the germen; the infected grains become dark green, then black, rounded like small pepper-corns, and furrowed on the surface; the glumes spread open, and the awns become twisted; the grains are filled with a white cottony substance, which at once dissolves in water, liberating the *vibrio* in great numbers. Henslow calculates that 50,000 of the young *vibrio* might exist in a grain of wheat. If the wheat is dried, the *vibrio* becomes dormant, but retains its vitality in this state for six or seven years, and is ready to revive on the application of moisture.

EARL (Ang.-Sax. *eorl*—a corruption of *ealdor*). The distinctive name of the noble amongst the northern races was *eorl*, or *jarl*, as opposed to the mere freeman, the *ceorl*, or *karl*; from which latter name come the modern German word *kerl*, and the Scotch word *carl*. From indicating the whole noble class, the title of *eorl* among the Anglo-Saxons, and perhaps generally among the Teutonic nations, came at first probably to be limited to those who were *ealdors*, or *ealdormen*, by office—that is to say, to those who were appointed to be at once governors and judges over a certain district, and to whom, according to Kemble (*Saxons in England*, ii. p. 126), the titles of *dux*, *princeps*, and *comes* are indiscriminately applied by the Latin writers, the same officer being sometimes called by the one title, and sometimes by the other. Being thus limited to those who held the office of *ealdors*, the social not unnaturally came to be confounded with the official title, and hence the general error of tracing the word *earl* not to *eorl*, a noble, but to *ealdorman*, a title which Mr. Kemble prefers to translate by duke. The early relation which subsisted between the duke and the count has been explained under the former title. In Europe generally, it was not till the count came to be recognized as a subordinate officer to the duke, governing a district of the province committed to the latter, that the *earl* assumed the position of the governor of a county, by the name of which he was commonly known. The title of duke, if it had ever existed, early disappeared in England, and was not revived till the time of Edward III. After the Norman conquest, the French term count was substituted for *earl*; but it held its place only for a very short time as the title of the officer, though it has continued ever since to give a name to the district over which he presided, and a title to his wife. William the Conqueror, after the battle of Hastings, recompensed his chief captains by granting to them the lands and offices of the Saxon nobles; but by making the title of *earl* hereditary, he took, unintentionally perhaps, the first step towards changing it from a title of office to a title of dignity, and thus depriving it of substantial power. Deputies, *vice-comites*, or sheriffs, came necessarily to be appointed in all cases in which the *earl* was a minor, or otherwise incapacitated from discharging the duties of the office, till gradually the office itself passed to the deputy; the dignity alone, with the hereditary privilege of sitting as a legislator in the house of lords, remaining with the principal. The form of creation of an *earl* formerly was by the king girding on his sword, and placing his coronet on his head, and his mantle on his shoulders; but *earls* are now created by letters-patent; and it is not unusual for them to depart so far from the old notion of their being territorial officers, as to take as their titles their own names, with the prefix *earl*—e.g., *Earl Grey*, *Earl Spencer*, *Earl Russell*, etc. At present, the number of *earls*, including the peerages of Scotland and Ireland, exceeds 200. See **PEER**.

The **EARL'S CORONET** is a circle of gold, rising at intervals into eight pyramidal points, or spikes, on the tops of which are placed as many pearls, and which alternate with strawberry-leaves. See **CROWN**.

EARLE, PLINY, 1762-1832; b. Mass.; inventor of machinery for making cards (for carding wool), by which he reduced the labor of hours to as many minutes. He was more than usually well informed in science and literature.

EARLE, PLINY, b. Mass., 1809; son of Pliny the inventor; educated at a Quaker school in Providence; licensed to practice as a physician in 1837; in 1840, was resident physician in the insane hospital at Frankford, Penn.; in 1844, physician to the Bloomingdale (N. Y.) insane asylum; after 1849, visited all the important insane asylums in Europe; in 1853, became physician to the New York lunatic asylum. Among his publications are: *Marathon and Other Poems*; *Visit to Thirteen Asylums for the Insane in Europe*; *History, Description, and Statistics of the Bloomingdale Asylum*; *The Curability of Insanity* (1887); and many articles in the *American Journal of Insanity*. He d. in 1892.

EARLE, THOMAS, 1796-1849; b. Mass.; brother of Pliny the physician. When young he settled in Philadelphia, where he became a journalist and lawyer. He was active in the Pennsylvania constitutional convention in 1837, and is credited with having made the original copy of the new constitution. In 1840, the liberty party made him their candidate for vice-president, probably because he had broken away from the democratic party by advocating the extension of the right of suffrage to colored men. He published *Essay on the Penal Law*; *Essay on the Right of States to alter and annul their Charters*; *Treatise on Railroads and Internal Communication*; *Life of Benjamin Lundy*; and a school spelling-book. At the time of his death he was about finishing a history of the French revolution. In early life he edited the *Columbian Observer*; *Standard*; *Pennsylvanian*; and *Mechanics' Free Press and Reform Advocate*.

EARL MARSHAL, an office of great antiquity, and formerly of importance. There seems reason to believe that the marshal of England, afterwards the E. M., was a distinct officer from the marshal of the king's house, but the point is not altogether clear, and there is, consequently, some difficulty in determining which of the offices was held by the Mareschals, earls of Pembroke. For many generations the office has been hereditary in the family of the dukes of Norfolk, though the earls marshal having, to an unusual extent, had the fate to die either childless or without heirs-male, the line of descent has been by no means a direct one. The last grant is by king Charles II., and bears date 19th Oct., 1672. The E. M. presided jointly with the constable over the court of chivalry (q.v.), the last proceedings of which are said to have taken place in 1631. He is the head of the heralds' college (q.v.), which has jurisdiction in descents and pedigrees; determines all rival claims to arms; and he grants armorial bearings, through the medium of the kings-of-arms, to parties not possessed of hereditary arms. The office of the Lyon in Scotland is generally supposed to correspond to that of the E. M. in England, but not quite correctly. The Lyon having been subordinate to the E. M. in England; with this difference, that it extended to the whole kingdom.

EARLOM, RICHARD, an engraver, whose works in mezzotinto, published during the end of last and beginning of this century, are well known as amongst the best of the period when that kind of engraving was practiced without the admixture of etching, was b. in London, in 1743. His works after Reynolds, his plates from pictures in the Houghton gallery, and the *Liber Veritatis*, consisting of imitations of the celebrated drawings by Claude, in the possession of the duke of Devonshire, are standard works in their various departments. He died in 1822, having some time previously retired from his profession.

EARL'S PENNY, an English corruption for Arles penny. See EARNEST.

EARLSTON, or ERCLIDOUNE, a village in the s.w. of Berwickshire, on the Leader, a n. branch of the Tweed, 30 m. w.s.w. of Berwick. Pop. '91, less than 1500. E. has been and still is famed for its manufacture of gingham; it has also a factory for the manufacture of blankets, tweeds, etc. On the left bank of the Leader are the ruins of a building called "Rhymer's tower," as having been the residence of Thomas the Rhymer (q.v.), so famous in Scottish tradition. A mile s. of E. is Cowdenknowes, which is celebrated in song for its "bonny, bonny broom."

EARLY, a co. in s.w. Georgia, on the Alabama border, partially crossed by the Central Georgia railroad; 429 sq. m.; pop. '90, 9792, incl. colored. The surface is level and the soil fertile, producing corn, cotton, etc. The Chattahoochee, on the w. border, is navigable for steamboats. Co. seat, Blakeley.

EARLY, JUBAL ANDERSON, b. Va., 1816; graduated at West Point, 1837; served in the artillery in the Florida war. He resigned in 1838 to study law; became a member of the bar and of the Virginia legislature, and state attorney. In the war with Mexico he served as major and colonel. He was among the first to volunteer in the army of the confederacy, and at Bull Run was in command of a brigade. Two years later, he was brig.-gen., and had command of a division at Gettysburg. In 1864 he made a raid through the valley of the Shenandoah, invaded Pennsylvania, and partially burned Chambersburg. The tide of his success was turned by the union Gen. Sheridan, who defeated him at Opequan, at Fisher's Hill, and at Cedar Creek, and he was routed by

Cluster at Waynesborough. Popular feeling demanding it, he was removed from command in March, 1865. After a trip to Europe, he resumed the practice of law in Richmond. He published *A Memoir of the Last Year of the War for Independence in the Confederate States* (1867). He d. in 1894.

EARLY ENGLISH, the term generally applied to the form of Gothic in which the pointed arch was first employed in Gt. Britain. The early English succeeded the Norman towards the end of the 12th c., and merged into the decorated (q.v.) at the end of the 13th. Its characteristics are beautiful and peculiar. Retaining much of the strength and solidity of the earlier style, it exhibited the graceful forms, without the redundancy of ornament which latterly degenerated into a fault in that which followed. Generally, it may be said to bear to the decorated something like the relation which an expanding rosebud bears to a full-blown rose. The windows are long and narrow, and when gathered into a group, are frequently surmounted by a large arch, which springs from the extreme molding of the window on each side. The space between this arch and the tops of the windows is often pierced with circles, or with trefoils or quatrefoils, which constituted the earliest form of tracery. Each window, however, is generally destitute of any tracery in itself. "The moldings," says Parker, "in general consist of alternate rounds and deeply-cut hollows, with a small admixture of fillets, producing a strong effect of light and shadow."—*Gloss. of Architecture*. Circular windows, however, still continued to be used, and trifoliated archways over doors are also to be found, as at Salisbury cathedral. By far the most characteristic feature of the style is the tooth-ornament (q.v.), which is often used in great profusion. Where foliage is used, it is cut with great boldness, so as to throw deep shadows, and produce a very fine effect. The under-cutting is often so deep as to leave nothing to connect the leaves with the moldings but the stalks, and occasionally the edge or point of a leaf. The term E. E. is said, by Parker, to have been introduced by Mr. Millers in 1805. It corresponds to *Opiciale primitive* of French writers, and is very often known as the first pointed or lancet-arched amongst the English. See GOTHIC ARCHITECTURE.

EARN, a river and loch in the s. of Perthshire, in the finely-wooded, beautiful valley of Strathearn. Loch E. lies to the n. of Ben Voirlich; its eastern extremity is 24 m. w. of Perth. It is 7 m. long from e. to w., 1 m. broad, and 48 fathoms deep, and is surrounded by bold and rugged hills. The river E. flows e. from the loch 40 m. through the strath, past Comrie, Crieff, and bridge of E., into the estuary of the Tay, 7 m. s.e. of Perth. Along the river, near Abernethy, under a thick bed of clay, is a peat-bed 2 or 3 ft. thick, supposed to be a continuation of the submarine forest at Flisk.—The bridge of E., a much frequented village, stands on the right bank of the river, 6 m. s.s.w. of Perth, and near the saline springs of Pitcaithly.

EARNEST, or **ARLES**, as it is called in Scotland, from the civil law word *arrhæ*, is a small sum of money which is given, or a simple ceremony, such as shaking hands, which is performed in proof of the existence of that mutual consent which constitutes a contract. In the first case, the earnest is said to be pecuniary; in the second, symbolical. It is not the E., but the consent, i.e., the agreement to a certain price, that is the root of the bargain; and the E. thus becomes a mere adminicle of evidence, which may be dispensed with even in cases in which it is exacted by custom, if the parties choose to preserve other evidence of the completion of their bargain. The contracts in which E. has been most frequently given both in this country and elsewhere, are sale and service. In the case of sale, it usually consists of a small sum paid by the buyer, by the acceptance of which the seller is held to bind himself to the sale; in the case of service, it is a small sum given by the master, in accepting which the servant becomes bound to serve. The question as to whether the E. shall count as part of the price or wage depends on the intention of the parties, which, in the absence of direct evidence, will be inferred from the proportion which it bears to the whole sum. "If a shilling be given," as Mr. Erskine says, "in the purchase of a ship or of a box of diamonds, it is presumed to be given merely in evidence of the bargain, or, in the common way of speaking, is dead E.; but if the sum be more considerable, it is reckoned up in the price."—*Institutes*, b. iii. tit. iii. s. 5. The original view of E. in England was, that it was a payment of a small portion of the price or wage, in token of the conclusion of the contract (Story on *Sales*, p. 216); and as this view seems to have been adhered to, the sum, however small, would probably there be counted as a part payment. There is only one decision under the 17th section of the statute of frauds (29 Ch. II. c. 3), which provides that "no contract for the sale of any goods, wares, and merchandises, for the price of £10 sterling, or upwards, shall be allowed to be good, except the buyer shall accept part of the goods so sold; and actually receive the same, or give something in E. to bind the bargain, or in part payment." The case referred to "related to the purchase of a horse, where the purchaser produced a shilling from his pocket, and drew it across the hand of the seller's servant, and then returned it to his own pocket; and it was held that this act (which is a custom in the n. of England, and is called striking a bargain) was not sufficient to satisfy the requisitions of the statute."—Story, *ut sup.* From this decision it follows that no importance is attached in England to such fictitious ceremonies as the Jew plucking off his shoe and giving it to his neighbor, the Indian smoking his pipe, or the less poetical observance of thumb-licking, which Erskine tells us was common among the lower classes in Scotland in his day.

EAR-RING. A ring suspended from the ear, which is bored for the purpose. This mode of adorning the person has always enjoyed great favor amongst orientals. By Persians, Babylonians, Lydians, Libyans, and Carthaginians, ear-rings were worn by both sexes. In the classical nations of antiquity, their use was confined to women. In the *Iliad* (xiv. 182, 183), Juno is represented as adorning herself with ear-rings made with three drops resembling mulberries. From this period down to the latest, the practice prevailed in Greece, and we find the ears of the Venus de Medici pierced for the reception of ear-rings. Pliny says (xi. 50) that there was no part of dress on which greater expense was lavished amongst the Romans; and Seneca mentions an ear-ring which he says was worth a patrimony. It has four pearls, two above and two below the precious stone in the center. In the more valuable of the antique ear-rings, pearls were almost always used; and they were valued for the completeness of their form as well as for their whiteness. In place of a ring, the ornament was often attached to the ear with a hook, a custom which still prevails in Italy. Many Egyptian ear-rings of very beautiful design have been preserved. These antique designs have been imitated in modern times, and if the use of an ornament which seems fitter for a South sea islander than an English gentlewoman is to be continued, it can scarcely be made to assume a more graceful form than was often given to it by the ancients. See **RING**. During the reigns of Elizabeth and James I., ear-rings were worn in England by men; a custom which is still continued by many sailors. Master Matthew, in *Every Man in his Humor*, says to Brainworm: "I will pawn this jewel in my ear;" and Hall, in his *Satires* (B. vi. Sat. 1), speaks of the "ringed ear" of the new-come traveler and many similar passages to the like effect might be quoted. At the present day in America, ear-rings are worn only by women. The ears are bored usually at about 7 years of age. The boring, which produces a temporary inflammation, acts as a counter-irritant in cases of sore eyes; and this is sometimes given as a reason for putting rings in the ears.

EARS, a term in organ-building, given to small projecting pieces of metal on the sides of the mouths of metal pipes, put on for the purpose of assisting the pipes to speak promptly, especially when the organ is of small scale. The German name of "beard" is fully more appropriate.

EAR SHELL, *Halkotis*, a marine mollusk, of which the shell is used for inlaying and other ornamental purposes, and for decorating walls. They resemble the human ear in shape; are from 6 to 8 in. long, and 5 or 6 wide; are found in all temperate and tropical seas, and in some countries are used for food, being obtained at low tide in deep water, where they are found adhering to the rocks. There are about 75 living species, and a few fossils have been found.

EARTH, THE, the globe on which we live, being the third planet in order from the sun, and the largest within the belt of the planetoids. We proceed to consider briefly the points of chief interest connected with it, and which do not fall to be treated under separate heads, viz., 1. Its form and magnitude; 2. Its mass and density; 3. Its motions; 4. Its temperature.

1. *The Form and Magnitude of the Earth.*—To a spectator so placed as to have an unobstructed view all round, it appears a circular plain, on whose circumference the vault of heaven seems to rest. Accordingly, in ancient times, even philosophers looked long upon the earth as a flat disk swimming upon the water. But many appearances were soon observed to be at variance with this idea, and even in antiquity, the spherical form of the E. began to be suspected by individuals. It is only by assuming the E. to be spherical, that we can explain how our circle of vision becomes wider as our position is more elevated; and how the tops of towers, mountains, masts of ships, and the like, come first into view as we approach them. There are many other proofs that the E. is a globe. Thus, as we advance from the poles towards the equator, new stars, formerly invisible, come gradually into view; the shadow of the E. upon the moon during an eclipse is always round; the same momentary appearance in the heavens is seen at different hours of the day in different places on the E.'s surface; and lastly, the E., since 1519, has been circumnavigated innumerable times. The objection to this view that readily arises from our unthinking impressions of up and down, which immediately suggest the picture of the inhabitants of the opposite side of the E.—our *antipodes*—with their heads downwards, is easily got over by considering that on all parts of the earth's surface *down* is towards the E.'s center.

It is not, however, strictly true that the E. is a sphere; it is slightly flattened or compressed at two opposite points—the poles—as has been proved by actual measurement of degrees of latitude, and by observations of the pendulum. It is found that a degree of a meridian is not everywhere of the same length (see **DEGREE OF LATITUDE**), as it would be if the E. were a perfect sphere, but increases from the equator to the poles; from which it is rightly inferred that the E. is flattened there. A pendulum, again, of a given length is found to move faster when carried towards the poles, and slower when carried towards the equator, which shows that the force of gravity is less at the equator than at the poles, or, in other words, that the center, the seat of gravity, is more distant at the former than at the latter. The diminished force of gravity at the equator has, it is true, another cause, namely, the centrifugal force arising from the rotation of the E., which acts counter to gravitation, and is necessarily greatest at

the equator, and gradually lessens as we move northwards or southwards, till at the poles it is nothing. But the diminution of the force of gravity at the equator arising from the centrifugal force amounts to only $\frac{1}{289}$ of the whole force; while the diminution indicated by the pendulum is $\frac{1}{157}$. The difference, or $\frac{1}{540}$ nearly, remains assignable to the greater distance of the surface from the center at the equator than at the poles. From the most accurate measurements of degrees that have been made, the flattening or ellipticity of the E. has been determined by Bessel at $\frac{1}{230.155}$, or $\frac{1}{230}$ nearly; or, the equatorial radius is to the polar as 300 to 299. These measurements of degrees determine not only the shape but the size of the earth. Bessel's calculations give a geographical mile, or the 60th part of a mean degree of the meridian, at 951.807 toises (2,029 yards, thus making the whole circumference 43,536,400 yards), and the equatorial and polar diameters at 6,875.6 and 6,855.2 geographical m. (7,925.6 and 7,899.14 English imperial miles). The surface of the E. contains nearly 150 millions of square geographical miles.

2. *The Mass and Density of the Earth.*—We have now seen that the E. is a sphere slightly flattened at its poles—what is called by geometers an elliptical spheroid—of a mean radius of somewhat less than 4,000 miles. We have next to consider its mass and density. Nothing astonishes the young student more than the idea of weighing the E.; but there are several ways of doing it; and unless we could do it, we never could know its density. (1.) The first method is by observing how much the attraction of a mountain deflects a plummet from the vertical line. This being observed, if we can ascertain the actual weight of the mountain, we can calculate that of the earth. In this way, Dr. Maskelyne, in the years 1774–76, by experiments at Schiathallion, in Perthshire, a large mountain mass lying e. and w., and steep on both sides—calculated the E.'s mean density to be five times greater than that of water. The observed deflection of the plummet in these experiments was between 4" and 5". (2.) In the method just described, there must always be uncertainty, however accurate the observations, in regard to the mass or weight of the mountain. The method known as *Cavendish's experiment* is much freer from liability to error. This experiment was first made by Henry Cavendish on the suggestion of Michel, and has since been repeated by Reich of Freyberg, and Mr. Francis Baily. In the apparatus used by Mr. Baily two small balls at the extremities of a fine rod are suspended by a wire, and their position carefully observed by the aid of a telescope. Large balls of lead placed on a turning-frame, the center of which is in the prolongation of the suspending wire, are then brought near them in such a way that they can affect them only by the force of their attraction. On the large balls being so placed, the small ones move towards them through a small space, which is carefully measured. The position of the large balls is then reversed—i.e., they are placed at the same angular distance on the other side of the small balls—and the change of position of the small balls is again observed. Many observations are made, till the exact amount of the deviation of the small balls is ascertained beyond doubt. Then by calculation the amount of attraction of the large balls to produce this deviation is easily obtained. Having reached this, the next question is, what would their attraction be if they were as large as the earth? This is easily answered, and hence, as we know the attractive force of the E., we can at once compare its mean density with that of lead. Mr. Baily's experiments lead to the result that the E.'s mean density is 5.67 times that of water. (3.) A third mode has lately been adopted by the astronomer-royal, by comparison of two invariable pendulums, one at the E.'s surface, the other at the bottom of a pit at Harton colliery, near Newcastle, 1260 ft. below the surface. The density of the E., as ascertained from this experiment, is 6 and 7 times that of water; but for various reasons this result is not to be accepted as against that of the Cavendish experiment, and it is said that the astronomer-royal was himself dissatisfied with it, and meant to repeat the experiment with new precautions. The density of the E. being known, its mass is easily calculated, and made a unit of mass for measuring that of the other bodies in the system. It is found that the mass of the E. compared with that of the sun is .000028173.

3. *The Motions of the Earth.*—The E., as a member of the solar system, moves along with the other planets round the sun from w. to east. This is contrary to our sensible impressions, according to which the sun seems to move round the E.; it was not till a few centuries ago that men were able to get over this illusion. See COPERNICAN SYSTEM. This journey round the sun is performed in about 365 $\frac{1}{4}$ days, which we call a year (solar year). The E.'s path or orbit is not strictly a circle, but an ellipse of small eccentricity, in one of the foci of which is the sun. It follows that the E. is not equally distant from the sun at all times of the year; it is nearest, or in perihelion, at the beginning of the year, or when the northern hemisphere has winter; and at its greatest distance, or aphelion, about the middle of the year, or during the summer of the northern hemisphere. The difference of distance, however, is comparatively too small to exercise any perceptible influence on the heat derived from the sun, and the variation of the seasons has a quite different cause. The least distance of the sun from the E. is over 92 millions of miles, and the greatest over 96 millions; the mean distance is commonly stated at 95 millions of miles. If the mean distance be taken as unity, then the greatest and least are respectively represented by 1.01679, and 0.98321. It follows that the E. yearly describes a path of upwards of 580 millions of miles, so that its velocity in its orbit is about 18 m. in a second.

Besides its annual motion round the sun, the E. has a daily motion or rotation on its axis, or shorter diameter, which is performed from w. to e., and occupies exactly 23 hours, 56 minutes, 4 seconds of mean time. On this motion depend the rising and setting of the sun, or the vicissitudes of day and night. The relative lengths of day and night depend upon the angle formed by the E.'s axis with the plane of its orbit. If the axes were perpendicular to the plane of the orbit, day and night would be equal during the whole year over all the E., and there would be no change of seasons; but the axis makes with the orbit an angle of $23\frac{1}{2}^{\circ}$, and the consequence of this is all that variety of seasons and of climates that we find on the E.'s surface; for it is only for a small strip (theoretically, for a mere line) lying under the equator that the days and nights are equal all the year; at all other places, this equality only occurs on the two days in each year when the sun seems to pass through the celestial equator, i.e., about the 21st of Mar., and the 23d of September. From Mar. 21, the sun departs from the equator towards the n., till, about June 21, he has reached a n. declination of $23\frac{1}{2}^{\circ}$, when he again approaches the equator, which he reaches about Sept. 23. He then advances southward, and about Dec. 21, has reached a s. declination of $23\frac{1}{2}^{\circ}$, when he turns once more towards the equator, at which he arrives, Mar. 21. The 21st of June is the longest day in the northern hemisphere, and the shortest in the southern; with the 21st of Dec. it is the reverse.

The velocity of the E.'s rotation on its axis evidently increases gradually from the poles to the equator, where it is about equal to that of a musket-ball, being at the rate of 24,840 m. a day, or about 1440 ft. in a second.

A direct proof of the rotation of the E. is furnished by its compression at the poles. There are indubitable indications that the E. was originally fluid, or at least soft; and in that condition it must have assumed the spherical shape. The only cause, then, that can be assigned for the fact that it has not done so, is its rotation on its axis. Calculation also shows that the amount of compression which the E. actually has, corresponds exactly to what its known velocity and mass must have produced. Experiments with the pendulum, too, show a decrease of the force of gravity from the poles towards the equator; and though a part of this decrease is owing to the want of perfect sphericity, the greatest part arises from the centrifugal force caused by the motion of rotation. Another direct proof of the same hypothesis may be drawn from the observation that bodies dropped from a considerable height deviate towards the e. from the vertical line. This fact has been established by the experiments of Benzenberg and others. In former times, it was believed that if the E. actually revolved in the direction of e., a stone dropped from the top of a tower would fall, not exactly at the foot of the tower, but to the w. of it. Now, as experience, it was argued, shows that this is not the case—that the stone, in fact, does fall at the bottom—we have here a proof that the pretended rotation of the E. does not take place. Even Tycho Brahé and Riccioli held this objection to the doctrine to be unanswerable. But the facts of the case were just the reverse. Newton, with his wonted clearness of vision, saw that, in consequence of the E.'s motion from w. to e., bodies descending from a height must decline from the perpendicular, not westward, but eastward; since, by their greater distance from the E.'s center, they acquire at the top a greater eastward velocity than the surface of the E. has at the bottom, and retain that velocity during their descent. He therefore proposed that more exact observations should be made to ascertain the fact; but it was not till more than a century afterwards that experiments of sufficient delicacy were made to bring out the expected result satisfactorily. It is difficult to find an elevation sufficiently great for the purpose, as several hundred feet give merely a slight deviation, which it requires great accuracy to observe. If a height of 10,000 ft. could be made available, the deviation would be not less than $7\frac{1}{2}$ feet. The analogy of our E. to the other planets may also be adduced, the rotation of which, with the exception of the smallest and the most distant, is distinctly discernible. Finally, an additional proof of the E.'s rotation was lately given by Léon Foucault's striking experiment with the pendulum. The principle of the experiment is this: that a pendulum once set in motion, and swinging freely, continues to swing in the same plane, while at any place at a distance from the equator the plane of the meridian continues to change its position relative to this fixed plane.—The objection taken to the doctrine of rotation from the fact that we are unconscious of any motion, has little weight. The movement of a vessel in smooth water is not felt, though far less uniform than that of the E.; and as the atmosphere accompanies the E. in its motion, there is no feeling of cutting through it to break the illusion of rest.

If the turning of the E. on its axis is thus proved to be the cause of the apparent daily motion of the heavens, it is an easy step to consider the annual motion of the sun through the constellations of the zodiac as also apparent, and arising from a revolution of the E. about the sun in the same direction of w. to east. If we consider that the mass of the sun is about 359,000 times greater than that of the E., and that by the laws of mechanics, two bodies that revolve round each other, must revolve about their common center of gravity, the idea of the sun revolving about the E. is seen to be simply impossible. The common center of gravity of the two bodies being distant from the center of each inversely as their respective masses, is calculated to be only 267 m. from the center of the sun, and therefore far within his body, which has a diameter of

882,000 miles. But by help of a figure, it is easy to show that the apparent motion of the sun on the ecliptic naturally arises from a motion of the E. about the sun. The motions of the planets also, that appear so complicated and irregular as seen by us, can only be satisfactorily explained by assuming that they too revolve round the sun in the same direction as the earth. See PRECESSION and NUTATION for an account of a small periodic motion of the E.'s axis and its effects.

4. *The Earth's Temperature.* See CLIMATE; METEOROLOGY as to the phenomena of heat on the E.'s surface. As we go below the surface, we reach a depth beyond which the interior of the E. seems to have no sympathy with the external causes of heat or cold, and its heat appears to be its own, and to increase according to a fixed law the deeper we descend. The average rate of observed increase is 1° F. for a descent of between 40 and 50 feet. If this law were universal—which we do not know it to be—at a depth of less than 30 miles the heat would be such as to hold in fusion all known substances, and the E. would have to be regarded as a very thin crust or shell full of molten liquid. This theory of a molten interior obtained at one time extensive currency among philosophers, being indorsed with the names of Fourier and Humboldt; but it has since been shown to be inconsistent with the rigidity which astronomical observations prove the E. to possess. A liquid nucleus would be subject to tides like the ocean, and the crust would partake of the motion. Granting the increase of heat to be constant, we do not know what effect the increasing pressure may have in preventing fusion.

EARTH-CLOSET. See SEWAGE EARTH-CLOSET.

EARTHENWARE. See POTTERY.

EARTH-HOUSES, EIRD-HOUSES, or YIRD-HOUSES, the name which seems to have been generally given throughout Scotland to the under-ground buildings which in some places are called also "*Picts' houses*" (q.v.), and in others, it would appear "*weems*," or caves. Martin, in his *Description of the Western Islands*, printed in 1703, when their use would appear to have been still remembered, speaks of them as "*little stone-houses built under ground, called earth-houses, which served to hide a few people and their goods in time of war.*" The earth-house, in its simplest form, is a single, irregularly shaped chamber, from 4 to 10 ft. in width, from 20 to 60 ft. in length, and from 4 to 7 ft. in height, built of unhewn and uncemented stones, roofed by unhewn flags, and entered from near the top by a rude doorway, so low and narrow that only one man can slide down through it at a time. When the chamber is unusually wide, the side-walls converge, one stone overlapping another, until the space at the top can be spanned by stones of 4 or 5 ft. in length. In its more advanced form, the earth-house shows two or more chambers, communicating with one another by a narrow passage. There are instances in which one of the chambers has the circular shape and dome-roof to which archæologists have given the name of the "*Beehive-house*" (q.v.). Occasionally, as many as forty or fifty earth-houses are found in the same spot, as in the moor of Clova, not far from Kildrumny, in Aberdeenshire. They appear to have been almost invariably built in dry places, such as gravelly knolls, steep banks of rivers, and hill-sides. They are generally so near the surface of the ground that the plow strikes upon the flagstones of the roof, and thus leads to their discovery. The object most frequently found in them is a stone quern, or hand-mill, not differing from that which continued to be used in remote corners of Scotland within the memory of living men. Along with the quern are generally found ashes, bones, and deer's horns; and more rarely small round plates of stone or slate, earthen vessels, cups and implements of bone, stone celts, bronze swords, gold rings, and the like. Occasionally the surface of the ground beside the earth-house shows vestiges of what are supposed to have been rude dwelling-houses, and folds or inclosures for cattle. This, with other things, would indicate that the earth-houses of Scotland and Ireland (for they are found also in that island) were put to the same purpose as the caves which, as Tacitus (writing in the 2d c.) tells us, the Germans of his day dug in the earth, as storehouses for their corn, and as places of retreat for themselves during winter or in time of war.

EARTH-NUT, a popular name for the tubers of certain umbelliferous plants, particularly *bunium bulbocastanum* and *B. flexuosum*, which are common in most parts of Europe. Names of the same signification are given to them in a number of European languages. *Arnut*, *yernut*, and *jurnut*, Scotch and English provincial names, are corruptions of earth-nut. **PIG-NUT** is another common English name, pigs being very fond of these tubers, grubbing up the ground in quest of them, and soon becoming fat upon them. They are also called *earth-chestnut*, from their resemblance in taste and qualities to chestnuts, perhaps also from their resemblance in size, and their being black or very dark brown externally, and white within. By some they are preferred to chestnuts, and they are much used for food in different parts of Europe, and occasionally in some parts of England, either roasted or in soups. They are wholesome and nutritious; they form an article of trade in Sweden, and have sometimes been recommended as worthy of an attention which they have never yet received in Britain. The two species are very similar in general appearance, although *B. bulbocastanum* has by some botanists been referred to the genus *carum* (caraway), because its carpels have single vittæ between the ribs, whilst *B. flexuosum* has three. The former is also a plant of stouter habit.

Both have umbels of small white flowers, much divided leaves with very narrow segments, and a single roundish tuber at the foot of each plant. *B. flexuosum* is common in woods, pastures, waysides, etc., in most parts of Britain. *B. bulbocastanum* is found only in some of the chalk districts of England, but is abundant in many parts of Europe. *B. ferulaceum* likewise affords tubers, which are used as food in Greece.—The somewhat similar tubers of another umbelliferous plant, *oenanthe pimpinelloides*, which grows in the pastures of some parts of the s. of England, are sometimes also used for food, notwithstanding the very poisonous qualities of some of its congeners. See WATER-DROPWORT.—A Himalayan umbelliferous plant (*cheerophyllum tuberosum*), a species of chervil (q. v.), yields edible tubers or *earth-nuts*.—The name earth-nut is sometimes extended to other small tuberous roots of similar quality, although produced by plants widely remote in the botanical system, as *apios tuberosa* and *lathyrus tuberosus*.

EARTH, POPULATION OF THE. See **POPULATION OF THE WORLD.**

EARTHQUAKE, the term applied to any tremor or shaking of the solid crust of the earth. The frequent occurrence of earthquakes, their destruction to life and property, their influence upon the solid surface of the earth, and the mysteriousness of their cause, force them upon our attention. It is estimated that 12 or 13 earthquakes, destructive more or less of life and property, occur every year, and it is well known that the surface of the globe is never free from sensible evidence of the continued operation of E. agency—that in some quarter or another tremors or slight shakings are always taking place. When these are of a serious nature, whole cities have been destroyed; fertile districts, with all their fruits and grain, have been laid waste; and enormous masses of human beings have lost their lives. No less than 60,000 perished in the great Lisbon E.; while in that of Calabria, in the end of last century, 40,000 were destroyed. It is estimated that as many as 13,000,000 of the human race have thus perished! The great changes which earthquakes produce on the earth's surface deserve the careful attention of the geologist. They disclose to him an agency which seems to have been at work during every period of the earth's history, and which has altered the earth's surface to an extent that can scarcely be imagined. The observed results of earthquakes which more immediately demand his attention are such as these: the new lakes and river-courses which they form, at the same time obliterating the old ones; the new valleys which they hollow out; the fissures of various sizes they form; and the immense landslips they frequently produce. But the mysterious nature of the producing cause of earthquakes is also a strong incentive to their study. It is unfortunately true, that the most popular scientific inquiries are those in which the imagination has large play: dry inductions from observed phenomena are not suited to the genius of popular modern science. Consequently, earthquakes, where every attempt at explaining their origin is theoretical, from the impossibility of obtaining direct observation, affording as they do a wide field for the play of the poetic faculty, find plenty of students.

No portion of the earth's surface is exempt from the influence of earthquakes. Egypt has been less visited than perhaps any other country, but even here we have the record of one which took place in 1740 A. D.; and Holland, with its loose alluvial deposits, has also felt their power. Nor is the bed of the ocean exempt; records of many sub-aqueous earthquakes exist, taken by vessels at sea, sometimes passing over the point of greatest disturbance at the moment of the shock. In like manner earthquakes have been active at every period of the earth's existence, breaking up its solid crust, elevating or depressing its surface, and doing as much as any other single agent to bring it into its present condition. They have been probably at some periods more active than at others, just as we find that some districts are now more liable than others to their visitation. So well defined, indeed, are the localities where earthquakes occur, that it is easy to exhibit their limits on a map. They are most frequent around the present lines or centers of volcanic action (see **VOLCANO**); and their frequency and violence seem to bear some relation to the activity and intensity of the associated volcanoes. Observers of volcanic phenomena have noticed that every great eruption, in whatever part of the world observed, and whether from a volcanic vent on land or beneath the ocean, is accompanied by E. shocks of greater or less violence and duration; while, on the other hand, those observing earthquakes speak of them as accompanied by volcanic eruptions, and of their often being stopped on the opening of volcanic vents. It is, however, an important fact that, although regions of active volcanic action are those of most frequent E. movements, yet the most violent earthquakes do not appear to have occurred in these regions, but, on the contrary, in districts lying some degrees away from the nearest volcanic action, as, for instance, in the famous E. of Lisbon. Districts in which there are extinct volcanoes are not more liable to such visitations than non-volcanic regions.

The phenomena connected with earthquakes have been variously described. Many writers refer to appearances in the heavens, or changes in the atmosphere, which to them seem to have some connection with the catastrophes they narrate. They tell of irregularities in the season preceding or following the shock, of sudden gusts of wind interrupted by sudden calms, of violent rains at unusual seasons, or in countries where such phenomena are almost unknown, of a reddening of the sun's disk, of a haziness

in the air often continued for months, and similar phenomena. But these are so irregular in their appearance, and have been so seldom observed associated with more than a single E., that, in the absence of any decided reason to the contrary, there seem good grounds for believing they have no real connection with the earthquake. It is different with underground noises, which frequently precede, accompany, or succeed the occurrence of earthquakes, or some of the shocks of them. They are undoubtedly intimately connected with the shock, yet earthquakes occur, even of the greatest violence, which are unaccompanied by any sound whatever. Different descriptions have been given of these subterranean noises. In some earthquakes, they are likened to chains pulled about, increasing to thunder; in others, the sound is like the rumbling of carriages, growing gradually louder, until it equals the loudest artillery; or like heavy wagons running away upon a road; or distant thunder; or like the hissing produced by the quenching of masses of red-hot iron in water; or like the rush of wind underground. As there have been earthquakes without subterranean noises, so there are frequently, in South America and elsewhere, underground sounds which are not followed by earthquakes.

The more intimate earthquake-phenomena are more uniform. Sometimes there is nothing else felt than a trembling or gentle motion of the surface, without producing any injury. In severe earthquakes, the almost invariable succession of phenomena is first a trembling, then a severe shock, or a succession of shocks, and then a trembling, gradually becoming insensible. The violent shocks are instantaneous, and very few in number, sometimes only one, usually not more than three or four. In the intervals between these, smaller shocks or tremblings take place. The severe shocks do the mischief. At the point or line of greatest disturbance, the shock has a distinctly vertical direction, coming from below upwards. As we leave this point, the direction of the motion becomes more and more horizontal, gradually also decreasing in intensity until it becomes insensible. This progressive movement is produced by an earth-wave or true undulation of the solid crust of the earth. The whole mass of the area is not moved at once, but only the wave-crest. In the case of the earthquake at Lisbon, the progress of the wave was roughly calculated; it was shown to have had a very great velocity, and to have lasted only for an instant at any one spot. The area affected on this occasion was very extensive. The shock was felt on the one side as far as the southern shores of Finland, and on the other it reached beyond the St. Lawrence in Canada, and was observed in some of the West India islands—an area of no less than 7,500,000 sq. miles. The force required to move this must have been enormous, for, suppose the thickness of the earth's crust moved to have been no more than 20 m., then 150,000,000 cubic m. of solid matter was moved. The influence of this earth-wave is communicated to the sea, when the E. is near the shore, or on the bed of the ocean. The sea swells, and slightly retires from the beach, and then a great wave rolls in upon the shore. At the Lisbon E., this wave rose to a height of 60 ft. at Cadiz. It carries with it sea-spoil, scattering it over the surface of the earth, far beyond the ordinary reach of the sea.

Of the various theories as to the nature of earthquakes, we can only refer to the most important. All theorists are agreed as to the connection between volcanoes and earthquakes; that they are produced by the same subterranean agency. The existence of molten matter in the interior of the earth, is the starting-point in all except the chemical theory propounded by Davy, which, though in the end abandoned by him, still finds supporters. When he discovered the metallic bases of the earths and alkalies, he threw out the idea that those metals might abound in an unoxidized state in the subterranean regions, to which water must occasionally penetrate. When this occurred, gaseous matter would be set free, sufficient to produce the E., the metals would combine with the oxygen of the water, and heat enough would be evolved to melt the surrounding rocks.

Mr. Mallet, in an elaborate report on the subject presented to the British association, proposed an ingenious theory. He assumes that volcanoes, and the centers of E. disturbances, are near the sea, or other large supplies of water; and he says that when an irruption of igneous matter takes place beneath the sea-bottom, the first action must be to open up large fissures in its rocky material, or to lift and remove its incoherent portions, such as sand, mud, gravel, etc. The water on meeting the heated surfaces assumes the spheroidal state; while in this condition, the intestine motion may be great, but little steam is generated; but no sooner have the surfaces cooled, than the water comes into close contact with them, and a vast volume of steam is evolved explosively, and blown off into the deep and cold water of the sea, where it is condensed, and thus a blow of the most tremendous sort is given at the volcanic focus, and being transferred outwardly in all directions, is transmitted as the E. shock. The surfaces of the ignited material, however, now cooled down below the point at which steam can be generated rapidly, merely keep up a gentle ebullition, which is transmitted as the trembling after the shock. On the surfaces again becoming heated by conduction from the molten mass, the various phases are again repeated. This he considers the chief cause of earthquakes, but he supposes they may also be due to the evolution of steam through fissures, and its irregular and *per saltum* condensation under pressure of seawater; or to great fractures and dislocations in the rocky crust, suddenly produced by pressure acting on it from beneath, or in any other direction.

The old assumption that the earth consists of a molten fluid core with a cooled and hardened rind floating upon it, is inconsistent with the rigidity that astronomers have proved the earth to possess. But although the earth must be mainly solid, it is yet believed to be of a honey-combed structure, and that the cavities contain in many places lakes of molten rock, between which and the surface volcanoes are orifices of communication. Into these cavities, water sinking down through crevices from the ocean or the land must be constantly finding its way; and the steam thus generated exerts such enormous pressure as to force the molten matter to the surface, itself mingling and escaping along with it. When a mass of water is suddenly precipitated into a hot cavern, the explosion of steam will cause an earthquake concussion, and where there is no vent, may be sufficient to rend the superincumbent strata. The celebrated Lisbon earthquake, of 1755, was severely felt in the middle and eastern U. S., and high waves appeared in the harbors of New York and Boston. In Oct., 1811, an earthquake extended from the mouth of the Ohio river 300 m. southward, continuing its disturbances until March 26, 1812. A shock, Oct. 19, 1870, covered the area including Quebec, St. John, N. B., Chicago, and New York, and the velocity of the wave was estimated at 14,000 ft. per second. Nov. 18, 1878, an area of 150,000 sq. m. in the Mississippi valley was disturbed. The heaviest earthquakes on the Pacific coast in this century were in 1868 and 1872. In August, 1884, the area including Washington, Toledo, O., and Portland, Me., was shaken. The shock of August 31, 1886, covered 20 states, and was felt from Ontario, Canada, to Bartow, Fla., and westward to Detroit. The direction of the vibrations was from s.e. to n.w.; but no tidal wave followed, as was expected. The earthquakes in North America in 1885 were distributed as follows: Canadian provinces, 8; New England, 5; Atlantic states, 9; Mississippi valley, 3; Pacific coast, 34. Record for period 1872-83: Atlantic slope, 147; Mississippi valley, 66; Pacific slope, 151. In the entire area they occur on an average once in 12 days, and on the Atlantic slope once a month.

In 1692 the island of Jamaica was so agitated that planted fields changed places. The coast of Venezuela was shaken from Oct. 21, 1766, to Dec., 1767. Caracas was destroyed, March 26, 1812, the shocks continuing 10 days. In 1868 large cities in Ecuador were swallowed up; Arica and Arequipa, Peru, were destroyed; and the sea retreated from the harbor of Arica, sending, on its returning wave, a U. S. steamer two m. inland.

EARTHS, in chemistry, are a class of substances regarded by the alchemists and older chemists as elementary, and which are insoluble in water. The earths *proper* are now known to be compound, consisting of a metal in combination with oxygen. The list includes alumina, glucina, zirconia, thoria, didymia, lanthana, ceria, yttria, terbia, erbia. They do not alter vegetable colors, are soluble in acids, and are precipitated from their solutions by ammonia, potash, or soda. The *Alkaline Earths* have already been noticed. See **ALKALIES**.

EARTH-SHINE, the reflection from the moon of the light cast upon her by the earth, particularly noticeable in clear nights at the time of new moon, when sometimes the whole surface of the moon can be seen in ashy colored light. The earth serves the same purpose to the moon that the moon does to the earth; that is, the earth is the moon's moon, and would present to an observer on the moon the same phases that the moon does to us; but the earth would, to an observer from the moon, appear four times as large as the moon does to us. When it is new moon to us, it is full moon to an observer on the side of the moon facing the earth, and, as the earth is much the larger, it gives to the moon about 16 times as much light as the full moon gives to us. This light, reflected back to us, is known as earth-shine. It is really the light of the sun reflected by the earth to the moon, and by the moon back to the earth.

EARTHWORKS. The largely increased use of hasty earthworks on the field of battle is the result of the range and rapidity of fire of the modern rifle, and of the range and shell power of rifled artillery. It is the absolute necessity of shelter from the intensity of fire, while at the same time giving full scope to its effects, which has brought the entrenching tool into such notice, and made it almost one of the weapons of the foot soldier of our time. One of the most striking features of the modern fortified position is the long lines of shelter trenches and improvised cover, all raced to direct fire to their front; the cleared foreground, and further, the large amount of splinter-proof cover required for full protection from rifle and shrapnel bullets. In all other kinds of land defenses the broken traces, adapted to the fire combat, when rifles had less range than now, have given way in favor of simple forms providing much frontal fire. The profiles, too, have undergone a corresponding modification. The interior trench has become a necessity for cover as well as for rapidity of execution, and it has often to be blinded, as for instance in the Plevna works. The ditch in front, which used always to be made deep, with as steep sides as possible, is now very generally made shallow, so as to be swept as far as may be by fire from the parapet. The exterior slope of the parapet is made much more gentle, to diminish the effect of high velocity shells. The self-flanking bastioned trace has disappeared from the scene, alike in field and permanent works, trust being placed in the withering effects at close quarters of the magazine gun. It is proposed overcoming the dislike on the part of the infantry soldier to work on entrenchments when in the field by peace training. No sadder instance of unreadiness in this particular is to be found in modern wars than the attack of the Green Hills by the Rus-

sian general Skobelev. To get cover from the fearful fire of the Turks, the Russian soldiers tried to scrape up earth with the covers of mess-tins, bayonets, and their fingers, and even resorted to piling up the bodies of the dead. After this experience they were glad to carry a shovel weighing 5 lbs. See further under FORTIFICATION.

EARTHWORM, *Lumbricus*, a genus of *annelida* (q.v.), of the order *terricole*. There are many species, all of them pretty closely resembling in characters and habits the common E. or dew-worm (*L. terrestris*), which is everywhere plentiful in Britain and throughout Europe, and is familiar to everybody. It has no head distinct from the body, no eyes, no antennæ, nor any organs external to the rings of which its body is composed, except minute bristles pointing backwards, of which each ring bears four pair, and which are of use in its locomotion. It sometimes attains to nearly a foot in length, and more than 120 rings have been counted in its body. The end at which the mouth is situated is pointed, and the tail is flattened, whilst the general form is cylindrical. The mouth consists merely of two lips, the upper lip elongated; there are no teeth nor tentacles, and the worm subsists by swallowing fine particles of the soil, from which its digestive organs extract the digestible matter, the rest being voided often in little intestine shaped heaps, called *worm-casts*, on the surface of the ground. The locomotion of the E. is effected by means of two sets of muscles, which enable it to contract and dilate its rings; its bristles preventing motion backwards, and the whole muscular effort thus resulting in progress; whilst the expansion of the rings, as it contracts the anterior segments, and draws forward the hinder parts, widens a passage for it through earth whose particles were close together before. Earthworms are thus of very great use, their multitudes continually stirring and loosening the soil through which they work their way; and moles, pursuing them to feed on them, stir and loosen it still more; whilst worm-casts gradually accumulate on the surface to form a layer of the very finest soil, to which it is supposed that the best old pastures in a great measure owe their high value.

Earthworms do not often visit the surface of the ground, except during night, and when the ground is moist. In the evening, during or after rain, or in the morning, when the dew is abundant, they may sometimes be seen traveling about in great numbers. Both drought and cold cause them to retreat more deeply into the earth.—Their respiration is effected by means of little sacs, which communicate by minute pores with the external air. They are hermaphrodite, but mutual fecundation takes place by means of the thickened knot (*clitellum*) which is situated before the middle of their body. Their eggs often contain two embryos, and the young worms escape by a sort of valvular opening at the end.

Besides their usefulness in the improvement of the soil, earthworms are of importance as food for birds, fishes, etc. Their value as bait for fishes is well known to every angler. The instinct which prompts them to hasten to the surface, when, in quest of bait, the angler shakes the soil with a spade or fork, is probably to be referred to the similar shaking on the approach of their constant enemy, the mole.

An E. of great size is common in the East Indies, wherever the climate is moist, from the Himalaya to Ceylon and Java. Much interesting light was thrown on earth worms in Mr. Darwin's work, *The Formation of Vegetable Mould through the Action of Worms* (1881).

EAR-TRUMPET, a contrivance for improving the hearing of the partially deaf. For this purpose many ingenious instruments have been devised. The principle in them all is the same: to collect the sonorous vibrations, and to convey them in an intensified form to the deeper parts of the ear. In this way the hand placed behind the external ear constitutes the simplest form of ear-trumpet. Though, in a great number of cases of impaired hearing, there can be no doubt that much assistance and comfort are obtained from the use of one or other of the varieties of the ear-trumpet, still they must not be used indiscriminately, for in unsuitable cases they often do much mischief, both by increasing the deafness, and aggravating the noises in the head from which deaf persons often suffer so much. They are of most use, perhaps, in advanced cases of nervous deafness, though injurious in the early stages of this complaint; they are hurtful also in all acute diseases of the organ, and of little or no use in those cases of great thickening of the contents of the middle ear, where the adapting power of the organ has been lost. There are many varieties of trumpet in common use. It is generally admitted that most of the small and so-called invisible ear-trumpets are practically useless. All of the useful instruments have good-sized bowls, which in some cases rest against the temple when inserted in the ear, thus aiding the hearing by bone conduction. The best expedient for obviating roaring and indistinct sounds is the use of wire meshes, called refiners. Different combinations of various sized meshes are placed over the mouth of the trumpet, the choice of refiners being a matter of experiment for the patient. The apparatus most commonly in use requires to be held in the hand, and consists of a narrow portion inserted into the ear-passage, and which gradually expands into a wide mouth; or the extremity of the instrument may be turned downwards, as in that form which passes by the name of Miss Martineau's trumpet. Another variety, applicable to the more severe cases of deafness, consists of an elastic tube, one end of which is tipped with ivory and is placed in the ear of the patient; the other is held in the hand of the speaker, who applies his mouth to the open extremity. Ear-trumpets are generally made of some thin metallic substance, such as tin. Gutta-percha, and other substances are also frequently used. See AUDIPHONE.

EARWIG, *Forficula*, a genus of orthopterous insects, recently subdivided into a number of genera, and forming the family *forficulidæ*, which many entomologists constitute into a distinct order, *dermaptera* (Gr. leather-winged). These insects indeed connect the true *orthoptera* with the *coleoptera*. Their legs are formed for running, and not for leaping; their wing-covers (*elytra*)—which are very small, and hide only a small part of the abdomen—are of firmer substance than in the other *orthoptera*; the wings, of which there are two sets—hind and fore wings—are curiously folded under them, both longitudinally, in a fan-like manner, and transversely; the organs of the mouth resemble those of the true *orthoptera*, with which also earwigs agree in the important character of *semi-complete* metamorphosis; the larvæ and pupæ much resembling the perfect insect, running about and feeding in the same manner, but the larvæ being destitute of wings and wing-covers, the pupæ having them only in a rudimentary state. Earwigs have the body narrow, and of nearly equal breadth throughout, the head exposed, the mandibles very strong and horny, the antennæ long and thread-shaped. The abdomen bears at its extremity a large pair of forceps, apparently of use as an instrument of defence. Earwigs abound in moist situations, as under the decayed bark of trees, under stones, among decaying straw, etc. They feed both on animal and vegetable food; the COMMON E. (*F. auricularia*), very abundant in America and in most parts of Europe, is troublesome to gardeners by eating the leaves of plants and the petals of fine flowers; but the injury which it does is probably more than compensated, particularly as to field-crops, by the destruction of multitudes of smaller insects, as *thrips*, *aphis*, etc. The appearance of this insect is by no means agreeable, and its mandibles and forceps are suggestive of unpleasant possibilities, which, however, would seem never to be realized, although it is a very frequent visitor of houses, particularly those of which the walls are covered with foliage. It is curious how extensively prevalent the notion is that earwigs creep into the ear. To this they owe their English name (E. from *ear*, and Sax. *wiega*, a worm or grub), and their names in many languages, as the French *perceoreille*, the German *Ohrwurm*, etc. Newman, in his *Introduction to the History of Insects*, says: "The shape of these wings (the hind ones), when fully opened, is nearly that of the human ear; and from this circumstance it seems highly probable that the original name of this insect was *earwing*." See *illus.*, BEETLES, ETC., vol. II.

EAS'DALE, a small isle on the w. coast of Argyleshire, in the firth of Lorn, 10 m. s.s.w. of Oban. It contains $1\frac{1}{2}$ sq. m., and is situated in Kilbrandon parish. It is noted for its primary or metamorphic slate-quarries, belonging to the marquis of Breadalbane, which have been wrought for more than 150 years. Compact feldspar and conglomerate also occur in the isle.

EASEL. This structure, the object of which is to support the canvas or panel of the artist at a convenient height for work, has been used for ages pretty much in its present form.

EASEMENT is a legal term signifying some right of the public, or of an individual, in lands owned by another; a right existing either at common law or by statute; such, for example, as the right of way across another's estate, or to receive water from, or discharge it across, such estate. The E. is either affirmative or negative; affirmative when the owner of an estate is entitled to do something on the estate of another; negative when he is forbidden to do something, otherwise lawful, on his own premises. It may arise from the nature of things, or from special contract, express or implied. It is an E. when the owner of land makes a grant thereof for public use, as for a road or park, whereby the public gains only a right of use for the purpose specified, the title still remaining with the grantor. An E. in the land of another may also be acquired by prescription—that is, by the continuous and open enjoyment of a privilege without objection for a certain term of years. Easements may be extinguished by release or abandonment, or by a union of the two estates in the same person.

EAST (Ger. *Ost*; allied probably to Greek *ēōs*, the morning, and Lat. *oriens*, the rising, i.e., sun) is, vaguely speaking, that quarter of the horizon where the sun rises, or which a person with his face to the s. has on his left hand. It is only at the equinoxes that the sun rises exactly in the e. point. A line at right angles to the meridian of a place points exactly e. and west. See **MERIDIAN** and **HORIZON**.

From very early times, the e. has been invested with a certain sacred character, or at least held in respect over other points of the compass. It was the practice of the ancient pagans to fix their altar in the eastern part of their temples, so that they might sacrifice towards the rising sun, which in itself was an object of worship. The custom of venerating the e. was perpetuated by the early Christian church from various circumstances mentioned in the sacred record. For example: "The glory of the God of Israel came from the way of the east."—Ezek. xliii. 2. "There came wise men from the east to Jerusalem."—Matt. ii. 1. "And, lo, the star, which they saw in the east, went before them."—Matt. ii. 9. Tradition heightened respect for the east. It was said that Christ had been placed in the tomb with his feet towards the e., and that at

the day of judgment he should come from the eastward in the heavens. Looking towards the sun in the e. in praying or repeating the creed, was thought to put worshippers in remembrance that Christ is the son of righteousness, and such an attitude was accordingly adopted as an aid to devotion. From these various circumstances, the building of churches with the chancel (q.v.) to the e., bowing to the e. on uttering the name of Jesus, and burying with the feet to the e., were introduced as customs in the church. In recent times there has been a general disregard to the practice of turning formally with the face to the e. on repeating the creed, and, as is well known, the attempt to revive it by a party in the English church has caused considerable dispeace. It is a curious instance of the inveteracy of popular custom, that in Scotland, where everything that savored of ancient usage was set aside as popish by the reformers, the practice of burying with the feet to the e. was maintained in the old churchyards, nor is it uncommon still to set down churches with a scrupulous regard to e. and west. In modern cemeteries in England and Scotland, no attention appears to be paid to the old punctilio of interring with the feet to the e., the nature of the ground alone being considered in the disposition of graves.

EAST BATON ROUGE, a parish in s.e. Louisiana, between the Mississippi and Amite rivers, 450 sq. m.; pop. '70, 17,816—11,343 colored; in '90, 25,922. Surface, generally level, with fertile soil, producing corn, cotton, sugar, molasses, etc. Seat of justice, Baton Rouge.

EASTBOURNE, a rising wateringplace in the s.e. of Sussex, Eng. It lies in a chasm between two cliffs, one of which, 3 m. to the s.e., forms Beachy Head. In the vicinity are fine drives and walks. It has a martello tower and a fort. Pop. of parish, '91, 34,977. E. is supposed to have been of Roman origin, and remains of a Roman villa, bath, and tessellated pavements have been found here.

EAST BRIDGEWATER, a town in Plymouth co., Mass., 25 m. s.e. of Boston on the New York, New Haven, and Hartford railroad. There is abundant water power, and an iron foundry, and manufactories of cotton gins, linters, and shoe machinery. The town has a high school, public library, savings bank, and excellent artesian well water. Pop. '90, 2911.

EASTBURN, JAMES WALLIS, 1797-1819; b. England; came to America when a child; graduated at Columbia college in 1816, and studied theology with the purpose of taking orders in the Episcopal church. While a student he began a new metrical version of the Psalms. He was joint author with Robert C. Sands of *Yamoyden*, a romance founded upon the life of Philip, the Narragansett king; and he wrote many small poems. In 1818, he was ordained and took charge of a church in Virginia, but died while on a voyage to the West Indies for his health.

EASTBURN, MANTON, D.D., 1801-72; b. England; brother of James Wallis; came to the United States when a child; graduated at Columbia college, 1817; studied in the Episcopal theological seminary, and was ordained to the ministry, 1825. He was for several years rector of the church of the Ascension, New York, and in 1843 became bishop of Massachusetts. He published *Lectures on Hebrew, Latin, and English Poetry*; *Essays and Dissertations on Biblical Literature*; *Lectures on the Epistle to the Philippians*; and many sermons and addresses. He gave the most of his property to religious and benevolent institutions.

EAST CAPE, the name of the most easterly headlands of the island of Madagascar, of the North island of New Zealand, and of Siberia or Asiatic Russia. The *first* is in lat. 15° 20' s., and long. 50° 15' e.; the *second* in lat. 37° 40' s., and long. 178° 40' e., being almost precisely the antipodes of Carthage in Spain; and the *third* is that extremity of the old world which is nearest to the new, being separated by Behring's strait (q.v.) from cape Prince of Wales in America. It is in lat. 66° 6' n., and long. 169° 38' w.; or rather, to follow the natural reckoning, 190° 22' east.

EAST CARROLL, a parish (co.) in n.e. Louisiana; formed 1877 from part of Carroll; bounded e. by Mississippi; intersected by Tensas river and Bayou Macon; surface well timbered; soil fertile. Area, 400 sq. m.; pop. '90, 12,362. Co. seat, Lake Providence.

EASTER (Ger. *ostern*, Fr. *pâque*, Scot. *pasch*, from Gr. *pascha*, the passover), the festival of the resurrection of Jesus Christ, derives probably its Teutonic name from the festival of the goddess Ostara, in Ang.-Sax. Eastre, which the Saxons of old were wont to celebrate about the same season at which the Christian festival of E. occurs. In the ancient church, the celebration of E. lasted 8 days. After the 11th c., however, it was limited to 3, and in later times, generally to 2 days. It was formerly the favorite time for performing the rite of baptism. The courts of justice were closed, and alms dispensed to the poor and needy, who were even feasted in the churches—a custom which led to much disorder. Slaves also received their freedom at that season; and as the austerities of Lent were over, the people gave themselves up to enjoyment; hence the day was called the "Sunday of joy" (*Domìnica gaudiì*). To the popular sports and dances were added farcical exhibitions, in which even the clergy joined in some places, reciting from the pulpit stories and legends, with a view to stir the hearers to laughter (*risus paschalis*). Against this indecency, the reformers of the 16th c. loudly and successfully raised their voices. During the whole week before E.—that is, in the inter-

val between Palm Sunday and the beginning of the E. festival—daily services were held. See PASSION WEEK and GOOD FRIDAY.

On E. day, the people saluted each other with the E. kiss, and the exclamation *Surrexit* (He is risen); to which the reply was *Vere surrexit* (He is risen indeed). The chief solemnity always consisted of the celebration of the Lord's supper.

The proper time for the celebration of E. has occasioned no little controversy. In the 2d c., a dispute arose on this point between the eastern and western churches. The great mass of the eastern Christians celebrated E. on the 14th day of the first Jewish month or moon, considering it to be equivalent to the Jewish Passover. The western churches celebrated it on the Sunday after the 14th day, holding that it was the commemoration of the resurrection of Jesus. The council of Nice (325 A.D.) decided in favor of the western usage, branding the eastern usage with the name of the "quartadeciman" heresy. This, however, only settled the point that E. was to be held, not upon a certain day of the month or moon, but on a Sunday. The proper astronomical cycle for calculating the occurrence of the E. moon was not determined by this council. It appears, however, that the metonic cycle (q.v.) was already in use in the west for this purpose; and it was on this cycle that the Gregorian calendar, introduced in 1582, was arranged. The method on which this calendar is constructed is too complex for description here. An elaborate account of the whole matter was published by prof. De Morgan in the *Companion to the British Almanac* in 1845, and to this the reader is referred. The time of E. being the most ancient and important of all the movable feasts of the Christian church, determines all the rest. It was debated, at the time of the introduction of the Gregorian calendar, whether E. should continue to be movable, or whether a fixed Sunday, after the 21st of Mar., should not be adopted. It was deference to ancient custom that led the ecclesiastical authorities to adhere to the method of determination by the moon. It must be remembered, however, that it is not the actual moon in the heavens, nor even the mean moon of astronomers, that regulates the time of E., but an altogether imaginary moon, whose periods are so contrived that the new (calendar) moon always follows the real new moon (sometimes by 2, or even 3 days). The effect of this is, that the 14th of the calendar moon—which had, from the times of Moses, been considered "full moon" for ecclesiastical purposes—falls generally on the 15th or 16th of the real moon, and thus after the real full moon, which is generally on the 14th or 15th day. With this explanation, then, of what is meant by "full moon," viz., that it is the 14th day of the calendar moon, the rule is that E. day is always the first Sunday after the paschal full moon, i.e., the full moon which happens upon or next after the 21st of Mar. (the beginning of the ecclesiastical year); and if the full moon happens upon a Sunday, E. day is the Sunday after. For any given year, the day on which the paschal full moon falls, and then E. day, are found by the following table and rule:

| Days of the Month. | Dominical Letter. | Golden Number. | Days of the Month. | Dominical Letter. | Golden Number. |
|--------------------|-------------------|----------------|--------------------|-------------------|----------------|
| March 21..... | C | 14 | April 8..... | G | |
| " 22..... | D | 8 | " 9..... | A | 15 |
| " 23..... | E | .. | " 10..... | B | 4 |
| " 24..... | F | 11 | " 11..... | C | .. |
| " 25..... | G | .. | " 12..... | D | 12 |
| " 26..... | A | 19 | " 13..... | E | 1 |
| " 27..... | B | 8 | " 14..... | F | .. |
| " 28..... | C | .. | " 15..... | G | 9 |
| " 29..... | D | 16 | " 16..... | A | .. |
| " 30..... | E | 5 | " 17..... | B | 17 |
| " 31..... | F | .. | " 18..... | C | 6 |
| April 1..... | G | 13 | " 19..... | D | .. |
| " 2..... | A | 2 | " 20..... | E | .. |
| " 3..... | B | .. | " 21..... | F | .. |
| " 4..... | C | 10 | " 22..... | G | .. |
| " 5..... | D | .. | " 23..... | A | .. |
| " 6..... | E | 18 | " 24..... | B | .. |
| " 7..... | F | 7 | " 25..... | C | .. |

First ascertain the dominical letter (q.v.)—taking the second where there are two—and the golden number (see EPACT); look for the golden number in the third column of the table, and opposite to it stands the day of the full moon; then look for the dominical letter, next after the day of full moon, and the day standing opposite the dominical letter is E. day. It sometimes happens that E. day, as thus determined, is different from what it would be if by "full moon" were understood the astronomical full moon. Thus, in 1818, E. day, by the calendar, fell, and was celebrated on the 22d of Mar., the earliest possible day, although the full moon was on that day; and in 1845, it again fell on the day of the actual full moon (the 23d of Mar.).

One object in arranging the calendar moon was, that E. might never fall on the same day as the Jewish Passover. They did occur together, however, in 1805, on the 14th of April; and in 1825, on the 3d April; and will do so again in 1903, on the 12th April;

in 1923, on the 1st April; in 1927, on the 17th April; and in 1981, on the 19th April. The Jewish festival usually occurs in Passion week, and never before the 26th of Mar., or after the 25th of April (new style). On the other hand, the Christian festival is never before the 22d of Mar., or after the 25th of April. In 1761 and 1818, E. fell on the 22d of Mar.; but neither in this nor the following century will such be the case again. In 1913, it will fall on the 23d of Mar., as it did in 1845 and 1856. The latest Easters in this century and the following, occur in 1886 and 1943, on the 25th of April. In 1848, E. fell on the 23d of Apr., and in 1859, on the 24th of April.

Popular Observances.—Many of the popular observances connected with E. are clearly of pagan origin. The goddess Ostara or Eastre seems to have been the personification of the morning or east (q.v.), and also of the opening year or spring. The Anglo-Saxon name of April was Estormonth; and it is still known in Germany as Ostermonath. The worship of this being seems to have struck deep root in northern Germany, and was brought into England by the Saxons. It continued to be celebrated in many parts in the n. of Germany down to the beginning of the present century, by the kindling of bonfires and numerous other rites. See BELTEIN. Like the May observances of England, it was especially a festival of joy. With her usual policy, the church endeavored to give a Christian significance to such of the rites as could not be rooted out; and in this case, the conversion was particularly easy. Joy at the rising of the natural sun, and at the awaking of nature from the death of winter, became joy at the rising of the Sun of Righteousness—at the resurrection of Christ from the grave. The bonfires can be traced in the great “paschal tapers,” sometimes weighing 300 lbs., with which the churches were lighted on E. eve. In the ancient church disbursements of St. Mary-at-Hill, in the city of London, there is even an entry “For a quarter of coles for the hallowed fire on Easter eve, 6d.”

The most characteristic E. rite, and the one most widely diffused, is the use of *Pasch* (i.e., Easter) eggs. They are usually stained of various colors with dye-woods or herbs, and people mutually make presents of them; sometimes they are kept as amulets, sometimes eaten; games are also played by striking them against one another. In some moorland parts of Scotland, it used to be the custom for young people to go out early on “Pasch Sunday” and search for wild-fowls’ eggs for breakfast, and it was thought lucky to find them. There can be little doubt that the use of eggs at this season was originally symbolical of the revivification of nature—the springing forth of life in spring. The practice is not confined to Christians; the Jews used eggs in the feast of the Passover; and we are told that the Persians, when they keep the festival of the solar new year (in Mar.), mutually present each other with colored eggs.

From the Christian point of view, this “feast of eggs” has been usually considered as emblematic of the resurrection and of a future life.

EASTER, DATE OF. The following are the dates for the occurrence of E. in each year from 1880 to the end of this century :

| | | | | |
|-----------------|-----------------|-----------------|-----------------|-----------------|
| 1880, March 28. | 1885, April 5. | 1889, April 21. | 1893, April 2. | 1897, April 18. |
| 1881, April 17. | 1886, April 25. | 1890, April 6. | 1894, March 25. | 1898, April 10. |
| 1882, April 9. | 1887, April 10. | 1891, March 29. | 1895, April 14. | 1899, April 2. |
| 1883, March 25. | 1888, April 1. | 1892, April 17. | 1896, April 5. | 1900, April 15. |
| 1884, April 13. | | | | |

Other principal days of observance may be found by reckoning from Easter. The first day of Lent (Ash Wednesday) is Wednesday in the 7th week before Easter. The Crucifixion day (Good Friday) is the Friday before Easter. The Ascension day is Thursday, the 40th day after Easter. The Pentecost day (Whitsunday) is the 50th day after E., or the Lord’s day 7th after Easter.

EASTER ISLAND, originally DAVIS’S LAND, is a detached spot on the Pacific, in lat. 27° 20’ s., and long. 109° 30’ west. It is of volcanic origin, rising 1200 ft. above the sea; and it is moderately fertile, but almost destitute of water. It belongs to the Polynesian archipelago, of which it forms the south-easterly extremity. On this island, of 30 miles’ circumference, and inhabited by a population of less than 2,000, there exist multitudes of rude stone statues, some of them of colossal size, and standing on long platforms of Cyclopean masonry. The present inhabitants, whose language is radically the same as that of Tahiti, have no tradition of the race that made them. The existence of these sculptures is thought to strengthen the conclusion, arrived at on other grounds, that the Polynesian islands are relics of a submerged continent.

EASTERN ARCHIPELAGO. See MALAY ARCHIPELAGO.

EASTERN CHURCHES include : I. The Greek church, which contains in Russia about 55,000,000; in Turkey, 11,500,000; in Austria, 3,000,000; in Greece, 1,225,000; and in the United States (chiefly in Alaska), 50,000; in all, more than 70,000,000. II. Armenians, 3,000,000. III. Copts and Abyssinians, 3,000,000. IV. Jacobites (in Turkey and India), 220,000. V. Nestorians, including the Christians of St. Thomas, in India, 165,000. The total in them all is about 76,500,000.

EASTERN EMPIRE. See BYZANTINE EMPIRE.

EASTERN QUESTION, in popular usage, is the problem of the future disposition of the Turkish empire and its territory, as related to the supposed designs of Russia, and to the interests of other European nations, England and Austria in particular. Voltaire, in the time of Catherine II., characterized Turkey as "the sick man," and for a hundred years it has been an assumption of European diplomacy that the empire was on the road to disintegration and death. In these circumstances, Russia, from her geographical position and in accordance with her traditional policy, waits for an opportunity to seize and absorb the territory of "the sick man." Other European nations, each for reasons of its own, dread such an extension of Russian domination. Austria, if Turkey should be despoiled, would naturally claim for herself a slice of the territory; and England fears that if Constantinople should fall into the possession of Russia, the highway to her eastern possessions would be closed, and Russia become dominant in that quarter. The question, moreover, assumes a religious aspect, Turkey being a Mohammedan power, and Russia finding an excuse for aggressive designs in the assumed necessity of affording protection to the Christian populations in the Turkish empire. England, on the other hand, though at the head of the Christian powers, yet being anxious to preserve the autonomy of Turkey as a subservient empire, is placed in a position of seeming indifference to the wrongs which Russia is so zealous to redress. The Crimean war of 1854-56 had its origin in the desire to check the advance of Russia, and the treaty of Paris put that power under sharp restrictions. Russia, by the recent invasion of Turkey, roused again the hostility of the European powers, which found expression in the treaty of Berlin, greatly limiting the fruits of the Russian conquest, and putting that empire under annoying restraints. Turkey was made to promise certain reforms, which, if carried into effect, would deprive Russia of excuse for further aggressions; but the promise has not been and is not likely to be fulfilled: it is doubtful indeed whether the fulfillment is within the power of Turkey. The eastern question, therefore, has not yet reached a permanent solution. Good illustrations of the obstacles in the way are afforded by the history of the Armenian massacres of 1895-6, the Cretan difficulty, and the Græco-Turkish war of 1897. See **BERLIN, TREATY OF**, and **TURKEY**.

EASTERN, or ORIENTAL, RITE, the name given to the rituals of the Armenian, Coptic, Greek, and Syrian Roman Catholics, who, acknowledging the supremacy of the pope of Rome, have been allowed to retain their own modes of performing divine worship. These differ from the Latin, not only by being in the language common among the people, but also in continuing "communion in both kinds" to the laity, and marriage to the lower clergy. Among these branches of Roman Catholics there are about 80 bishops, of whom 5 are patriarchs and 26 archbishops.

EASTERN SHORE, the counties of Accomack and Northampton in Virginia, and all of Maryland lying e. of Chesapeake bay (sometimes including Delaware also). It is a fertile region, famous for its product of peaches and garden vegetables, and equally famous for oysters. The country, though low and level, is generally healthful, and the climate is mild and equable. It is intersected by railroads, and there is abundance of steam-boat navigation. Until invaded by railroads and overrun by small owners, this was the "blue blood" section of Virginia, noted for aristocracy and hospitality.

EASTERN STATES, commonly so called, comprise the northeastern part of the United States, and go under the name of New England. There are six states in the group, namely: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut. They comprise an area of over 66,000 square miles and had in 1890 a population of 4,700,745. This region was granted to the Plymouth company by the English king, James I., in 1606, and in 1614 received the name of New England from Captain John Smith. The early settlers were Puritans, and the inhabitants are chiefly their descendants, but consist also of later English immigrants, with a mingling of Scotch. The eastern states have never suffered from the evils of pauper immigration as have the central and western parts of the country. The people have always borne the name of Yankees, and are particularly noted for their thrift and industry; while these states have been largely engaged in manufacture, they have also been a centre of learning for the whole country. The territory of the eastern states lies between 41° and 47° 32', north latitude; and 66° 52' and 73° 50' west longitude. All the states except Vermont have a coast line. The northern half of the coast is sharp and rocky; the southern half, low and sandy. The soil is in general very fertile, but of late years has been somewhat abandoned for the more inviting territory of the west. New Hampshire and Vermont have especially suffered from this tendency. The eastern states have always played an important part in the political history of the United States. Although they have furnished fewer presidents than some other parts of the country, they have had many men in congress who have won national reputations for political ability and sagacity.

EASTER OFFERINGS, or EASTER DUES, small sums paid to the parochial clergy in England by their parishioners at Easter, as a compensation for personal tithes, or the title for personal labor.

EASTER TERM, LEGAL. For a general history of the law terms in England, see **LAW TERMS**. E. T. was formerly dependent upon the movable feast of Easter, and was hence called a movable term. It commenced on the Wednesday fortnight after Easter Sunday, and lasted till the following Monday three weeks. But by 11 Geo. IV.

and 1 Will. IV. c. 70, amended by 1 Will. IV. c. 3, E. T. now begins on 15th April and ends on 8th May. If any of the days between the Thursday before and the Wednesday after Easter fall within term, no sittings in banc (q.v.) are held on those days, and the term is prolonged a corresponding number of days.

EAST FELICIANA, a parish in s.e. Louisiana, on the Mississippi and Amite rivers, reached by the Yazoo and Mississippi Valley railroad; 485 sq. m.; pop. '90, 17,903, includ. colored. It is generally level, well watered, and fertile; producing corn, cotton, rice, etc. Seat of justice, Clinton.

EAST HADDAM, a town in Middlesex co., Conn.; on the e. bank of the Connecticut river, about 16 m. from its mouth, and 30 m. below Hartford. It has manufactories of cotton, twine, lime, spoons, and German silverware. The surface is hilly; and among the hills in the n.e. part, near the river, remarkable subterraneous noises, as of rumbling and jarring, have occasionally been heard, though of late years more rarely than formerly. The sound is called "Moodus noise," from the name given to the region by the Indians, who ascribed to the sound a supernatural origin. Incorporated in 1734. Pop. '90, 2599.

EAST HAMPTON, a town in Hampshire co., Mass., on the New York, New Haven, and Hartford, and the Boston and Maine railroads, in the beautiful valley of the Connecticut, 4 m. s.w. of Northampton. Its manufactures include elastic goods, buttons, underwear, cloths and yarns. It has a public library, many schools, electric lights, public park, spring water, national and savings banks, and Williston seminary for young men, founded by Samuel Williston, and endowed with more than \$800,000. Pop. '90, 4395.

EAST HAMPTON, a town in Suffolk co., N. Y., comprising the e. end of Long Island, including the peninsula of Montauk; reached by the Long Island railroad; pop. '90, 3000. Much of the land is a narrow, sandy tract, between the ocean and the sound, of little value. The w. portion is fertile, producing fruits, vegetables, etc. The extreme e. part, known as Montauk Point, is a breezy, grassy upland, and has a noted light-house. The village of East Hampton is 7 m. s.e. of Sag Harbor. It is an agreeable and popular summer resort. The town was settled in 1649.

EAST HUMBOLDT MOUNTAINS, in Elko co., Nevada; a range with peaks 15,000 ft. high; for the most part well wooded. Fremont's pass is in this range.

EAST INDIA ARMY. When the East India company (q.v.) first sent factors or agents to India, an army was not thought of. Military forces arose out of the exigencies of the times. Some of the first troops in the company's pay were mere adventurers; some were liberated convicts; some deserters from European armies. Gradually organization was introduced, and improved arms furnished. As the power of the company increased, natives entered the battalions; until at length most of the troops were Hindus or Mohammedans, drilled by non-commissioned officers sent out from England. A few regiments were raised in England; a much larger number were raised in India; but all alike were officered by the company's favored English officers, largely paid, and having many opportunities for making rapid fortunes. The ranks were filled by enlistment; the company never compelled the natives to become soldiers; the pay offered was always such as to induce a sufficient number of men to enter. Their periods of leave of absence were liberal; and after a certain number of years' service, they retired on a pension sufficient to support them for the remainder of their days.

At the period immediately preceding the outbreak of the revolt in 1857, the army in the pay of the company comprised about 24,000 royal troops (lent to, and paid for by, the company); 18,000 European troops, raised and drilled by the company in England; 180,000 native regulars; and 60,000 native irregular horse—making about 280,000 in all. This large force was irrespective of 40,000 contingents furnished by dependent native princes, and of the native armies belonging to the independent and semi-independent princes. The company's troops formed three distinct armies, each under its own commander-in-chief, and each stationed in one particular presidency. In these three armies, three kinds of troops—Europeans, native regulars, and native irregulars—had their own special organization. In order to secure unity of action when necessary, it was customary to give the commander-in-chief of the Bengal army precedence over those of Madras and Bombay; he was, in effect, commander-in-chief of the whole of the company's forces. There were too few English officers with the native regiments, and these, in most cases, knew too little of the men under their command. This was not the cause of the revolt in 1857, but it was one of the circumstances that led to the rapid spread of the revolt when once begun. To what extent this fine army melted away during 1857 and the two following years, is described under INDIA.

In 1861, an act was passed reorganizing the Indian army. The *British* portion of it now forms part of the queen's army generally, with certain honorary distinctions, and takes its turn at home and in the colonies like the rest; but the expenses are paid out of Indian, not imperial revenues. The *native* portion is managed wholly in India; but during the eastern crisis, connected with the war between Russia and Turkey, a considerable force of native Indian troops was sent to Malta; and they were also employed in the Egyptian wars, 1882–85. On the reorganization of the Indian army in 1861

the 21st hussars, with the 105th, 106th, 107th, 108th, and 109th foot, were formed from the European troops previously in the service of the East India company.

EAST INDIA COMPANY. On the 31st Dec., 1600, a charter was granted by Queen Elizabeth to a number of London merchants, under the title of "The Governor and Company of Merchants of London trading to the East Indies." From the time when Vasco da Gama effected the eastern passage to India, by doubling the cape of Good Hope, in 1497, the Portuguese carried on an extensive trade with that country, unaffected by rivals until nearly a century afterwards, when the Dutch and the English began to compete with them. This competition became formidable when two "East India companies" were established, one at Amsterdam and one in London. It is of the latter of these that we here treat. The charter was exclusive, as is usual in such cases; prohibiting the rest of the community from trading within the limits assigned to the company. Those limits were enormous, comprising the whole space, land and sea, from the cape of Good Hope eastward to cape Horn—i.e., the whole of the Indian and Pacific oceans. The charter was for fifteen years. The company speedily sent out ships to Java and Sumatra, which returned with calicoes, silk, indigo, and spices. It was then determined to make some kind of settlements on the coast of Hindustan itself: and about 1612, the company obtained permission from the native princes to establish factories or agencies at Surat, Ahmedabad, Cambay, and Gogo.

The company's charter was renewed from time to time, with various modifications, but not without much contention and difficulty. Gradually establishments were formed in Java, Sumatra, Borneo, Celebes, Malacca, Siam, the Banda islands, and other places in the east; as well as on the Coromandel and Malabar coasts of India itself. The first beginning of Madras dates in 1640, of Calcutta in 1645, and of Bombay in 1665, as chief establishments of the company. In 1662, Charles II. gave them permission "to make war and peace on the native princes"—a privilege of which they largely availed themselves for nearly 200 years.

In 1698, the crown granted a charter to a *new* E. I. C., who offered a loan of £2,000,000 to the state; but this naturally led to wranglings, and the two companies were united into one by an act of parliament passed in 1702. The constitution then established was maintained with little alteration as long as the company existed. Every shareholder who held £500 of the company's stock became a member of the court of proprietors, and this court had legislative functions in all that related to the company's affairs. The proprietors annually chose 24 to form a court of directors, from those of their number who held not less than £2,000 of stock. Six of the directors went out of office every year; they retired in rotation, so that each had four years of office. It was a general custom with the proprietors to elect the same persons as directors over and over again. The court of proprietors was to meet once a year, or oftener if necessary; the court of directors as often as the directors chose, provided 13 were present. Theoretically, the constitution of the company was very democratic; but practically the affairs were in the hands of the directors; for the proprietors took little other interest than in receiving their half-yearly dividends. The proprietors had from one to four votes each, according to the amount of stock held by them. The board of control, of later formation, bore relation to the governmental affairs of India.

Properly speaking, the company were only merchants: sending out bullion, lead, quicksilver, woollens, hardware, and other goods to India; and bringing home calicoes, silk, diamonds, tea, porcelain, pepper, drugs, saltpeter, etc., from thence. Not merely with India, but with China and other parts of the east, the trade was monopolized by the company; and hence arose their great trade in China tea, porcelain, and silk. By degrees, avarice and ambition led the company, or their agents in India, to take part in the quarrels among the native princes; this course gave them power and influence at the native courts, from whence arose the acquisition of sovereign powers over vast regions. India thus became valued by the company, not only as commercially profitable, but as affording to the friends and relations of the directors opportunities of making vast fortunes by political or military enterprises. It is not the purpose of the present article to trace the political affairs of the company, or the rise of a British empire in India; that will be done under *INDIA, BRITISH*; it will suffice here merely to state, that no *national* or *patriotic* motive marked the beginning of this course.

In 1744, the company obtained a renewal of their charter till 1780, but not without a loan of £1,000,000 to government; for the monopoly was distasteful to the nation at large. France, too, had an E. I. C., and the struggles between the two companies for power in the southern part of India, led to constant warfare between them during the remainder of the century. Other loans to government were the means of obtaining further renewals of the charter in later years. In 1833, the legislature took away all the *trading* privileges of the company. The dividends to proprietors of East India stock were thenceforward to be paid out of taxes imposed by the company on the people of India, in such provinces as were under British dominion. From that year the company's powers became anomalous; the company could not *trade*, and could not *govern* without the sanction and continued interference of the imperial government. The wars in India, since that year, have been waged by England as a nation, rather than by the company; and England practically, though not nominally, became responsible for the

enormous cost of those wars. In 1853, the charter was again renewed, with a further lessening of the power of the company, and an increase of that of the crown.

Had not the Indian revolt occurred in 1857, the last charter would have remained in force until 1873; but that gigantic calamity led to the resolution—a resolution the wisdom of which was disputed by many of the best judges of Indian affairs—of concentrating the power in the hands of the imperial government. In spite of a strenuous resistance, in 1858, the company were forced to cede their powers, by an act which received the royal assent on the 2d of August. The charter of 1853 had provided that £6,000,000 of India stock should have 10½ per cent dividend *guaranteed* by England out of the revenues of India; and that parliament should redeem this stock at cent per cent premium any time after the year 1873. The act of 1858, therefore, contained due clauses for carrying out these provisions, and transferred the whole of the company's powers to the crown.

The company continued to exist, but for little other purpose than that of receiving and distributing dividends. Most of the distinguished men, military and political, till then in the company's service, accepted office under the crown, to assist the government by their general knowledge of Indian affairs. These affairs are now managed by a secretary in council at the new India office. The valuable library and museum of the company have passed over to the crown; and an act of parliament (1873) provides for the paying off of the India stock and the final extinction of the East India company.

EAST INDIES, as distinguished from *West Indies*, include not merely the two great peninsulas of southern Asia, but likewise all the adjacent islands from the delta of the Indus to the northern extremity of the Philippines. They thus extend, to use round numbers, in lat. from 35° n. to 10° s., and in e. long. from 65° to 130°. At one time, the name of India had, towards the e., a still wider application, occasionally comprising Japan, nay, everything in that direction except China alone. See **INDIA**.

EASTLAKE, Sir CHARLES LOCK, president of the royal academy of London, was b. at Plymouth in 1793, educated at the Charter-House in London, and entered as a student at the royal academy. Subsequently, he went to Paris, where he studied and copied the great paintings then collected in the Louvre. The return of Napoleon from Elba compelled him to leave France. He went back to his native town, and supported himself by portrait-painting. When the *Bellerophon*, with Napoleon on board, appeared in the port of Plymouth, E. profited by the opportunity, and produced his first important picture, "Napoleon at the Gangway of the *Bellerophon*, attended by some of his Officers." In 1817, sir Charles visited Italy and Greece, sketching assiduously in both countries. During a residence of several years in Rome, he executed his "Girl of Albano leading a Blind Woman to Mass," "Isidas the Spartan," "Pilgrims arriving in Sight of Rome," and many others, illustrative of Italian customs and scenery. In 1827, he was elected an associate, and in 1830, a full member of the royal academy. His "Greek Fugitives Prisoners to Banditti," etc., added to his already great reputation; and in 1841, appeared what many conceive to be his masterpiece, "Christ lamenting over Jerusalem." It was immensely admired, the duplicate painted for Mr. Vernon being reckoned one of the most valuable pictures in the Vernon gallery. "Hagar and Ishmael" was exhibited in 1844; "Heloise" in 1845; "The Escape of Francesco Novello di Carrara with Taddea d'Este, his Wife, from the Duke of Milan," in 1850; "Beatrice" in 1855, etc. In 1850, he was elected president of the royal academy, when he received the honor of knighthood. Subsequently, he was appointed director of the national gallery, in which capacity his services were of the highest importance; for besides its improved arrangement, many of the most valuable specimens of the best schools were added to the collection. Sir Charles also acquired a high reputation as a writer on art. In 1847, he published *Materials for the History of Oil Painting*, a work of great learning and research. He contributed several articles to the *Penny Cyclopædia* on subjects belonging to his profession, and executed a translation of Goethe's *Farbenlehre*. In 1853, he received the title of D.C.L. from the university of Oxford. He died Dec., 1865.—**LADY EASTLAKE** (b. Elizabeth Rigby) is an artist of high reputation, and has distinguished herself as an authoress by her *Letters from the Baltic*; *Livonian Tales*; and her articles on subjects connected with art in the *Quarterly Review*.

EASTLAND, a co. in n.w. Texas, on Leon river; 909 sq. m.; pop. '90, 10,373. Cattle raising is the chief industry, but the soil is highly productive. Co. seat, Eastland.

EAST LIVERPOOL, a city in Columbiana co., O., on the Ohio river, and the Cleveland and Pittsburg railroad, 44 miles w. of Pittsburg. Extensive manufactories of pottery, china, and parian ware, and foundries and glass works are among the leading industries. The city has a public library, electric lights and street railroads, improved waterworks, national and savings banks, business college, and a bridge across the Ohio river. Pop. '90, 10,956.

EAST MAIN, formerly a portion of the Hudson bay territories, now incorporated in the dominion of Canada, is bounded n. by Hudson's strait, and w. by Hudson's bay down to its southern extremity, meeting Labrador on the e. and Canada on the south. This immense region, thrice as large as Great Britain, is generally bleak and sterile, yielding little to commerce but fish-oil and a few furs.—A river of the same name, otherwise called the *Slade*, crosses its southern section, entering Hudson's bay, here known as James's bay, about lat. 52° 15' n., after a course of 400 miles.

EASTMAN, HARVEY GRIDLEY, 1832-78; b. Marshall, N. Y. He was the founder of the Eastman national business college, at Poughkeepsie, N. Y., which, starting with one pupil in 1859, became highly prosperous. He served in the N. Y. assembly, 1871 and 1873, and was thrice mayor of Poughkeepsie.

EASTMAN, MARY HENDERSON, b. Va., 1818; daughter of Dr. Thomas Henderson, and wife of Capt. Seth Eastman, of the U. S. army. He was stationed for several years in the Indian country, where his wife wrote *Dakotah, or Life and Legends of the Sioux*; *Romance of Indian Life*; and other works of the kind. In 1852 she published *Aunt Phillis's Cabin*, in response to Mrs. Stowe's famous *Uncle Tom's Cabin*. She has also published the *American Aboriginal Portfolio* and *Chicora and other Regions of the Conquerors and the Conquered*.

EASTON, city and co. seat of Northampton co., Pa.; on the Delaware and Lehigh rivers, the Morris and Essex and Lehigh canals, and the Lehigh Valley, Central of New Jersey, the Delaware, Lackawanna, and Western, the Bangor and Portland, and the Lehigh and Hudson railroads; 57 miles n. of Philadelphia. It has unlimited water-power and manufactories, including railroad switch and signal works, drill works, car seat and railroad supply factories, hosiery mill, chemical works, tannery, and the shops of the Lehigh Valley railroad. The city is supplied with water from the Delaware river and there are electric lights and street railroads, several national banks, public library, hospital, old ladies and children's homes, and daily and weekly newspapers. It is the seat of Lafayette college (q. v.). Pop. '90, 14,481.

EASTON, JAMES, b. Conn. He was a col. in the revolutionary army, raising a regiment by his own exertions, and spent his entire fortune for the service. He was one of the leaders in the capture of Ticonderoga, and brought the news of the victory to the provincial congress. He was also with Montgomery in the invasion of Canada. In Jan. 1776, he received the thanks of congress, but was forced, through the enmity or jealousy of Benedict Arnold, to quit the service in that year.

EASTON, NICHOLAS, b. Wales, 1593; d. R. I., 1675. He went to Massachusetts, 1634; in 1638 he removed to Rhode Island, and built the first house in Newport. He was governor of the colony in 1650. His son John was governor in 1690-95, and was the author of a *Narrative of the Causes which led to King Philip's War*.

EAST ORANGE, a town in Essex co., N. J., on the Delaware, Lackawanna and Western railroad, and an electric railroad connecting with Orange and Newark; 2 miles n.w. of Newark. It is growing rapidly; and has an intelligent and thriving population, being the residence of a large number of people doing business in New York. It has churches, high and graded schools, banks, public hall, good water and sewerage, a weekly newspaper, and numerous handsome residences. The principal streets are macadamized; many of them are bordered with fine shade-trees, and lighted by electricity. Pop. '90, 13,282.

EASTPORT, city and port of entry in Washington co., Me., on Moose island in Passamaquoddy bay, which receives the St. Croix river, the international boundary during its whole course between the United States and Dominion of Canada. On the coast, H. may be said to be the frontier city of the union towards the n.e. Its harbor is deep enough for the largest vessels. The tide rises within it to a height of 25 ft.—a height far exceeded in many other parts of the bay of Fundy, of which Passamaquoddy bay is an inlet. It has a high school, public library, national and savings banks, several churches, electric lights, weekly newspaper, and large fishing and sardine canning interests. Pop. '90, 4908.

EAST PORTLAND, a former city of Multnomah co., Ore., on the Willamette river, opposite Portland. In 1893, East Portland and Albina were consolidated with Portland (q. v.).

EAST PROVIDENCE, a town in Providence co., R. I., separated from the city of Providence by the Blackstone river. It is on the New York, New Haven, and Hartford railroad and an electric line to Providence. On the w. side of the town are the Pawtucket river and Narragansett bay. It contains two villages, Watchemoket and Rumford, and several schools, churches, and chemical works. Pop. '90, 8422.

EAST RIVER, the strait between Long Island sound and New York harbor. It is 20 m. long, separating New York city on the w. from its suburbs, Williamsburg and Brooklyn, on the east. Its narrowest part is the Hurlgate or Hellgate, which is about the middle of its course. Here the rocks which once obstructed the passage have been removed by blasting. The name—clearly a misnomer for an arm of the sea—is convenient as contrasted with the North river, or Hudson, and may have arisen from the river-like action of the tides—an action so powerful as to have here and there materially deepened the channel.

EAST SAGINAW, a former city in Saginaw co., Mich.; consolidated with Saginaw (q. v.) in 1890.

EATON, a co. in s. Michigan, on Grand river, intersected by the Chicago and Grand Trunk, and the Michigan Central railroads; 580 sq. m.; pop. '90, 32,094. The surface is undulating, and the soil productive. Wheat, corn, barley, maple sugar, butter, and wool are the chief staples. Co. seat, Charlotte.

EATON, AMOS, 1776-1842; b. N. Y.; graduated at Williams college in 1799, and became a lawyer and surveyor at Catskill, N. Y. He studied natural sciences and lectured on botany, chemistry, geology, and mineralogy, and with Drs. T. Romeyn Beck and Lewis C. Beck he made a geological survey of Albany and Rensselaer counties. In 1820 he was professor of natural history in the medical college at Castleton, Vt. In 1824 he was at the head of the Rensselaer school of science in Troy. He published many works on botany, chemistry, geology, natural history, and agriculture.

EATON, AMOS BEEBE, 1806-77; b. N. Y.; graduated at West Point, 1826, and entered the army as officer of infantry. After service on the northern frontier, he was transferred, in 1838, to the department of subsistence, and served as commissary in Florida, on the Canada border, and in New York. In the Mexican war he was chief commissary under maj.-gen. Taylor, and in 1851-55 he was in the department of the Pacific. During the civil war he was depot purchasing commissary at New York city, for the armies in the field, and after 1864 was commissary-general of subsistence at Washington. He was made brevet maj. gen. for meritorious and distinguished services.

EATON, CHARLES HENRY, b. Worcester, Mass., 1851; son of the Rev. Henry A.; adopted in childhood by E. D. Draper, of Roxbury. He graduated at Tufts coll. 1877; preached at So. Berwick, Me.; was ordained pastor of the Universalist church, 1877; was called, 1881, to the church of the Divine Paternity, New York.

EATON, DANIEL CADY, American botanist, son of Amos B. Eaton; born at Fort Gratiot, Mich., in 1834; graduated at Yale in 1857, and at Lawrence Scientific School (Harvard) in 1860; became professor of botany at Yale in 1864. He contributed to *Gray's Manual*, and to Chapman's *Flora of the Southern States*, the parts relating to ferns, and published *The Ferns of North America* (1879-80). Died June 29, 1895.

EATON, DORMAN BRIDGMAN, b. Vt., 1823; graduated at the univ. of Vermont and at the Harvard law school; and began the practice of law in New York, 1850. He has given much attention to political and municipal affairs, and has been largely engaged in civil service reform. At the request of Pres. Hayes he wrote a historical report on the *Civil Service in Great Britain*, 1879. He was the author of the law creating the board of health of New York, and of the national civil service act of 1883, and was a commissioner under the act in 1883-5.

EATON, EDWARD DWIGHT, educator; b. Lancaster, Wis., Jan. 12, 1851; graduated at Beloit college in 1872, and at the Yale theological seminary in 1875; studied at the universities of Leipzig and Heidelberg; held a Congregational pastorate at Oak Park, Ill., in 1880-86; and was elected president of Beloit college, Wis., in the last year.

EATON, GEORGE WASHINGTON, D.D., LL.D., 1804-72; b. Penn.; Baptist clergyman, educated in Ohio university and Union college, tutor in the last named institution in 1829. In 1831 he was professor of ancient languages in Georgetown (Ky.) college; 1832-50, professor of mathematics, natural philosophy, and ecclesiastical and civil history in the literary and theological institution at Hamilton, N. Y.; afterwards at the same place professor of systematic theology; 1856-68, president of Madison university; also, 1861-71, president of the theological institution.

EATON, JOHN, JR., LL.D., b. N. H., 1829; graduated at Dartmouth in 1854, studied theology at Andover theological seminary; ordained by the Maumee (O.) presbytery, 1861; commissioned chaplain of the 27th Ohio volunteers, 1861; appointed by Gen. Grant superintendent of contrabands, 1862; general superintendent of freedmen for Mississippi, Arkansas, w. Tennessee, n. Louisiana, 1862, serving till May, 1865. He was commissioned col. of the 63d colored troops, 1863; breveted brig. gen. of volunteers, 1865; assistant commissioner of the bureau of refugees, freedmen, and abandoned lands, 1865; state superintendent of public instruction for Tennessee, 1867-69; U. S. commissioner of education, 1870-85; president of Marietta college, 1885-91. He published many reports, chiefly upon education and public affairs; and established and edited, 1866-70, the *Memphis Daily Post*.

EATON, MARGARET L., 1796-1879; the wife of John Henry Eaton, sec. of war under Pres. Jackson. Pres. Jackson demanded of his cabinet a public recognition of Mrs. E., which was refused by all except Van Buren, sec. of state. The president then requested Van Buren to resign, and appointed him minister to England; but owing to Calhoun's opposition, the senate failed to confirm him. Mrs. E. was, in later years, brilliantly successful in society in London, Paris, and in Madrid, where her husband was stationed as minister to Spain. After the death of Gen. Eaton she married an Italian teacher. Her last years were spent in seclusion at Washington.

EATON, THEOPHILUS, about 1591-1658; b. Oxfordshire, England; became a merchant; went to New England in 1637; was chosen a magistrate in Massachusetts; aided in settling a colony at Quinnipiac in 1638 and in forming the government of the New Haven colony in 1639; and was governor of the colony till his death.

EATON, WILLIAM, 1764-1811; b. Conn.; at 16 years of age entered the revolutionary army and served through the war. Entering Dartmouth college, he graduated in 1790, and in 1792 was made a capt. in the regular army; in 1797 sent as diplomatic agent to Tunis, where he succeeded in putting an end to the outrages of the corsairs of that country upon American ships. In 1803 he returned, but the next year went back as navy agent of our government for the Barbary states. There was at the time a contest for the throne of Tripoli, with which country this nation was at war. Eaton found that the rightful bey, or ruler, had taken refuge in Egypt. He went to him, assisted in raising a force of 500 men, marched 600 m. over the Libyan desert, secured the assistance of the American fleet, and captured Derne after a furious assault, in which he was wounded. The reigning bey came against him and desultory warfare followed. June 11, 1804, a general engagement took place, and the usurping bey was defeated. Eaton was about to march to Tripoli, install the rightful ruler, and release a large number of American captives, when news arrived that peace with Tripoli had been concluded by the American consul at Algiers. This put an end to his work, and he returned home. He settled in Mass., whose legislature gave him 10,000 acres of land, and later he was elected to the legislature. In 1806 Aaron Burr tried to engage him in the south-western conspiracy, but without success, and on Burr's trial Eaton was a witness against him.

EATON, WILLIAM WALLACE, b. Conn., 1816; engaged in the practice of law; was a member of the house of representatives for nine sessions; speaker of the house, 1853 and 1873; in state senate, 1850; was elected to the U. S. senate as a democrat, 1874; and was elected representative to the XLVIIIth congress, 1882. He was known as a vigorous party leader in both state and national politics.

EATON, WYATT, b. Canada, 1849; studied under Gérôme in Paris; for some years occupied a studio in New York, devoting himself to landscape and portrait painting. He was the first sec. of the society of American artists, and to their exhibition he sent his portrait of William Cullen Bryant, 1878. Among his paintings are "Reverie," and "Harvesters at Rest." He d. in 1896.

EATON HALL, one of the famous "show-places" of England, the residence of the Duke of Westminster, a descendant of Hugh Lupus, and the richest peer in England. It is beautifully situated on the river Dee, $3\frac{1}{2}$ miles from Chester, whence a small steamer leaves daily for Eaton hall. The hall, which is the fourth on the site, is purely modern, erected 1870-82 by the architect Waterhouse. It is a remarkably fine specimen of Gothic architecture, and is adorned with all the resources of modern art and fitted up with the most lavish expenditure. A well-timbered park, stocked with herds of deer, surrounds it, and gardens and terraces of much beauty are open to the visitor, as is also the stud-farm, which contains several famous racers, such as Bend Or and Shotover. The park is very extensive, the mansion being nearly three miles from the lodge gates. Some fine paintings are exhibited in the various apartments, among them specimens of Rubens, Benjamin West, and Millais. Eaton hall is annually visited by many Americans, and is in many ways a typical modern English aristocratic mansion.

EATON RAPIDS, a city in Eaton co., Mich.; on the Lake Shore and Michigan Southern railroad, 100 miles w. of Detroit. It has banks, churches, newspapers, machine-shops, woolen and lumber mills, flour mills, plow works, fruit evaporator, and large bean picking and shipping plants. There are several noted chalybeate springs here. Pop. '90, 1970.

EATONTOWN, a town in Monmouth co., N. J., on the New Jersey Central railroad, 4 miles w. of Long Branch, 30 miles from New York. It has several churches, public schools, flour mill, tomato works, hat factory, electric lights and railroad connecting with Atlantic Highlands, Red Bank, and Long Branch, and the Monmouth Park race track. Pop. '90, 2953.

EAU CLAIRE, a co. in w. Wisconsin, on Chippewa and Eau Claire rivers; 648 sq. m.; pop. '90, 30,673. The surface is uneven, and the soil fertile; principal productions, wheat, corn, oats, and butter. Co. seat, Eau Claire.

EAU CLAIRE, a city and co. seat of Eau Claire co., Wis., at the junction of the Eau Claire and Chippewa rivers, and at the head of steamboat navigation on the latter; on the Wisconsin Central and other railroads, 90 m. from St. Paul. It is the chief commercial point in n.w. Wisconsin; is the outlet of the Chippewa lumber district; has good water-power from both streams, and manufactures over 300,000,000 ft. of lumber annually. There are iron foundries, a linen mill, and manufactories of furniture, refrigerators, sashes and doors, shoes, and electrical machinery and appliances. The city has electric railroads, water-works, public parks, opera-house, a public library, high school, Sacred Heart hospital, national and other banks, and daily and weekly newspapers. Pop. '80, 10,119; '90, 17,451.

EAU DE COLOGNE, a celebrated perfume, invented long ago by the Farina family in Cologne, and since manufactured chiefly by members of the same family; but perfumes bearing the same name are now made in various parts of the world. It consists principally of spirits of wine, along with numerous essential oils harmoniously mingled together, so as to produce a refreshing and grateful scent. The recipe said to be followed in the manufactories at Cologne is twelve drops of each of the essential oils—neroli, citron, bergamot, orange, and rosemary, along with one dram of Malabar cardamoms, and one gallon rectified spirit. The whole is distilled together, and the condensed liquid constitutes Eau de Cologne.

EAU CRÉOLE, a very fine liqueur, made in Martinique, by distilling the flowers of the mamee apple (*mammea Americana*) with spirit of wine.

EAU DE JAVELLE is a solution of hypochlorite of potash, which, when administered to man, is stated to act powerfully on the nervous system, and to give rise to general rigidity, and even to cause tetanic spasms.

EAU DE LUCE is the name given to a preparation which was formerly a very popular stimulant, and is still occasionally used. It is a mixture of oil of amber with alcohol and ammonia, and has a milky appearance. It had a great reputation in cases of snake-bites.

EAU DE VIE. See BRANDY.

EAU FORTE. See AQUA FORTIS.

EAUX BONNES, a fashionable watering-place of France, in the department of Basses-Pyrénées, is situated 20 m. s.e. of Oloron. It stands in a narrow gorge surrounded with rocks, and consists of a street of about 30 large and well-built hotels and lodging-houses. On the opposite side of the street there is an open space laid out as a shrubbery and planted with trees; it is called the Jardin Anglais. E. B. is much frequented on account of its hot sulphureous springs, which are four in number, and are used for bathing purposes. Their temperature does not exceed 91° F. There is also a cold spring here, which is used for drinking. The springs are said to be very valuable, on account of their power of checking the progress of incipient consumption, and of curing various affections of the lungs and chest. The season of the E. B. lasts from June to Oct., and during that time it is crowded with visitors and patients. Permanent pop. '91, 735.

EAUX CHAUDES, LES, 3 m. s.w. of the preceding, is a similar place of resort. Its springs have the same properties as those of the Eaux Bonnes.

EAVES, in architecture, the edge of a sloping roof which overhangs the wall, for the purpose of throwing off the water. When there is no concealed gutter at the margin to conduct the water to spouts or pipes, but the water is allowed to run from the roof to the ground, they are called *dripping eaves*.

EAVESDRIIP, or **EAVESDROP** (Ang.-Sax. *yfesdrype*). "The owner of a private estate," says Kemble (*Saxons in England*, vol. i. p. 45), "was not allowed to build or cultivate to the extremity of his own possession, but must leave a space for eaves. The name for this custom was *yfesdrype*." The space was regulated by the charter by which the property was held. In a charter of 868 A.D., it is limited to 2 feet. This Saxon custom corresponded to the well-known urban servitude of the Romans called *stillicide* (*stillidium*). The eavesdrop was the water which dropped from the projecting roof, and in this sense is opposed to the water collected in a spout, to which the Romans gave the name of *flumen*. Similar regulations existed in Greece, and have probably existed in all countries.

EAVES-DROPPERS "are such as listen under walls or windows, or the eaves of houses, to hearken after discourse, and thereupon to frame slanderous or mischievous tales."—Blackstone's *Comm.* iv. 163. Such persons are, by the law of England, regarded as common nuisances; they may be indicted at the sessions, and on conviction are punishable by fine. Persons who by their conduct expose themselves to suspicion of an intention to commit this offense, may be brought before a magistrate, and required to give security for their good behavior; 34 Edw. III. c. 1.

EBAL AND GERIZIM. See GERIZIM AND EBAL.

EBB AND FLOW. See TIDES.

E'BELING, CHRISTOPH DANIEL, 1741–1817; b. Hanover. He was famous for extensive knowledge of oriental languages, classic literature, and geography and history. The congress of the United States gave him a vote of thanks for his *History and Geography of North America*. He made a collection of about 4000 books and 10,000 maps relating to America, which is now in the library of Harvard university.

EBENA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with alternate leathery leaves, and axillary flowers, which are monopetalous, somewhat leathery, and generally unisexual; the fruit fleshy. They have not a milky juice. They are regarded as allied to *aquifoliaceæ* (holly, etc.), *apocynaceæ*, and *oleaceæ*. About 160 species are known, mostly tropical, but a few are natives of Europe, and other temperate countries. The wood is in general remarkable for its hardness, as the different kinds of ebony (q.v.) and other species of *diospyros*; and on account of this quality, even that of species which never attain the ordinary size of timber trees is sometimes

accounted valuable, as of *royena lucida*, the African bladder-nut or zwart-bast, at the cape of Good Hope; where also that of *euclea undulata*, a hard brown wood, is esteemed for cabinet-work. The fruit of many species is eatable. See DATE PLUM. The fruit of *embryopteris gelatinifera* contains a viscid juice, and is used in all parts of India for paying boats.

EBENEZER, the name of a place marked by a monumental stone set up by Samuel in recognition of divine assistance in a battle with the Philistines. Its location cannot be satisfactorily determined. The name means "Stone of the help."

EBERHARD, AUG. GOTTLOB, a well-known German author, was b. at Belzig, in 1769, studied at Leipsic and Halle, and first attracted attention by his contributions to a periodical devoted to *belles-lettres*, entitled *Ida's Blumenkörbchen* (Ida's Flower-basket). Among his numerous works may be mentioned *List um List, oder was ein Kuss nicht vermag* (Trick for Trick, or what could not a Kiss do); *Ysop Lafleur's Sämmtliche Werke* (Ysop Lafleur's Collected Works); *Ferdinand Werner, der Arme Flötenspieler* (Ferdinand Werner, the poor Flute-player); and *Ischarioth Krall's Lehren und Thaten* (Ischariot Krall's Doctrines and Doings); *Hännchen und die Küchlein* (Jenny and the Chickens), a narrative poem in ten parts, which has gone through many editions, and been often translated into other languages; and *Der erste Mensch und die Erde* (The First Man and the Earth), a poem marked by simple dignity and lively representation. E., after a life of hard literary work, died at Dresden, 18th May, 1845.

EBERHARD, IM BART (Ger., with the beard), Count, and afterwards first duke of Württemberg; 1445-96; the second son of count Ludwig I. He succeeded his elder brother, Ludwig II., at the age of 12, and before he was 14 wrested the government from his uncle Ulrich, who had been appointed his guardian. His tutor was the learned John Naclerus, but Eberhard profited little by his learning, indulged his passions, and led a dissipated life. In 1468, he made a pilgrimage to Jerusalem, after which he abandoned his reckless mode of living, and became one of the most popular princes of Germany. He married Barbara, daughter of Lodovico di Gonzaga, whose influence over him contributed largely to the elevation of his character. He began to study, gathering around him men of learning; and at the solicitation of his wife founded in 1477 the university of Tübingen. In 1482, Eberhard, by the treaty of Minzingen, put an end to the evils which had arisen from a division of the county made in 1437 between his father and his uncle Ulrich, as representatives of the two lines of Urach and Stuttgart. By this treaty he secured the future indivisibility of Württemberg and the right of primogeniture in his own family; he became at the same time the founder of the representative constitution of Württemberg. He made Stuttgart his place of residence, and improved the laws and condition of the convents in his country. Though a lover of peace, he knew how to bear the sword when war was necessary; and by his courage and fidelity to his engagements secured the esteem and friendship of the emperors Frederick III. and Maximilian I. In recognition of his services, the emperor at his first diet, held at Worms in 1495, raised Eberhard to the dignity of duke, confirming at the same time all the possessions and prerogatives of his house; but Eberhard did not long enjoy his new dignity. His two children died in infancy, and with his death the line of Urach became extinct.

EBERHARD, JOHANN AUGUST, a philosophical writer of Germany, was b. at Halberstadt, 31st Aug., 1739; studied theology at Halle, 1756-59; and after spending several years as a preacher in Berlin and Charlottenburg, became professor of philosophy at Halle in 1778, and doctor of theology in 1808. He died 6th Jan., 1809. E.'s first work was his *Neue Apologie des Socrates* (New Apology of Socrates), 2 vols., Berlin, 1772; a work in which the rights of common sense are vindicated against the accusations of a narrow theology. It was received with much applause both in Germany and in other countries. Among his other writings may be mentioned *Sittenlehre der Vernunft* (Ethics of the Reason), Berlin, 1781; *Theorie der schönen Künste und Wissenschaften* (Theory of the Fine Arts and Sciences), Halle, 1783; *Allgemeine Geschichte der Philosophie* (Universal History of Philosophy), Halle, 1788; *Handbuch der Aesthetik* (Manual of Æsthetics), 4 vols., Halle, 1803-5; and *Versuche inder allgemeinen Deutschen Synonymik* (An Attempt towards a Complete Work on German Synonyms), 6 vols., Halle, 1795-1802, a work which was enriched and improved by Maas, 1818-21, and again by Gruber, 1826-30, but which was, at the time of its appearance, the best thing of the kind in the German language. Towards the close of his life, E. struggled, but without success, against the speculative excesses of the new schools of philosophy headed by Kant and Fichte. E. was a clear and sensible thinker, as well as an agreeable and interesting writer.

EBERHARD, KONRAD, 1768-1859; b. Bavaria; studied in Munich and Rome; sculptor and painter; became professor of sculpture in the Munich academy of fine arts. Many of his paintings illustrate the progress and triumphs of Christianity. Of his sculptures, the best known are the statues of St. Michael and St. George at the Isargate, Munich; and the tomb of the princess Caroline.

EBERNBURG, a small t. in the Bavarian palatinate, is situated about 20 m. s.w. of Mayence, at the junction of the Alsenz with the Nahe. It is notable on account of the ruins of its castle, which formerly belonged to the famous knight Franz of Sickingen,

who was a devoted friend of the early reformers. His stronghold, which was once considered almost impregnable, afforded a secure retreat from danger and persecution to Melancthon, Bucer, Ecolampadius, and Ulrich von Hutten, the last of whom composed several of his works here. After the death of Sickingen, the castle of E. was besieged and dismantled by the electors of Hesse and Treves.

EBERS, GEORG MORITZ, b. Berlin, 1837; studied at Göttingen and Berlin; taught in the university of Jena; and became professor of Egyptology in Leipzig University in 1870. He paid especial attention to Egyptian archaeology; discovered in Egypt in 1872-3 the papyrus since named after him; and published *An Egyptian Princess; Egypt and the Books of Moses; Through Goshen to Sinai; Uarda; Homo Sum; The Sisters; Margery; The Story of my Life; Per Aspera; Cleopatra* (1894); *In the Fire of the Forge* (1895); *In the Blue Pike* (1896), etc.

EBERT, KARL EGON, a Bohemian poet, was b. at Prague, 5th June, 1801; was educated there and at Vienna; and after filling several situations, settled in Prague. The honor of knighthood was conferred on him in 1871. His chief works are his *Dichtungen* (2 vols., 1824; 3d ed., 1845); *Wlasta, ein Böhmisches nationales Heldengedicht in drei Büchern* (Wlasta, a Bohemian National Heroic Poem, in three books), Prag. 1829; and *Das Kloster, idyllische Erzählung in fünf Gesängen* (The Cloister, a Narrative Idyl, in five cantos), Stutt. 1833. These poems, especially the last two, are marked by lyrical vehemence, and elegance of language. They were received with applause, particularly in Bohemia, whose national traditions form their ground-work. E.'s compositions show a happy union of the German and Czech characteristics. He likewise wrote a large number of dramas, of which *Das Gelübde* (The Vow, 1864) was received with public favor at Prague. He has also published some meritorious lyrical poetry; d. 1882.

E BIONITES (Heb. *ebion*, poor), a name probably given originally by the hierarchical or influential party among the Jews, to those of their countrymen who professed the Christian faith, and who generally belonged to the poorer and more ignorant class (John, chap. vii., verses 48, 49). Subsequently, it would seem, the Gentile Christians, who were ignorant of Hebrew, employed it in a distinctive sense to designate their Jewish co-religionists, who, in addition to their belief of Christianity, observed the Mosaic law. Irenæus is the first writer who makes use of the name. It is highly probable that the E. first became an organized body or sect at Pella, a city in Peræa, on the eastern side of the Jordan, whither they had betaken themselves on the breaking out of the Roman-Jewish war in the time of Hadrian. Here, indeed, a strictly Jewish-Christian church continued to exist down to the 5th century. Among the E., however, there was by no means a unanimity of religious feeling, or uniformity of opinion. Two great divergent parties are clearly recognizable—the E. proper, and the Ebionitic Nazarenes. The former were little different from Jews: their conceptions of the Saviour were meager and unspiritual. They believed that Jesus was simply a man distinguished above all others for legal piety—pre-eminently a Jew, and selected as the Messiah because of his superior Judaism. Of course they denied his supernatural birth, yet not his resurrection; for “they lived in expectation of his speedy return to restore this city of God (Jerusalem), and to re-establish the theocracy there in surpassing splendor.”—Neander. They were the genuine descendants of those Judaizers who plagued the church in the time of the apostle Paul. The Ebionitic Nazarenes, on the other hand (who at the close of the 4th c. seem to have dwelt chiefly about Beroæa in Lower Syria, but at an earlier period may have been more widely diffused), were Jewish Christians, in the better sense of the term. They conceived it to be their *own* duty still to circumcise, keep the Sabbath, etc., but they had no wish to impose the peculiarities of Judaism on the Gentile Christians. They did not believe that Christianity was merely a glorification of Judaism, but a new life come into the world, in which the Gentile might at once participate, without undergoing a Mosaic ordeal. Like the stricter E., they used a *Gospel of Matthew*; but it contained what the other did not—an account of the supernatural conception and birth of the Saviour. According to Neander, who has very thoroughly investigated this question, there were a great many varieties of opinion among the E., springing out of the differences above spoken of, which it would be tedious to record. It is sufficient to say that *Essenism* modified Ebionism greatly, through the introduction of a Jewish mysticism, which recognized in Moses and Christ an inward identity of doctrine, and regarded them as revealers of the “primal religion,” whose teaching, however, had been sadly corrupted. See CLEMENS, TITUS FLAVIUS; ESSENES.

EBLIS, in the Mohammedan religion, the chief of the fallen angels, the angel of “despair” (Eblis), who was once a good angel named Azazil, but having refused to render homage to Adam, was banished by God to wander over the earth until the resurrection.

EB'OLI (ancient *Eburæ*), a small t. of southern Italy, in the Principato Citeriore, about 16 m. e.s.e. from Salerno, is picturesquely situated at a considerable elevation above sea-level. The climate, which does not become too cold in winter, notwithstanding the position of the town, is very unhealthy in summer, owing to the number of streams in the neighborhood. Pop. est. at over 9000.

EBONY (Lat. *ebenum*; but originally from the eastern name), a wood remarkable for its hardness, heaviness, and deep black color, is the heart-wood of different species of

diospyros, of the natural order *ebenaceæ*, the same genus which produces the date plum (q.v.), kaki, and other fruits. The best E., excelling in uniformity and intensity of color, is the produce of *D. ebenum*, which grows in great abundance in some of the flat parts of Ceylon, and is a tree of such magnitude, that logs of its heart-wood, 2 ft. in diameter, and varying from 10 to 15 ft. in length, are easily procured. *D. melanoxylon*, the E. tree of Coromandel, yields E. of good quality; *D. tomentosa*, *D. roylei*, and other Indian species, also yield it. In Mauritius and Madagascar, E. of very good quality is produced by *D. reticulata*. Other species of *diospyros* are much valued for their beautiful timber, very different in color from E., as calamander wood (q.v.) and cadooberia (*diospyros ebenaster*). The last-named species is found in India and Ceylon. The prevailing black of the wood is beautifully striped with a rich yellowish-brown; but in density and durability it is far inferior to ebony.—E. is chiefly used by cabinet-makers for veneering. The ancient Greeks and Romans were acquainted with it; and it is supposed that they obtained it either from India or Madagascar. They frequently inlaid it with ivory, for contrast of color. It is mentioned by Ezekiel (xxvii. 15) as an article of Tyrian commerce. It was at one time used in medicine, as a laxative and sudorific; it has a somewhat pungent taste.—The name E. is sometimes given to the black wood of trees very different from those of the genus *diospyros*. An Abyssinian tree called mozzungha (*fornasinia*), of the order *leguminosæ*, produces a black heavy wood, much resembling ebony.—WEST INDIAN E. or AMERICAN E., is produced by *brya ebenus*, also of a natural order *leguminosæ*, but the wood is of a greenish-brown rather than a black color. It receives a good polish, is very hard and durable, and much sought after by musical-instrument makers. It is one of the articles of export from the West Indies to Britain. But the tree is of small size, seldom more than 12 ft. high, and the trunk only a few inches in diameter.

EBRO (Lat. *Iberus*), an important river of Spain, rises in the province of Santander, at a point greatly elevated above the level of the sea, about 12 m. n.w. of Reynosa, flows s.e. for about 25 m.; then e. past Frias, after which it maintains a general s.e. course, passing Miranda, Haro, Logroño, Tudela, and Zaragoza, when it turns n., passes Mequinenza, flows s.e. to Mora, s. to Tortosa, and finally e. to the Mediterranean, into which it falls after a course of about 470 miles. Its mouth is choked up with sand, and, to render it navigable, a canal called the San Carlos has been carried through the delta. Its principal affluents are the Najerilla, Jiloca, and Guadalope from the right, and the Aragon, Gallego, and Segre from the left. The course of the E. is chiefly through narrow, and sometimes rocky valleys; and its bed is characterized by many shoals and rapids which interrupt the navigation. This is partly remedied, however, by means of the Imperial canal, which extends from the vicinity of Tudela to a point 40 m. below Zaragoza.

EBULIOSCOPE, an instrument for ascertaining the strength of distilled liquors by observing the boiling point and the atmospheric pressure.

ÉCARTÉ, a game at cards, probably first played early in the present century in Paris, though it appears to have grown out of an old game called *la triomphe*, or French-ruff. It is usually played by two persons, though sometimes by three, the third player taking the place of the loser in the first game, and the pool not being taken except by the winner of two games in succession. In French *écarté*, bystanders are permitted to advise, and the player losing leaves the table, his adviser taking his place. If, however, the loser is playing *la chouette* (i.e., taking all bets offered), he need not retire on losing. The small cards are removed from a pack, and the player cutting highest deals. He gives five cards, by two and three at a time, to his opponent and himself, and turns up the eleventh card for trumps. The trump card, if a king, counts one for the dealer. His adversary, if satisfied with his hand, plays; if not satisfied, proposes, and the dealer can accept or refuse. Should he accept, each may discard, face downward, as many cards as he may choose, receiving fresh ones from the cards yet undealt, these being given first to the non-dealer, till his hand is complete. A second proposal and a third may be made, and so on till the player is satisfied; but if the dealer refuse, the hand must be played without discarding. The king of trumps scores one if in either hand. The non-dealer being satisfied with his hand, leads; the dealer follows; and the trick is taken by the highest card, or the trump. The king is the highest. The winner of a trick leads to the next. The second player must follow suit, and must win the trick if he can. The game is scored by the king, as explained, and the majority of tricks. Three tricks score one for the point; all five tricks won by one player score two for the *vole*. When the non-dealer does not propose, or his proposal is refused, and he fails to gain three tricks, the dealer scores two, but no more even though he win the *vole*. The game is five up.

ECBATA'NA (Agbatana, Achmêta, Hagmatana), the ancient capital of Media, situated at a distance of 12 stadia (about $1\frac{1}{2}$ m.) from Mt. Orontes, the modern Elwend. Its foundation was attributed by popular belief to Solomon or Semiramis, while the book of Judith ascribes it to Arphaxad (Phraortes?), and Herodotus to Deioces (728 B.C.). It lay upon a conical hill, crowned by a temple of the sun, and was inclosed by seven concentric walls, the innermost of which was gilded, and the next plated with silver; while the rest, in their order outwards, were painted orange, blue, scarlet, black, and white, respectively. As they rose in gradation towards the center, all the battlements

with their gorgeous hues—probably representing, in Sabæan fashion, the seven planetary spheres or the seven climes—were visible at once. The city is reported to have been 250 stadia in circumference. Its principal buildings were the citadel—a stronghold of enormous dimensions, where also the archives were kept, in which Darius found the edict of Cyrus the great concerning the rebuilding of the temple in Jerusalem—and the royal palace. Cedar and cypress only were used for the woodwork, and the ceilings, beams, and rafters were overlaid with gold and silver. The mild climate and the magnificence of its structure singled out E. as the favorite summer residence, first of the Median, then of the Persian, and, lastly, of the Parthian monarchs. After the battle of Arbela (331 B.C.), Alexander followed Darius thither, and secured an immense booty. It was again pillaged by the Seleucidæ; but such were the riches of this place, that Antiochus the great still found 4,000 talents' worth of silver to carry away. E. subsequently fell into the hands of the Parthians; and it has since so utterly sunk into decay, that notwithstanding the frequent mention that is made of it both in the Bible and in classical writings, its very site can no longer be fixed with certainty. Gibbon and Jones tried to identify it with Tabriz or Tauriz; Williams, with Isbahan; while recent explorers, such as Rennell, Mannert, Kinneir, Morier, and Ker Porter, generally agree that the present Hamadan, with the supposed tombs of Mordechai and Esther (see HAMADAN), occupies the site of ancient Ecbatana. Sir Henry Rawlinson assumes two Ecbatanas, one the present Hamadan, the other the present Takhti-Suleiman, 36° 25' N. lat., 47° 10' W. long. Both the orthography of the scriptural Achmêta, and the cuneiform Hagmatana in the Behistun inscriptions, which, by changing the *m* into *b*, became Agbatana in Greek, seem to point to Hamadan. Broken columns, a few cuneiform inscriptions, coins, medals, and a fragmentary stone lion, placed there, according to the Eastern legend, by the sorcerer Apollonius of Thyane, at the command of Nebuchadnezzar, in order to guard the town from excessive cold and snow—all dug out near Hamadan—are all that now remains of that once most royal of cities. There was another ECBATANA in Persia, which was given to the Magi; and a third in Syria, at the foot of Carmel, the present Kaiffa, where Cambyzes, the son of Cyrus, suddenly died 520 B.C.

ECCALEO'BION, an oven for hatching eggs. The eggs are placed on shelves one above the other, so fixed that the eggs can be turned over once in a day or two. The proper temperature is provided by steam or warm water. Artificial hatching was one of the most ancient inventions of Egypt. Perhaps the idea was taken from the hatching of eggs in the hot sand of that country. See INCUBATION.

ECCARD, JOHANNES, 1553–1611; b. Prussia; a composer of church music. He was a pupil of Orlando Lasso, at Munich. In 1583, he became assistant conductor, and in 1595, chapel-master, at Königsberg. In 1608, he was chief conductor of the elector's chapel in Berlin, where he died. His works are songs, sacred cantatas, and chorales. He set to music the great national hymn of the Germans, *A Mighty Fortress is our God*, (Luther's *Ein feste Burg ist unser Gott*). Many collections of his songs are extant.

ECCE HOMO (Lat. "Behold the man"), the name usually given by artists to paintings representing Christ bound and crowned with thorns previous to his being led forth to crucifixion. On this exalted subject the highest efforts of art have been employed. The finest "Ecce Homo" is that of Correggio, in the National Gallery, London; the whole conception of this remarkable picture being of the first order of genius. Other conceptions have been painted, such as that of Guido. See Dr. Waagen's *Art and Artists in England*.

ECCENTRIC, in machinery, is a contrivance for taking an alternating rectilinear motion from a revolving shaft. It consists of a circular disk or pulley, fixed on a shaft or axis which does *not* pass through the center of the disk. The disk has a groove upon its circumference in which the hoop—by means of which the rod is attached to the disk—slides. As the eccentric revolves with the axis, the hoop is alternately raised and lowered, and with it the rod which is keyed into it. The extent of the rise and fall of the rod is equal to twice the distance between the centers. The E. is chiefly used where a subsidiary motion of small power is required; as for working the force-pump that supplies the boiler of a steam-engine (q.v.).

ECCENTRIC, or **ECCENTRIC CIRCLE** (in the Ptolemaic astronomy). It was a fundamental doctrine with the ancient astronomers, that every heavenly body moved in a circle (the perfect figure), and at a uniform rate. To move otherwise than uniformly and in the perfect figure, would have been unbecoming a heavenly body! But some of them appeared to misbehave by moving unsteadily, and in other figures than circles. Of course, this was a mere deceptive appearance; but then, to save the fundamental doctrine, it must be explained. To explain it, they invented the *eccentric* circle. Suppose a body, such as the sun, to move in a circle at a uniform rate, and a spectator to observe it, not from the center of the circle, but from a point half way between the center and the circumference. Then it is evident that, by hypothesis, to an observer at the center of the circle, the motion of the sun is uniform; i.e., the sun travels through equal angular distances in equal times. When, however, the observer is located at the second point, the angular distances traveled through in equal times are unequal. If, then, the earth, instead of being at the center of the sun's orbit, be in a position away

from it, the want of regularity in his movements will be explained. Accordingly, to reconcile the observed fact with the fundamental doctrine, the ancients placed the earth at a point away from the center of the sun's supposed orbit. Hence this orbit was called the *eccentric*, in respect that its center did not coincide with that of the earth, which was considered as the center of the universe.

EOCENTRICITY. In the ellipse and hyperbola (q.v.), the E. is the ratio of half the distance between the foci to the semi-major axis. In older mathematical works, E. is sometimes used as the name of half the distance between the foci of an ellipse or hyperbola.

ECHELLENSIS, OR ECHELLENSIS, ABRAHAM, b. Syria, near the close of the 16th c.; educated in the Maronite college in Rome, and professor of Arabic and Syriac in the college of the Propagandists. In Paris, he assisted in the preparation of Le Jay's Polyglot Bible. He published several Latin translations of Arabic works, and was engaged in a controversy with Selden as to the historical grounds of episcopacy. D. 1664.

ECCHYMO'SIS (Gr. from *ek*, out of, and *chymos*, juice), a discoloration of the surface, produced by blood effused below, or in the texture of, the skin. It is usually attended by swelling to a greater or less extent, and is the result of injury. The presence of E. is sometimes adduced in courts of law as a proof of violent injuries having been inflicted during life, or very shortly after death.

ECGLEFECHAN, a small village of Dumfriesshire, Scotland, twenty miles north of Carlisle, and on the Caledonian railroad. Thomas Carlyle was born and buried here, and the village is believed to be the "*Entepfuhl*" of his *Sartor Resartus*.

EC'GLESFIELD, a township in the West Riding of Yorkshire, 5 m. n. of Sheffield. Pop. '91, 25,890. The chief manufacture is cutlery, but flax, linen, and nails are also branches of industry. There are coal and iron mines in the vicinity.

ECCL'E'SIA. I. The great assembly of the Athenians in which all free citizens might vote. Its authority was supreme, but, as in the growing power of the higher classes it was after a time seldom convened, the entire management of the state fell into the hands of the archons, who were chosen from the aristocratic classes. Solon (B.C. 594) ordained that it should meet monthly, on established days, and at other times when emergencies arose. It was convened by the *prytanes*, was presided over by the *epistates*, and, after it had been constituted by the offering of sacrifice and prayer, the *proedroi* announced the subjects for consideration, which had already been acted on by the senate, but required the consent of the people before they could become laws. Citizens who were over 50 years of age were first invited to speak; afterwards any one over 30 might be heard. The voting was by stretching forth the hands, or by depositing beans and stones in vessels prepared for them. When the business had been finished the *prytanes* dismissed the E. In Sparta, also, there were assemblies of the same name. One kind, composed only of citizens of Sparta itself, was called the little E. It met once a month, at first in the open air and afterwards in a building erected for the purpose. Any citizen over 30 years of age might speak. Another kind, called by way of eminence the E., was composed of the kings, senators, magistrates, and delegates from all the towns and cities of the province of Laconia. It had cognizance of all affairs of common interest and importance to the whole state. The voting at Sparta was by acclamation, and not by ballot. The majority was determined by the comparative volume of sound, or, if that was doubted, by a division and counting of the two parties. II. In the Greek of the New Testament, E. is the name for the company of Christ's disciples professing to trust in him as their Saviour and to obey him as their Lord. It is applied to a small assembly of them, such as were members of one family, or could meet in a dwelling-house of ordinary size; to the whole number in one city or neighborhood; to the whole number on earth; to all that are in heaven; and to the innumerable company on earth and in heaven. It has other meanings, but is usually rendered *Church*.

ECCL'ESIAS' TES (Eng. the Preacher), the title (taken from the Septuagint) of a canonical book of the Old Testament; its Hebrew name is *Kohleth*, which signifies nearly the same. The inscription with which it commences is: "The words of Kohleth, the son of David, king in Jerusalem." Its authorship is commonly ascribed to Solomon. In support of this opinion, however, there is not a vestige of internal evidence except what arises from the dramatic use of his name, an expedient in all probability resorted to by the writer to give force and emphasis to his own reflections, inasmuch as Solomon was held by the Jews to be the perfection of human wisdom. The first who doubted the Solomonian authorship of the book was Grotius. Later critics have advanced further than Grotius. The actual writer probably flourished, according to Dr. Davidson, in the later period of the Persian government, not long after the time of Malachi, i.e., 350-340 B.C. Such is also substantially the opinion of Rosenmüller, Knobel, Ewald, and De Wette. Hengstenberg, unquestionably the ablest critic of the orthodox German school, considers that the contents of the book may best be explained by supposing the author to have lived in a period like that of Malachi, in which there prevailed a pharisaical self-righteousness, and melancholy murmurings against the providence of God. The dates assigned to it by Hartmann (viz., the period of the Maccabees) and by Hitzig (204 B.C.)

cannot well be sustained, as there is no trace in the book either of Grecian philosophy or language.

The chief arguments against the Solomonian authorship are *three*. 1. The writer indicates unconsciously his own posteriority in point of time by making Solomon say: "I was king over Israel in Jerusalem" (chap. i. verse 12); a thing which Solomon could not have said during his life, for he was king to the end of it. 2. The condition of the country in the time of the writer, the oppression, judicial injustice, the elevation of fools and slaves to high offices, etc., do not fit the reign of Solomon at all, nor any preceding period. 3. The language is post-exilian. Ewald, the greatest of recent orientalists, asserts that "the Hebrew is so strongly penetrated with Aramæan, that not only single often-recurring words are entirely Aramæan, but the foreign influence is infused into the finest veins of the language."—(Dr. Davidson in vol. ii. of Horne's *Introduction to the Holy Scripture*.)

It is extremely difficult to ascertain the stand-point of the author. He is deeply convinced that "all is vanity and vexation of spirit," but whether this conviction springs wholly from a religious view of life, or is in part caused by personal disappointments, we have not sufficient internal evidence to determine. There is much in E. that, if it stood by itself, might be thought to be a mere product of cynical epicureanism, but it is mixed up with so much that is nobler, with a faith in God that rises high above the crushing considerations of the vanity of all mortal life, and the book terminates so grandly, that it seems more reasonable to believe that the aim or intention of the writer was moral and religious, and not cynical; that he painted the folly, weakness, and helplessness of men in such strong colors, only that he might destroy their self-righteousness, and cure them of that inability to read the laws of God, which self-righteousness always produces.

ECCLIASTICAL COMMISSIONERS FOR ENGLAND, "are a corporation with perpetual succession and a common seal, and with power to take, purchase, and hold real estate, notwithstanding the statutes of mortmain."—Burns' *Eccles. Law by Phillimore*. The ecclesiastical commissioners consist of all the bishops of England and Wales, the deans of Canterbury, St. Paul's, and Westminster, five cabinet ministers in addition to twelve lay members, partly appointed by the crown and partly by the archbishop of Canterbury. The lay commissioners, including all the judges, to be members of the united church of England and Ireland. 6 and 7 Will. IV. c. 77, and 3 and 4 Vict. c. 113, down to 29 and 30 Vict. c. 111. The queen is empowered, by 13 and 14 Vict. c. 94, to appoint two, and the archbishop of Canterbury one (lay members of the church of England), by the title of church estates commissioners. The ecclesiastical commission thus constituted is the result of certain reports made by commissioners previously appointed by the crown. The object of the existing commission is best explained by a reference to the instructions given to the original commissioners. "To consider the state of the several dioceses of England and Wales, with reference to the amount of their revenues and the more equal distribution of episcopal duties, and the prevention of the necessity of attaching by commendam to bishoprics benefices with cure of souls; to consider also the state of the several cathedral and collegiate churches in England and Wales, with a view to the suggestion of such measures as may render them more conducive to the efficiency of the established church; and to devise the best mode of providing for the cure of souls, with special reference to the residence of the clergy on their respective benefices." The ecclesiastical commission was permanently established in the year 1835. In order that it should be provided with a fund to enable it to carry out such schemes as should appear to it desirable, the seven best endowed sees were laid under a contribution amounting in all to the annual sum of £23,800. In addition to the income thus provided, several canonries in the various cathedrals are abolished, and other ecclesiastical preferments are extinguished, and the emoluments of the whole are vested in the commissioners. The ecclesiastical commissioners are required to lay before her majesty in council such schemes as appear to them best adapted for carrying out the purposes of the act. It is provided that no proceeding which requires the common seal of the corporation is to be finally concluded, nor is the seal to be affixed to any deed, unless two at least of the episcopal commissioners are present, and consenting. Notice of every scheme is to be given to any corporation, aggregate or sole, affected thereby; and the objections, if any, are to be laid before her majesty in council, together with the scheme. The scheme, if it receive the royal assent, is to be gazetted, and thereupon acquires the power of an act of parliament. By 19 and 20 Vict. c. 55, the duties of the church building commissioners have been transferred to the ecclesiastical commissioners. The latter body have now, therefore, in addition to their previous powers, authority to divide or to unite existing parishes, and to create new districts. Such are, very briefly, the powers of the ecclesiastical commissioners. The policy which led to the appointment of that commission is not a subject for our consideration. But it is easy to see that the influence for good and evil of so powerful an institution, over the church of England, is enormous; and it cannot be matter of surprise that its proceedings are watched with scrupulous jealousy. As a result of its deliberations during 25 years of its existence, two new bishoprics have been created and endowed, and a considerable number of small livings had been augmented.

On the other hand, it must be observed that much indignation has been excited by the expenditure of very large sums on the purchase and improvement of episcopal residences. It is, no doubt, fitting that the episcopal office should be furnished with

appliances suitable to the position and dignity of a bishop; but the peculiar character of the revenues of the ecclesiastical commissioners must be borne in mind in applying those revenues. The funds of which they are composed have been violently diverted from the original purpose of the donors. Public necessity only can justify such an act. The plea put forward is the inequality of the revenues of the clergy, and the insufficient amount of the incomes of many benefices. But it may fairly be questioned whether it is a proper application of those funds to promote the convenience and luxury of those who are already liberally endowed.

ECCLESIASTICAL CORPORATION. The holder of an ecclesiastical benefice is, by the law of England, regarded as a corporation. Ecclesiastical corporations are divided into aggregate and sole. The former consist of several persons, as the head and fellows of a college, the dean and chapter of a cathedral, and are kept up by a continual succession of members. An ecclesiastical corporation sole consists of a single person and his successors in the benefice, as a bishop, a rector, a parson, or a vicar. The object of the common law, in thus regarding the incumbent of the benefice as a corporation sole, is to preserve the temporalities which are vested in him, and which would otherwise descend to his right heirs. The right of a rector or other corporation sole to the church and glebe, though said to be a freehold, is in fact little more than a tenancy for life. He is entitled to the full enjoyment of the benefice during his life, but he cannot sell it, and he is even punishable for waste. He may work mines or pits which he finds in use, but he is not entitled to open fresh mines. His right to timber is confined to felling it for repairs, but he is not entitled to sell it. See CORPORATION.

ECCLESIASTICAL COURTS are courts specially devoted to the consideration of matters relating to the clergy and to religion. For the origin of these courts we must go back to the first days of Christianity, when the early Christians, acting upon the injunction of St. Paul—"Dare any of you having a matter against another go to law, before the unbelievers and not before the saints"—had established courts, apart from those provided by the heathen governors, for the settlement of their own disputes. These courts were presided over by the bishops, who took cognizance of all matters, temporal as well as spiritual, arising among the brethren. As Christianity advanced, and was acknowledged as the revelation of the Almighty, these bishops' courts acquired an independent position, and were suffered to exist concurrently with courts of civil jurisdiction (Code lib. i. tit. 4, *de episc. aud.*), and gradually special matters were assigned as the subjects of their peculiar jurisdiction—viz., questions of tithes, and matrimonial and testamentary causes.

All writers on the early constitution of England are agreed in the opinion that, in this kingdom, there existed no separate E. C. before the Norman conquest. Previous to that time, all matters, civil and spiritual, were in use to be heard before the county court, in which the bishop and the earl sat together. But by a charter of William I. a distinction was made for the first time between courts civil and ecclesiastical. By this charter, authority was given to the bishops to hear causes ecclesiastical according to the canon law. The bishops' courts having been thus established in England, they became a fruitful source of dispute between the crown and the see of Rome, the latter claiming supreme jurisdiction in appeal in all causes ecclesiastical. This claim was from time to time conceded by the weakness or necessity of individual sovereigns. To be as frequently retracted when the emergency was past; in particular, by 27 Ed. III. c. 1 and 16 Rich. II. c. 5, all persons were prohibited, under penalty of *præmunire* (q.v.), from resorting to the court of Rome or elsewhere. At the reformation, by 24 Hen. VIII. c. 12, on the recital that the king is, under God, the head of the church, and again, by 25 Hen. VIII. c. 21, the authority of the pope in matters ecclesiastical was finally excluded. In Bacon's Abridgment of the Law, there are enumerated ten E. C.—viz., convocation, the court of arches, the prerogative court, the court of audience, the court of faculties, the court of peculiars, the consistory court, the archdeacon's court, the court of delegates, and the court of commissioners of review. (For a full account of these courts, reference is made to the several heads, and also to the article DOCTORS' COMMONS.) Under the regulation of public worship act of 1874, a new ecclesiastical judgship was called into existence, with cognizance mainly of offenses in the matter of ritual.

The chief E. C. which have at various times existed in Scotland are the general assembly, the commissary court, and the court of teinds. The former is the tribunal for the consideration of questions of doctrine and discipline according to the Presbyterian usage, and has existed since the reformation. See ASSEMBLY, GENERAL; COMMISSARY.

ECCLESIASTICAL HISTORY, in its widest range, is the history of religious organization among men, on the basis of divine revelation, from the creation to the end of the world. It is distinct from secular history; yet so inseparably connected with it, that one can never be fully understood without the other. Ecclesiastical history is divided into two great periods by the completion of the Scriptures as the inspired word of God. The first, extending from the creation to the end of the apostolic age, includes the days before the flood, the times of the patriarchs, of the exodus from Egypt, and the conquest of Canaan, of the kings and prophets, the captivity, restoration, and sub-

jection to Roman rule; the mission of John the Baptist, the advent, life, and work of Christ, and the apostolic founding and extension of the church. At the close of the apostolic age, ecclesiastical history, in its more restricted range, begins. It may be assigned in three great divisions:

I. ANCIENT CHRISTIANITY, from the death of the apostle John to Charlemagne, A.D. 100-800.

1. *The age of persecution*; to the accession of Constantine, 100-325. The principal part of the "ten" persecutions; testimony of the martyrs, confessors, and argumentative defenders of Christianity; beginning of monasticism; rise and progress of the hierarchy; extension of Christianity throughout the empire and beyond its bounds.

2. *The imperial age*; Constantine to Gregory I., 325-590. Influence of Christian emperors within the church; complete establishment of the hierarchy; Arian and Pelagian controversies; fall of paganism; missionary work of Patrick and Columba in the British isles; five general councils, Nicæa, 1st Constantinople, Ephesus, Chalcedon, 2d Constantinople.

3. *The age of Christian nationality* in Europe; Gregory I. to Charlemagne, 590-800. Evangelical British missions in France and Germany; Britain reappears as England, "*Angli or angeli*;" rise of Mohammed; the Saracens overrun Asia, Africa, and Spain, but are defeated in the west by Charles Martel; controversy and commotion concerning image worship and image breaking; temporal power of the pope granted by Pepin and confirmed by Charlemagne; Charlemagne crowned emperor by the pope.

II. MEDIEVAL CHRISTIANITY, Charlemagne to Luther, 800-1517.

1. *Continued progress of Christianity*; Charlemagne to Hildebrand, 800-1049. Extension of the Latin church in the west and of the Greek in the north-east; progress of the papacy; rise of scholasticism.

2. *Supremacy of the papacy*; from Gregory VII. to Boniface VIII., 1073-1294. Contest between the pope and the emperor; celibacy of the clergy enjoined; the crusades; culmination of scholasticism; mysticism.

3. *Decline of the papacy*; Boniface VIII. to Luther, 1294-1517. The Scriptures forbidden to the laity; the inquisition founded; persecution of the Albigenses; transubstantiation and auricular confession established; reformatory councils of Pisa, Constance, and Basle; heralds of the reformation—Wycliffe in England, Huss in Bohemia, Wessel in Holland, Savonarola in Italy; capture of Constantinople; revival of letters; invention of printing; maritime adventure; discovery of America.

III. MODERN CHRISTIANITY; Luther to the present time, 1517-1880.

1. *Age of Protestant reform and papal reaction*; Luther to peace of Westphalia, 1517-1648. Protestant churches in Germany, France, Switzerland, England, Scotland, America; Puritans, Jesuits, Jansenists; massacre of St. Bartholomew; Protestants banished from Bohemia; thirty years' war; treaty of Westphalia promising religious toleration.

2. *Age of struggle for religious liberty*; peace of Westphalia to the French and English wars in America, 1648-1750. Flight of Huguenots from France; non-conformists driven from their livings in England; growth of Greek church in Russia; increase of Protestantism in American colonies.

3. *Age of revolution, conflict, and progress*; 1750-1880. American independence, with separation of church and state; French revolution from absolute monarchy through democracy and imperialism to a republic; general uprising of the people, and advance in civil and religious liberty; growth of the United States, war of the secession, abolition of slavery, revival of evangelical religion; conflict of Christianity with various forms of irreligion and secularism—English deism, French infidelity, German rationalism, materialism; free church of Scotland; disestablished churches in Ireland; growth of ritualism; papal infallibility declared; bible societies, steam navigation, railroads, telegraphs, journalism; improvement of common schools, colleges, technical schools; extension of Christianity over the world.—See CHURCH HISTORY.

The SOURCES of ecclesiastical history are, first, *the written*; comprising acts of councils, creeds, liturgies, hymns, church laws, papal bulls, and encyclical letters, writings of the fathers, schoolmen, reformers, and anti-reformers; second, *the monumental*, including crosses, crucifixes, pictures, vestments, furniture, coins, churches, chapels; some of this class are partly written, as inscriptions on walls, pictures, tablets, and tombs. He who is thoroughly familiar with the imagery of the catacombs will sympathize more fully with the heart of the early church, during the period of persecution, than he would be able to do after the profoundest study of books alone. The basilicas, modeled after the grand secular edifices of Greece and Rome, illustrate the external enthronement of Christianity; the Byzantine churches record the splendor of the imperial age; the Gothic cathedrals are trophies of mediæval glory; those of the renaissance are memorials of the attempt to make pagan culture live again in Christian times. The ecclesiastical historian, besides general intelligence, culture, and learning, should possess the critical and judicial faculty, that he may discriminate between conflicting testimonies, and may interpret correctly the witness which he accepts. He should have an insight into speculative thought, metaphysical distinctions and ethical ideas; should be acquainted with human nature, scientifically and practically; should be in sympathy with the spirit of Christ, as exhibited in the New Testament, and have, in his inmost

being, an experience of spiritual truth. His style, in addition to all other attainable good qualities, should present a brilliant panorama rather than a lifeless schedule; should acquire a majesty worthy of the movement of the divine idea through the ages which he unfolds; and should throb with human sympathy as he narrates the endless story of sorrow and joy, fear and hope, spiritual death, and spiritual life.

ECCLESIASTICAL LAW. See CANON LAW.

ECCLESIASTICAL TITLES ASSUMPTION ACT (14 and 15 Vict. c. 60). In 1850, a ferment of Protestant zeal was awakened in Great Britain by an edict issued by the court of Rome dividing that country into territorial bishoprics, under an archbishop of Westminster. The brief was immediately followed by a pastoral by the newly appointed archbishop (cardinal Wiseman) "given out of the Flaminian gate." At the commencement of the parliamentary session of 1851, the subject of "papal aggression," and of the measures to be adopted to counteract it, superseded all other topics of interest. It was in these circumstances that lord John Russell introduced the ecclesiastical titles bill. By the act 10 Geo. IV. c. 7, it had been provided that the right and title of archbishops to their respective provinces, of bishops to their sees, and of deans to their deaneries, as well in England as in Ireland, having been settled and established by law, any person other than the person thereto entitled who should assume or use the name, style, or title of archbishop of any province, bishop of any bishopric, or dean of any deanery, in England or Ireland, should for every such offense forfeit £100. By the Roman Catholic party it was alleged that this enactment struck only at the titles to existing provinces and dioceses, and that though the pope could not create an archbishop of Canterbury, nor could his nominee assume that title without violating the law, there was no prohibition against the creation of an archbishop of Westminster. To meet this allegation, and remove the doubt which existed, the ecclesiastical titles act was passed, its object being to prohibit the assumption of such titles "in respect of any places within the United Kingdom." The penalty of £100 for every contravention of the act is to be recovered in accordance with the provisions of the former act, or at the suit of any person in one of her majesty's superior courts of law, with the consent of the attorney-general in England, or of the lord advocate in Scotland. The third section saves the episcopal bishops in Scotland from the operation of the act, providing, however, that "nothing herein contained shall be taken to give any right to any such bishop to assume or use any name, style, or title which he is not now by law entitled to assume or use." The passing of the act allayed the fears of the country on the subject of papal aggression; and though its provisions were not very steadily complied with in Ireland, no prosecution under it took place.

The Roman Catholic party having always considered the penal clauses of this act as a grievance, an arrangement was made for the repeal of the act. This was accomplished by the act 34 and 35 Vict. c. 53, which, after declaring that "no ecclesiastical title of honor or dignity derived from any see, province, diocese, or deanery recognized by law, or from any city, town, place, or territory within this realm, can be validly created," and that no "pre-eminence or coercive power can be conferred otherwise than under the authority of her majesty," repeals the ecclesiastical titles assumption act (14 and 15 Vict. c. 60) as inexpedient. The result is, that while no prosecution can now take place for assuming such titles, their assumption is still treated by the law as an illegal act.

ECCLESIASTICAL YEAR. See YEAR; also DATE.

ECCLESIASTICUS, the title of an apocryphal work, called in the Septuagint *The Wisdom of Jesus, the Son of Sirach*. It obtained the title of E., not because the writer was a priest (for regarding his profession nothing is known), but because it was, in the opinion of the fathers, the chief of those apocryphal works which they designated *ecclesiastici libri* (i. e., books not inspired, but which might be read in church for the edification of the people), to distinguish them from the canonical scriptures of the Old Testament. E. was originally composed in Aramaic; and the original text was apparently extant in the time of Jerome, who states that he had seen the Hebrew, but it is now lost. The author calls himself Jesus, the son of Sirach of Jerusalem; but when he flourished is not known. His book was translated into Greek, with an introduction by his grandson, who is usually, but not correctly, supposed to have had the same name as his grandfather. The date of the translation has been fixed as low as 130 B.C., and as high as 230 B.C. The former is the more probable. The contents of the work are not systematically arranged, so that we can only guess at what may be called the method and purpose of the thinking. The view taken of the mercy of God as extending to all mankind, indicates that the Jewish notions were breaking up; but still there is little to show that any great spirituality was taking its place. Its tone resembles that of the book of Proverbs. Exhortations to cheerfulness are constant; medicine, agriculture, etc., are highly praised; life is regarded from an ethical rather than from a religious point of view, and consequently "wisdom" is represented as the source of human happiness. The style of the writer is at times noble, and even sublime; and, to use the language of Addison, "it would be regarded by our modern wits as one of the most shining tracts of morality that are extant, if it appeared under the name of Confucius or of any celebrated Grecian philosopher."

ECCLESIOLOGY, a word of recent use, is the name which has been given in our own country to the study of church architecture and decoration. Besides discriminating the various styles of ecclesiastical architecture, E. takes account of the ground-plan and dimensions of a church; of its orientation, or the deviation of its line from the true east; of its apse, or circular or polygonal east end; of its altar or communion table, whether fixed or movable, stone or wood; of its reredos, dossel, or altar-screen; of its piscina, or basin and drain for pouring away the water in which the chalice was rinsed, or the priest washed his hands; of the sedilia, or seats for the priest, deacon, and sub-deacon, during the celebration of the eucharist; of the aumbrye, or locker, for the preservation of the communion vessels and elements; of the "Easter sepulcher," or recess for the reception of the host from Good Friday till Easter day; of the altar-candlesticks; of the altar-steps; of the altar-rails; of the credence table, or shelf on which to place the communion elements before they were put upon the altar; of the "misereres," or elbowed stalls; of seats within and without the chancel walls; of the height of the chancel as compared with the nave; of the chancel arch; of the rood-screen, rood-staircase, rood-door, and rood-loft; of the piers or columns; of the triforium or blindstory; of the clerestory; of the windows; of the parvise-turret, or outside turret leading to the parvise; of the roof or groining; of the eagle-desks and lecturns; of the pulpit; of the hour-glass stand, by which the preacher was warned not to weary the patience of the flock; of the reading pew; of the benches, pews, and galleries; of the aisles; of the shrine, firtour, or reliquary; of the benatura, or holy-water stoup; of the corbels, with special reference to the head-dress figured on them; of the pavement; of the belfry; of the baptismal font, with its accessories, the baptistery, the steps, the kneeling-stone, the chrismatory, the cover, and the desk; of the tower, with its lantern, parapet, pinnacles, louvres, windows, buttresses, and bells; of the porch and doors, with their niches and seats; of the parvise, or priest's chamber above the porch; of the moldings; of the pinnacle crosses; of the gargoyles, or rain-spouts; of the church-yard or village cross; of the church-yard yew; of the lych-gate, or corpse-gate, where the corpse was met by the priest; of the crypt; of the confessional; of the hagioscope, or opening in the chancel arch through which the elevation of the host might be seen; of the lychnoscope, or low window in the side-wall of the chancel, the use of which is uncertain; of the chest for alms; of the table of the ten commandments; of the church-plate; of the faldstool, or litany stool; of the embroidered work; of the images of saints; of the church well; of the sepulchral monuments and brasses, with their inscriptions; of the chapels or sacristies; of the vestry; of the dedication crosses. E. has a literature of its own, represented by such works as the *Handbook of English Ecclesiology* (Lond. 1847) of the "Ecclesiological Society;" Walcott's *Sacred Archaeology*; Bourassé's *Dictionnaire d'Archéologie Sacrée*. Recently, E. has been applied to a study of the constitution of the church.

ECCLESTON, JAMES HOUSTON, D.D.; b. Kent co., Md., 1838; graduated at Princeton coll., 1856; practiced law for two years. He studied theology at the Philadelphia divinity school, and was ordained priest in the Prot. Epis. church, 1865. He was rector of churches in Philadelphia, and in Newark, N. J.; and afterward was stationed at Baltimore. He was elected bp. of Iowa, 1875, but, owing to some technical obstruction, he was not consecrated.

ECCLESTON, SAMUEL, 1801-51; b. Kent co., Md., was educated at St. Mary's coll., Baltimore, where he became a Rom. Cath. He entered the seminary attached to the coll., 1819; was ordained priest, 1825; appointed vice-pres. of St. Mary's coll., 1827, and pres., 1829. In 1834 he became abp. coadjutor of Baltimore, and in the same year, on the death of the abp., Dr. Whitfield, he succeeded to the archiepiscopate.

ÉCHELON (from the Fr. *échelle*, ladder) is such a formation or arrangement of troops that, if viewed from a height, they would present some analogy to the successive steps of a ladder or staircase. The several divisions of the force, although parallel, are no two on the same alignment. Each has its front clear of that in advance, so that, by marching directly forward, it can form line with it. There are two kinds of E., *direct* and *oblique*. *Direct* E. is adapted for attack and retreat; while *oblique* E. (oblique in reference to the original front of the line) is adapted for changing position, or for getting on the enemy's flank.

The word E. is also used in reference to nautical maneuvers. A fleet is sometimes said to be arranged *en échelon*; at which time it is compared by sir Howard Douglas to a body of infantry in a square, having its diagonal parallel with the front. In other words, it presents a wedge-form towards the enemy. Under this arrangement the bow-guns and broadsides of the several ships can mutually defend each other; the stronger parts of one ship defending the weaker parts of some other.

ÉCHEVIN, an officer in France of a rank existing from the days of Charlemagne to the revolution of 1789. His general functions were financial. In Paris, the *échevins* were assessors; and in some cases they had the authority of local magistrates.

ECHIDNA, a genus of quadrupeds peculiar to Australia, and belonging to the order *monotremata*. Two species have been described, differing in the scantiness and abundance of the hair, but it seems not improbable that they are mere states of the same species, perhaps depending on the seasons or on age. The E. is about the size of a

hedgehog, and, like that animal, is covered with spines; which, however, are much larger and stronger, and are placed among soft silky chestnut-colored hair. Its head is small, the muzzle much elongated and slender, terminating in a small mouth, which is destitute of teeth, but furnished with several rows of small spines upon the palate, directed backwards. The tongue is extensile, and is used, like that of ant-eaters, for catching ants, the ordinary food of the animal. The tail is very short. The legs are also very short, each foot furnished with five large broad claws, fit for digging and burrowing, the claws of the hind feet being concave, and directed backwards and outwards, so as to form very efficient shovels for throwing out the earth. The E. burrows with great rapidity, being possessed of strength perhaps greater in proportion to its size than that of any other quadruped. When it cannot more completely disappear under the earth, it inters itself so far as to present only its spiny back to an assailant. The E. is capable of very long abstinence, and confines itself to its burrow during droughts. In confinement, it may be fed on milk, hard-boiled eggs, etc. See illus., MARSUPIALIA, vol. IX.

ECHIMYD, *Echimy*s, a genus of rodent quadrupeds, in some of their characters agreeing with dormice, but differing from them in having the tail scaly, and the fur coarse, and mingled with flattened spines. They are all South American. Some of them are known as spiny rats. One species excavates long burrows in the ground.

ECHIN'ADES, islands in the Ionian sea, around the entrance to the gulf of Corinth. They were said to have been formed by drifts from the river Achelous. They are now called the Curzolari islands, and are of little importance. Homer says they were inhabited, but later authors report otherwise. There are at present a few small villages on them. The battle of Lepanto was fought off these islands, Oct. 7, 1571.

ECHINEIS. See REMORA.

ECHINIDÆ, a family of *echinodermata*, the species of which are popularly known as sea-urchins, sea-eggs, etc. They have the body covered with a calcareous crust or shell, of an extremely porous structure (and thus differing very widely from the shells of mollusks), in polygonal plates nicely adapted to each other, and increasing by additions to the edges of each plate, so that the shell may enlarge with the enlargement of the animal, whilst new plates are also added around the superior orifice. The shell is pierced with rows of holes for the ambulacra (q. v.), and is externally covered in a living state with a membrane—sometimes very delicate, sometimes thick and spongy—which communicates by many delicate processes with the interior, and unites the bases of all the spines. The spines differ very much in the different genera and species, in their length, strength, number, and arrangement; they are attached to tubercles on the surface of the shell, by cup-like bases capable of working upon the tubercles, in the manner of a ball-and-socket joint; and they are moved by means of the connecting membrane so as to be employed in locomotion. In some species, they seem to be the principal organs of locomotion; in others, the ambulacra are so. By means of the spines, some, in which they are few and strong, can walk even on dry ground; others, in which they are minute and very numerous, employ them in burying themselves in the sand. The mouth of the E. is situated at the lower orifice of the shell, and is generally furnished with five flat calcareous teeth, moved by a very complex apparatus of bony sockets and muscles—"a very powerful mill" for grinding down their food, which is supposed to consist of small crustaceans and mollusks. The intestine is long and spiral; the vent, in the E. of most regular form, is at the upper end of the shell, exactly opposite the mouth; in others, in which there is a departure from the characteristic orbicular form, it is more or less lateral. The E. abound in all seas, and seem to have abounded still more in former geological periods. "Of all the *radiata*, they are most perfectly preserved in a fossil state," and the knowledge of their habits and organization is necessary to the geologist, "in order to understand the relations and associations of the numerous species which abound in many of the earth's strata." See illus., INVERTEBRATES, vol. VIII.

ECHINOCOC'CUS. See TAPE-WORM.

ECHINODERMATA (Gr. *spiny-skinned*), a class of radiate animals, the highest in organization of that great division of the animal kingdom. They have a digestive and a vascular system; for the former, however, there is in many of them only a single orifice; a circular and radiating nervous system has been observed in many; they are especially characterized by their well-organized skin, which in many is strengthened by calcareous plates, and in some also has the additional protection of numerous long spines. *Echinidæ* (sea-urchins) exhibit these characteristics in greatest perfection. *Asteriade* (star-fishes), *ophiuridæ* (brittle-stars), *crinoidæ*, *holothuridæ* (sea-slugs, sea-cucumbers, etc.), and *sipunculidæ*, are also ranked among the E., and have been variously arranged in orders by different naturalists. Spines are wanting in most of them; in some (*holothuridæ* and *sipunculidæ*), there are not even calcareous plates, and there is no inconsiderable departure from the ordinary and perfect radiate form, an approach being made to the forms of mollusks and worms, whilst yet the accordance with the other E. is very perfect in other parts of the organization. Almost all the E. are free, moving about at the bottom of the sea; some of them—at least in an immature state—are stalked and fixed. They are provided with "an apparatus for water circulation," a peculiar charac-

teristic of radiate animals, and which "can scarcely be said to exist in any of the other types." By means of this it is that they fill and fit for use the suckers or *ambulacra* (q. v.) with which most of them are provided, but of which the *sipunculidae* are destitute. The spines as well as the ambulacra of the E. are used by those which possess them (*echinidae* and *ophiuridae*) as organs of locomotion.—The British E. are described by Dr. Edward Forbes in an interesting work, entitled *A History of British Star-fishes and other Animals of the Class Echinodermata* (Lond. 1841).

ECHINUS, of Vitruvius, is a classical molding in the form of a series of eggs, whence it is also called the ovolo or egg-molding. The eggs are sometimes divided by an anchor or dart. The type of this ornament is sometimes said to have been the chestnut and shell.

ECHINUS, a genus of the order *echinodermata*, known as sea-urchins, found along the American coast. The common echinus of the Atlantic coast is about an inch in diameter; but some kinds are three or four times as much. They have globe shaped cases, flat on the lower side, formed of calcareous plates, covered on the outside with movable spines from 1 to 5 in. long. With the aid of the spines and a great number of feet with suckers at the ends, the animal rolls slowly over the bottom, or clings to neighboring objects. They bore holes in the hardest rocks, where they make their homes, increasing the cavities as they grow, but not the opening, and so are often prisoners for life. Some species bury themselves in the sand near the water. In tropical climates some are used for food.

ECHIUM. See VIPER'S BUGLOSS.

ECHMIEDZIN'. See ETCHMIADZIN.

ECHO (Gr. *sound*). Sound is produced by waves or pulses of the air; when such a wave comes against a wall or other opposing surface, it is reflected like light, and proceeds in another direction, and the sound so heard is an echo. Even the surface of a cloud suffices to reflect sound, as may be observed during thunder and the discharge of cannon. That the echo of a sound may return to the point where the sound originated, the reflecting surface must be at right angles to a line drawn to it from that point. Oblique walls send the echoes of a person's voice off in another direction, so that they may be heard by others, though not by him. In order to echo words distinctly, the reflecting surface must on the whole be even, or so curved as to resemble a concave mirror. This last form is necessary for returning a distinct sound when the distance is considerable. A great degree of evenness, however, is not essential, as it is no uncommon thing for the edge of a wood to return an echo. The distance of the reflecting surface must also be such as to allow a sufficient time to elapse between the sound and the return of the echo for the ear to distinguish them; when they succeed too closely, they merge into one. An interval of about $\frac{1}{3}$ of a second is necessary to discriminate two successive sounds; so that if we assume 1125 ft. as the distance traversed by sound in a second, $\frac{1}{3}$ of 1125, or 62 ft., will be the least distance at which an echo can be heard, as the sound will go that distance and return in $\frac{1}{3}$ of a second. If the distance is less, the echo only clouds the original sound, but is not heard distinct. It is these indistinct echoes that interfere with hearing in churches and other large buildings (see ACOUSTICS); hence anything that breaks the evenness and continuity of the reflecting surfaces is an improvement in this respect. The number of syllables that any particular echo will repeat, depends upon how many can be uttered in the time that the sound takes to go and return from the reflecting surface. The echo at the tomb of Metella, in the Campagna, near Rome, of which Gassendi speaks as repeating a hexameter line requiring $2\frac{1}{2}$ seconds to utter it, must therefore come from a distance of about 1500 feet. Such echoes are rare, as the various conditions are seldom all fulfilled. When there happen to be several reflecting surfaces at different distances in the direction of the sound, with a sufficient interval between them, each gives a separate and distinct echo. A similar effect is produced when two surfaces are inclined to each other in such a way as to give repeated reflections of the sound from the one to the other like the mirrors of a kaleidoscope, thus multiplying echoes of echoes. To this multiple and repeating class belong the famous echoes of Killarney, and that produced between the wings of the castle of Simonetta, near Milan, which repeats the report of a pistol 60 times.

ECHO, in music, is the repetition of a melodic phrase, frequently written for the organ, on account of the facility with which it can be produced by the stops.

ECHO, in Grecian mythology, one of the Oreades, or mountain nymphs. The name denotes sound in the abstract. Echo could not speak until spoken to—a punishment inflicted upon her by Juno, who was detained by Echo's talkativeness while Juno was hunting among the Oreades for her truant Jupiter. A further legend is that Echo fell in love with Narcissus; but as he did not respond, she wasted away with grief until nothing but her voice remained; whereupon Nemesis punished the fickle Narcissus by causing him to fall in love with himself.

ECHO CAÑON, a deep ravine in Utah, near the Union Pacific railroad; 975 m. w. of Omaha. The sides are of rock, bare, and almost vertical in position. The scenery is remarkably beautiful and sublime.

ECHOLS, a co. in s. Georgia, bordering on Florida, intersected by a branch of the Plant System railroad, and the Allapaha river; 390 sq. m.; pop. '90, 3079, includ. colored. The surface is level and the soil sandy. Productions, corn, cotton, etc. Co. seat, Statenville.

E'CIJA, a city of Spain, Andalusia, in the province of Seville, and 45 m. e.n.e. of the town of that name, is situated on the left bank of the Jenil, in lat. 37° 33' n., long. 5° 8' w. It is surrounded by gardens, and stands in the center of a district fertile in corn and oil. E. is a well-built and prosperous town. On account of the heat of the climate, this town is called by the Spaniards the oven of Andalusia. E. has many pleasant alamedas (public promenades), shaded by trees, and adorned with statues and fountains; the principal promenade is that which stretches along the banks of the river. Pop. '87, 23,615. E. was called in ancient times *Astigis*, and was one of the chief cities of the Roman province of Hispania Bœtica; its origin is unknown. It is said to have been visited by the apostle Paul, a gilt statue of whom may be seen in the city. E. was called *Colonia Augusta Firma* by the Romans, and abounds in Roman antiquities. It also presents several specimens of Moorish architecture in the shape of gates and massive towers.

ECK, JOHANN MAYR VON, the well-known adversary of Luther, was b. in 1486 at Eck, a village in Suabia, where his father, Michael Mayr, was a peasant, and afterwards a bailiff. Endowed with considerable ability, young E. commenced at an early period the study of the church fathers and the scholastics, and acquired a great skill in theological disputation. In 1518, when his *Obelisci* appeared in opposition to Luther's *Theses*, he was doctor of theology, canon of Eichstädt, and pro-chancellor of the university of Ingolstadt. The publication of his *Obelisci* involved him in a disputation with Karlstadt, which lasted from the 27th June to the 16th July, 1519. The only effect of the disputation on the people was to make them wonder at E.'s volubility; but having impugned some of Luther's views in the course of his disputation, he was assailed by the great reformer, and by Melanchthon. E. nicknamed his opponents *Lutherans*, and instigated partly by personal hatred, and partly by Fugger (q.v.), went to Rome in 1520, to induce the pope to take strong measures against Luther. He returned with a papal bull of condemnation in his pocket, but the people in many places stood by Luther; and at Leipsic, in particular, E. was so roughly received, that he had to take refuge in the monastery of St. Paul's. Later we find him at the Augsburg diet of 1530, where he let slip out the memorable statement, that "with the church fathers, he would venture to oppose the Augsburg confession, but not with the Scriptures." In the religious convocations held at Worms in 1540, and at Ratisbon in 1541, he also took part. He died in 1543. A desire to shine and to play an important part in the affairs of men, coupled with a strong love of lucre, were the leading features of his character. Though an extremely learned ecclesiastic, he had no great talent, but was loud, boisterous, and full of assurance. See *Life*, by Wiedmann (Regensburg) (1865).

ECKERMANN, JOHANN PETER, well known to the literary world through his intercourse with Goethe, was b. in 1792, at Winsen on the Lube, in Hanover, studied, 1821-23, at Göttingen, and afterwards went to Weimar, where he took part in the *rédaaction* of the last volume of Goethe's *Sämmtliche Werke*. At the same time, he commenced to contribute articles to the *Morgenblatt*, on art and antiquity. In 1827, the university of Jena conferred on him the degree of PH.D. Two years later, he was appointed to superintend the studies of the heir to the grand duchy of Weimar, in the German and English languages and literature. In 1830, he traveled with Goethe's son in Italy, and on the death of the patriarch of German literature, he edited his posthumous writings. During the years 1839-40, he edited a new edition of Goethe's *Sämmtliche Werke*, in 40 vols. But E. is most widely and favorably known by his *Gespräche mit Goethe* (Conversations with Goethe). The greater part of these *Gespräche* appeared at Leipsic in 1836, the remainder at Magdeburg in 1848. It cannot be said with truth that E. has done for Goethe what Boswell did for Johnson, because Goethe did not require this. Johnson's writings give us but a faint idea of the man; hence Boswell's *Life* looks like a revelation; whereas there was the most perfect harmony in Goethe between the man and the author. Still, E.'s book is of immense value, just because it shows us this harmony, giving us, as it does, a picture of Goethe in his manifold social and literary relations, and exhibiting to us the simple, natural, and noble principles on which he studied and wrote. The *Gespräche* have been translated into all European languages, even into Turkish. The best English translation is that by John Oxenford (Lond. 1850). E. died at Weimar, 3d Dec., 1854.

ECKFORD, HENRY, b. Scotland, 1775; d. Constantinople, 1832. He was one of the earliest of the famous shipbuilders of New York. In 1812, during the war with England, he built a fleet of vessels for service on the lakes. He was the builder of the *Robert Fulton*, which made the voyage by steam to Havana and New Orleans. In 1820, he was naval constructor at Brooklyn, and built six ships of the line. Afterwards he built many ships for foreign powers. In 1831, he built a man-of-war for Mahmoud, the sultan of Turkey, and visited that country to organize a navy-yard.

ECKHART, JOHANNES, generally called MEISTER (master) ECKHART, lived in the latter part of the 13th and beginning of the 14th c.; b. probably about 1260. He was

of the Dominican order, and for some time professor in a college in Paris. Boniface VIII. called him to Rome to assist in the controversy between the pope and Philip of France. In 1304 he was provincial of his order for Saxony, and in 1307, vicar-general of Bohemia. He was distinguished for practical reforms, and for his power as a preacher. He systematized and expounded the fundamental notions of the Beghards (see BÉGUINES) and Brethren of the Free Spirit. The opponents of the Beghards found some propositions in Eckhart's works for which he was called to account by the inquisition at Cologne. He made a conditional recantation, and appealed to the pope, by whom some of his propositions were formally condemned. About the time of the issuing of this condemnation, Eckhart died. His works show that he was deeply learned in all the philosophy of the time, and one of the profoundest thinkers of all time. His style is without system, brief, mystical, and full of symbolical expressions; but his thinking was clear, calm, and logical; and he gave the most complete exposition of what may be called Christian pantheism. The starting point of his doctrine is that, apart from God, there is no real being. But, in his view, God is the unknown. He conceives of the Godhead, as without any thing that can be affirmed concerning it. Any thing definitely ascribed to it would limit and therefore destroy its infinity. The Godhead is not God as known to us. From it proceeds the triune God, who is known. The *essence* of the Godhead is what it is in itself; its *nature* is that which it becomes as an object for others. It reveals itself in the personal God, the Father. The Son is the word or expression through and in which the Father becomes self-conscious. The Father eternally begets the Son, and the Son's return into the Father in love and mutual will is the Spirit. The Father is not before the Son; only through the begetting of the Son, only through arriving at self-consciousness, does he become the Father. The genesis of the Son from the Father involves also the production of the world of things; for God is reason, and in reason is contained the ideal world of creatures. In the Son all things are made in ideal form. As all things have arisen from God, so they all tend to return to him. Repose in him is the end of all things; and in man, the noblest of creatures, this end is realized. In him, specially, there is the power of reaching to the absolute, the ground both of God and the universe. This power—which E. called *the spark*—is in truth God working in man. In cognition of God, God and man are one; there is no distinction of knower and known. Union with God—the birth of the Son in the soul—is the ultimate end of activity and is to be attained by resigning all individuality. When this is reached the soul is one with God; its will is God's; it cannot sin. Yet all this applies only to the "spark" in the soul, the other powers of which may be properly employed about other things. Thus, the way is left open to adjust the balance between feeling and action; between philosophical theory and practical life. In Eckhart's theories appear at least the elements of some modern metaphysical speculations.

ECKHUNG' CHOO, a river of Thibet, is supposed to be the head stream of the Indus. It rises on the n. side of the Himalaya, near the sources of the Sutlej. The actual locality of its sources has been assigned to the Kailas mountains, in lat. 31° 25' n., and long. 81° 40' east. Flowing to the n.w., E. C. reaches long. 79° e. before it assumes the name of Indus.

ECK MÜHL, a village on the Laber, in Bavaria, notable for the battle fought there, on the 22d April, 1809, between 75,000 French and 40,000 Austrians. The archduke Charles had taken up his position on the right bank of the Danube, near Eckmühl. From this point, at the head of four divisions of the Austrian army, he threatened Napoleon, and hoped to gain possession of the road to Donauwörth, the occupation of which would have decided the fate of Bavaria. This was prevented by Davoust, who, moreover, by repeated attacks, contrived to keep the archduke in ignorance of Napoleon's designs. The plan of the latter was to cut off the Austrians from their whole remaining communications with the Iser and Inn, and by throwing them back upon Ratisbon and Bohemia, as their only line of retreat, to sever them entirely from the support and protection of Vienna. On the 22d, Napoleon suddenly appeared, with his army, opposite the village of Eckmühl. The action, on the side of the French, was commenced by Lannes, who drove back the Austrian left, while, at the same time, the village of E. was stormed by the Würtembergers. Shortly after, the high grounds between E. and Laichling, also occupied by the Austrians, were abandoned after a heroic struggle, and the archduke ordered a retreat on Ratisbon, which was admirably executed, though the defeated army was harassed by sixteen cavalry regiments. During the retreat, a magnificent and thrilling encounter took place at Eglofsheim between the French and Austrian cuirassiers, which, though it ended fatally for the latter, was largely instrumental in securing the retreat of the main body of the Austrian army. The Austrians had 5,000 men killed and wounded, and 7,000 taken prisoners, besides losing 12 standards and 16 pieces of cannon. The French loss was considerably less.

ECLAMP'SIA (Gr. *ek*, and *lambanō*—Ion. fut. *lampsomai*—I seize hold of), a somewhat pedantic and unnecessary technical term for convulsion (q.v.).

ECLECTICS, **ECLECTICISM**. Eclectics was the name given in ancient times to those philosophers who had no determinate system of their own, but who professed to choose (*eklegein*) from all systems the parts that they considered true. The systems from which the selections were originally made were those of Pythagoras, Plato, and Aristotle, but

ultimately eclecticism lapsed into an attempt to reconcile Platonism and Christianity. The chief representatives of this school were Plotinus and Proclus, who, however, did not so much make up a compound of doctrines gathered from without, as set up a view that endeavored to unite the results of previous systems into a consistent whole. Many of the early fathers of the Christian church who had been educated in the pagan schools of philosophy and rhetoric, and retained a fondness for their early studies, were E., such as Clemens Alexandrinus and Synesius of Cyrene. Modern eclecticism is conceived by some to have originated with Bacon and Descartes, but Hegel may be more properly considered its founder. In his *Philosophy of History* and other works, he endeavors, among other things, to point out the true and false tendencies of philosophic speculation in the various ages of the world; but it is to the lucid and brilliant eloquence of Victor Cousin (q.v.) that modern eclecticism owes its popularity. This system, if it can be so called, may best be defined as an effort to expound, in a critical and sympathetic spirit, the previous systems of philosophy. Its aim is to apprehend the speculative thinking of past ages in its historical development, and it is the opinion of some that such a method is the only one possible in our day in the region of metaphysics.

ECLECTIC SCHOOL OF MEDICINE. See AMERICAN ECLECTIC.

ECLIPSA REON, the name given by Ferguson, the astronomer, to a contrivance which he invented for exhibiting the time, quantity, duration, and progress of solar eclipses.

ECLIPSES. An eclipse is an obscuration of one of the heavenly bodies by the interposition of another, either between it and the spectator, or between it and the sun. The causes of E., as suggested in this definition, are so simple and familiar, that it is difficult for us to imagine how deeply E. affected men's minds before the dawn of astronomical science. To the ancients, they were without the order of nature—terrible presages of dire events; and at Rome, at one time, it was blasphemy, and punished by law, to talk publicly of their being due to natural causes. So strong a hold had this superstition on the popular mind, that even after it came to be generally believed that E. of the sun were caused by the moon coming betwixt us and that orb, E. of the moon were still referred to supernatural agency. When the moon was in eclipse, the people turned out and made a great noise with brazen instruments—the idea being, that by doing so they gave her ease in her affliction. According to some, Luna, when in eclipse, was in the pains of labor; according to others, she was suffering from the arts of wicked magicians. Similar notions have prevailed among all barbarian tribes. The Chinese, it is well known, imagine E. to be caused by great dragons trying to devour the sun and moon, and accordingly they beat drums and brass kettles to terrify the monsters into letting go their prey. Several stories are told of these popular superstitions being turned to good account by knowing persons; among which are those which represent Thales as bringing about peace between the Medes and Lydians; and Columbus, when in a great strait, procuring provisions from the natives of Jamaica through the prediction of eclipses.

Stars, planets, and the satellites of planets, may suffer eclipse. The principal E., however, are those of the sun and moon, called the solar and lunar eclipses. The transits of the lower planets over the face of the sun are partial solar E.; but solar E., properly so called, are those caused by the interposition of the moon between the sun and earth. Regarding solar E., it is observed that they happen always at the time of new moon, when the sun and moon are in conjunction, i.e., on the same side of the earth. In a partial eclipse, the sun's disk suddenly loses its circular form; it becomes indented on one side, the indentation slowly increasing for some time, and then diminishing until it disappears altogether. In a total eclipse, the indentation goes on increasing till the whole orb for a time disappears; after a short interval, the sun reappears again, passing through the same phases of obscuration in an inverse order. In an annular eclipse, the whole orb is obscured except a ring or annulus. Lunar E., again, it is observed, happen always at full moon, or when the sun and moon are in opposition, or on opposite sides of the earth, and are caused by the moon passing through the earth's shadow. Such E. are sometimes partial, and sometimes total, but never annular, and in their general phases they resemble those of the sun.

In speaking of E., we shall have occasion to use certain terms, which we shall now define. The *duration* of an eclipse is the time of its continuance, or the interval between immersion and emersion. *Immersion* or incidence of an eclipse is the moment when part of the luminary begins to be obscured; *emersion* or *expurgation* is the time when the luminary begins to reappear or emerge from the shadow. When the quantity of an eclipse is mentioned, the part of the luminary obscured is intended. To determine this part, it is usual to divide the diameter of the orb into twelve *digits*; and the eclipse is said to be of so many digits, according to the number of them contained in that part of the diameter which is obscured.

Having given this general explanation of the facts of observation on which the theory of E. turns, and of the language employed in speaking of them, we now proceed briefly to explain the theory itself, and how it is possible to predict the time of occurrence, and the duration and quantity of eclipses.

1. *Eclipses of the Moon.*—It has been said that these are caused by the moon passing through the earth's shadow. Before this explanation can be accepted, it must be shown that that shadow extends as far as the moon. This is easily done. Supposing

the earth to have no atmosphere, then the shadow is the cone marked in shade in fig. 1, whose apex is at O; and the question is, whether the distance OT from the apex to the earth's center exceeds the moon's average distance from the earth. Drawing TB, SA, from the centers of the earth and sun respectively, perpendicular to the line OBA, touching both spheres, and the line TC parallel to the line OBA, we have from the

similar triangles OTB, TSC, the proportion $OT : TB :: TS : SC$. Now, we know that TS, the (mean) distance of the sun, is equal to about 24,000 times TB; also, from the construction, $AC = TB$; and we know that $SA = 112$ times TB, whence it follows that $SC = 111$ times TB. The above proportion, then, gives $OT =$

216 times TB, since $\frac{24000}{111} = 216$ nearly. But the moon's average distance is only 60 times TB (the earth's radius). Hence it appears that the length of the earth's shadow is almost four times the average distance of the moon, and that the moon can enter it. Further, it is clear that, should it do so, it may be totally obscured; for it must enter at a point much nearer T than half the distance OT, which is 108 times TB; and everywhere within that distance it might be shown the breadth of the shadow is much greater than the moon's disk. But one consideration now remains to be stated to complete the proof of the theory of lunar eclipses. It was mentioned that they only occur at full moon, and we know that to be the only time when the earth is between the sun and moon, and so has a chance of throwing her shadow upon it. Why they do not occur every full moon, will be explained in treating of the prediction of eclipses.

In the foregoing explanation, we proceeded on the assumption that the earth has no atmosphere. If the assumption were correct, the earth's shadow would be darker and narrower than it is, and the phenomena of E. shorter in duration, but more striking. The effect of the atmospheric refraction (see REFRACTION) is to bend the rays which are incident on the atmosphere in towards the axis of the cone of the earth's shadow, those which pass through the lowest strata of the air being most refracted, and converging to a point in the line OT (see fig. 1), at a distance equal 42 radii of the earth from the earth's center. Accordingly, the moon, which, as we have seen, crosses the shadow at a distance of about 60 radii, never enters that part of it which is completely dark; thus, she never loses her light entirely, but appears of a distinct reddish color resembling tarnished copper—an appearance caused by the atmospheric refraction, in the same way as the ruddy color of the clouds at sunset. There is another reason why the phenomena of a lunar eclipse are less striking than, from the explanation given relative to fig. 1, might be expected. Every shadow

cast by the sun's rays necessarily has a penumbra, or envelope, on both sides of the half-shadow. In the case before us (fig. 2), suppose a cone having its apex O' between the sun and earth, and enveloping each of them respectively in its opposite halves, CO'C' and AO'A' (fig. 2). It is clear that from every point in the shaded part of the cone CO'C', and without the shadow BOB', a portion of the sun will be visible—and a portion only—the portion increasing as the point approaches either of the lines CB, C'B; and diminishing as it approaches the lines BO, B'O. In other words, the illumination from the sun's rays is only partial within the space referred to, and diminishes from its extreme boundary lines towards the lines BO, B'O. When, then, the moon is about to suffer eclipse, it first loses brightness on entering this penumbra; so that, when it enters the real shadow, the contrast is not between one part of it in shade and the other in full brilliancy, but between a part in shade and a part in partial shade. On its emersion, the same contrast is presented between the part in the umbra and the part in the penumbra. What we should expect on this geometric view of the earth's shadow, actually happens. From the breadth of the penumbra, it happens that the moon may fall wholly within it before immersion in the umbra commences; and so softly do the degrees of light shade into one another, that it is impossible to tell when any remarkable point on the moon's surface leaves the penumbra to pass into the umbra, or the reverse.

2. *Prediction of Lunar Eclipses.*—We said that lunar E. only happen at full moon. They do not happen every full moon, because the moon's orbit is inclined to the ecliptic, on which the center of the earth's shadow moves at an angle of $5^{\circ} 9'$ nearly. Of course, if the moon moved on the ecliptic, there would be an eclipse every full moon; but from the magnitude of the angle of inclination of her orbit to the ecliptic, an eclipse can only occur on a full moon happening when the moon is at or near one of her nodes, or the points where her orbit intersects the ecliptic. An eclipse clearly can happen only when the centers of the circle of the earth's shadow and of the moon's disk approach within a distance less than the sum of their apparent semi-diameters; and this sum is very small; so that except when near the nodes, the moon, on whichever side of the ecliptic she may be, may pass above or below the shadow without enter-

Fig. 1.

FIG. 2.

ing it in the least. The moon's average diameter is known to be $31' 25'' .7$, and from the *Nautical Almanac* we may ascertain its exact amount for any hour—its variations all taking place between the values $29' 22''$ and $33' 28''$. As for the diameter of the circle of the shadow, it is easily found by geometric construction and calculation, and is shown to vary between $1^\circ 15' 32''$ and $1^\circ 31' 36''$; and its value for any time may be found from the *Nautical Almanac*, to which value astronomers usually add $1'$ as a correction for its calculation proceeding on the assumption that the earth has no atmosphere. Starting from these elements, it is a simple problem in spherical trigonometry—which may be solved approximately by plane trigonometry by supposing the moon and the earth's shadow to move for a short time near the node in straight lines—to fix the limits within which the shadow and moon must concur to allow of an eclipse. Recollecting that the earth's shadow on the ecliptic is at the opposite end of the diameter from the sun, and that therefore as it nears one node the sun must approach the other—the sun and shadow being always equidistant from the opposite nodes—we find, from the solution of the above problem: 1. That if, at the time of full moon, the distance of the sun's center from the nearest node be greater than $12^\circ 3'$, there cannot be an eclipse. 2. If at that time the distance of the sun's center from the nearest node be less than $9^\circ 31'$, there will certainly be an eclipse. 3. If the distance of the sun's center from a node be between these values, it is doubtful whether there will be an eclipse, and a detailed calculation must be resorted to, to ascertain whether there will be one or not. Into the nature of that calculation we shall not attempt here to enter; suffice it to say that, knowing from the *Nautical Almanac* the true time of the sun and moon being in opposition, the true distance of the moon from the node at the time of mean opposition, with the true place of the sun at that time, as well as the moon's latitude, we may, by means of these elements, combined with the obliquity of the moon's path and her motion relative to that of the sun, not only fix whether there shall be an eclipse or not, but predict its exact magnitude, duration, and phases. It may here be mentioned, that before the laws of the solar and lunar motions were discovered with anything like accuracy, the ancients were able to predict lunar E. with tolerable correctness by means of the lunar cycle (see PERIOD) of 18 Julian years and 11 days. Their power of doing so turned on this, that in 223 lunations the moon returns *almost exactly* to the same position in the heavens. If she did return to *exactly* the same position, then, by simply observing the E. which occurred during the 223 lunations, we should know the order in which they would recur in all time coming.

All lunar E. are universal or visible in all parts of the earth which have the moon above their horizon, and are everywhere of the same magnitude, with the same beginning and end; and this universality of lunar E. is the reason why it is popularly thought, contrary to the fact, that they are of more frequent occurrence than solar eclipses. The eastern side of the moon, or left-hand side as we look towards her from the north, is that which first immerses and emerges again. The reason of this is, that the proper motion of the moon is swifter than that of the earth's shadow, so that she overtakes it with her east side foremost, passes through it, and leaves it behind to the west. It will be readily understood, from the explanations above given, that total E. and those of the longest duration happen in the very nodes of the ecliptic. But from the circumstance of the circle of the shadow being much greater than the moon's disk, total E. may happen within a small distance of the nodes, in which cases, however, their duration is the less. The further the moon is from her node at the time, the more partial the eclipse is, till, in the limiting case, she just touches the shadow, and passes on unobscured.

3. *Eclipses of the sun*, so called, are caused, as we have stated, by the interposition of the moon between the earth and sun, through which a greater or less portion of the sun is necessarily hid from view. In one sense, a solar eclipse might more properly be called an eclipse of the earth, caused by the moon's shadow falling upon it.

By a process similar to that used in ascertaining the length of the earth's shadow, it can be shown that the greatest value of the length of the moon's shadow is 59.73 semi-diameters of the earth; at the same time, we know that the least distance of the moon from the earth is about 55.95 semi-diameters. It follows that when a conjunction of the sun and moon happens at a time when the length of the shadow and the distance of the moon from the earth are, or are nearly, equal to the values above stated, the moon's shadow extends to the earth and beyond it. Should the shadow in these circumstances fall upon the earth, there will be a total eclipse of the sun at all places within it or over which it moves (fig. 3). If L be the moon, T the earth, and abL the moon's shadow cast by the sun, there will be a total eclipse of the sun at every point that is completely within the portion ab of the earth's surface. Again, the smallest value of the length of the moon's shadow may be shown to be 57.76 semi-diameters of the earth, and the greatest distance of the moon from the earth is 63.82 semi-diameters. Suppose the moon interposed between the earth and sun when these values concur, it is clear that the moon's shadow will fall short of the earth. In this case, the sun cannot be altogether hid from any point of the earth's sur-

FIG. 3.

face; but this case, or one approximate to it, is that in which there will occur an annular eclipse. In the figure, suppose O to be the apex of the shadow which falls short of the earth, and conceive the cone of the shadow produced earthwards beyond O into a second cone *Ocd*; then from every point within the section *cd* of the earth's surface, the moon will be seen projected as a black disk on the middle of the disk of the sun, the portion unobscured forming a ring or annulus of light. While in the two cases just described

FIG. 4.

the eclipse is total or annular at places within *ab* or *cd*, it will be partial at other places; the moon will appear projected against a portion of the sun's disk, making a circular indentation. To ascertain the places at which the eclipse will be partial, we have merely to form the cone of the

penumbra of the moon's shadow in the manner explained in treating of lunar E.: at all places on the earth's surface within that cone there will be a partial eclipse. A simple calculation shows what is the observed fact, that the cone of the penumbra is not nearly large enough to embrace the whole of the face of the earth directed to the sun; in other words, solar E. are not universal, like those of the moon, i.e., they are not seen from all places that have the sun above their horizon at the time of the eclipse, which is the reason that though they are of more frequent occurrence than lunar eclipses, the latter are commonly supposed to occur more frequently.

If one could take up a position in space from which he could command a view of the whole face of the earth turned to the sun during a lunar eclipse, the phenomena which he would observe would be somewhat as follows. Marking the point of the earth first touched by the penumbra of the moon's shadow, he would observe the obscuration spreading therefrom over a wide and wider area as the penumbra advanced, till at last, supposing him to be viewing the case of a total eclipse, there appeared the umbral cone marking the earth with a dark spot. By and by, the whole penumbral shadow would be on the earth. The black spot would then appear to travel onwards with the motion of the shadow, and in its center, in a course determined by the composition of the proper motion of the shadow or moon, and the motion of rotation of the earth. Part of the globe would be free from the affection, and, in the course of time, the umbral spot would progress over different portions of the earth in succession, till at last it passed off the earth's surface, drawing after it the penumbral shadow. Could the spectator mark on the globe the various places affected by the shadow, with their degrees of shading, he would have a perfect chart of the course of the eclipse. The small belt of the globe traversed by the umbra would mark all places at which the eclipse would be total, while the degrees of shading over places adjoining that belt on both sides would indicate the magnitude of the partial eclipse as seen from them. The breadth of the belt traversed by the umbra, when the sun's distance is greatest and the moon's least, is estimated at about 180 m.; and in the same case the penumbra is estimated to cover a circular space of 4,900 m. in diameter, the eclipse happening exactly at the node. If the eclipse does not happen at the node, it is clear that the axis of the shadow must be inclined to the plane of the ecliptic, that the shadow will be cut obliquely, and therefore that the part of the earth in shade will be oval. It may here be stated that astronomers usually calculate beforehand the motion of the shadow over the earth's surface, and prepare charts to exhibit its motion. Such a chart an observer from a position outside the earth would have it in his power to make from observation.

Of the commoner phenomena attending an eclipse of the sun, as regards the appearance of that luminary, nothing need be said; they are perfectly analogous to those of lunar E., except in the case of the eclipse being annular. There are other appearances, however, attending an eclipse of the sun, especially when it is total, that are very remarkable. The most instantaneous darkening of the orb of day, more particularly when it is unlooked for, is calculated to impress a spectator with vague terror; even when expected, it fills the mind with awe, as a demonstration of the forces and motions of the mechanism of the universe. The sudden darkness, too, is impressive from its strangeness as much as from occurring by day; it resembles neither the darkness of night nor the gloom of twilight. The cone of the moon's shadow, though it completely envelops the spectator, does not, as we have explained, inclose the whole atmosphere above his horizon. The mass of uninclosed air accordingly catches the sunlight, and reflects it into the region of the total eclipse, making there a peculiar twilight. Stars and planets appear, and all animals are dismayed by the dismal aspect of nature.—See Mahoud-Bey's report of the total eclipse of July, 1860. Mr. Warren De la Rue, who was one of an expedition of scientific men who went to Spain to witness the same eclipse, gives the following account of the aspects of nature near the time of totality: "When the sun was reduced to a small crescent, the shadows of all objects were depicted with great sharpness and blackness, reminding one of the effects of illumination with the electric light. The sky at this period assumed an indigo tint, and the landscape was tinged with a bronze hue."—*Athenæum*, 1860, vol. ii., page 259. At totality, there was still light enough to enable the observer to draw without the aid of his lamp, while the sky near the sun presented a deep indigo, and thence passed through a sepia tint to red and brilliant orange near the horizon. It must be said, however, that the strange appearance

here recorded is exceptional, and probably not such as could ever occur in our latitude. There is one set of phenomena attending total E. of the sun, which are at once strange and invariable, and the causes of which cannot be said to be yet fully understood. As long as the total eclipse lasts, there appears round the sun and moon a luminous corona, while at its base, and projecting beyond the dark edge of the moon, appear very brilliant prominences, generally of a red color. These prominences were first observed during the total eclipse of 8th July, 1842; but they are found to be constant attendants on E., and methods have been invented of rendering them visible at any time without the interposition of the moon. The spectroscope reveals them to consist mainly of hydrogen gas in an incandescent state, and a comparatively narrow belt of the same color and substance runs round the whole circumference of the sun. The prominences are sometimes seen to shoot up like flames, in wild fantastic shapes, with incredible velocity, and to the height of tens of thousands of miles.

In the eclipse of 1860 the light of the corona was a silvery white, and it extended beyond the moon's limb about eight tenths of her diameter. The corona consisted first of a bright ring of about 2' wide, and then an exterior and fainter ring of about 3', beyond which, for a mean distance of about 2', extended a glory of small rays—the whole corona extending to 7' beyond the moon's limb. From the corona, at intervals, projected individual rays of remarkable size, and five in number: one of 9' length; another of 14', and shaped like the point of a star; a third, sabre-shaped, and extending 28'; a fourth, 28'; and a fifth, 10'. These individual rays are very differently described by different observers of the same eclipse, and are not well accounted for. The diffused light of the corona is believed to be caused by an immense extension of the gases forming the red envelope, only in a cooler and rarer condition.

4. *Prediction of Solar Eclipses.*—The period of 18 Julian years 11 days, referred to in treating of the prediction of lunar E., applies equally to solar E. with lunar; but the ancients, who understood that fact, could find no law of recurrence of solar E. within that period, so as to predict them. The reason of the failure is obvious; for though solar E. recur in a fixed order within the cycle, they are not visible at the same places on their recurrence as when first observed. By modern methods, however, E. of the sun may be predicted, with all their circumstances of time and places of observation, with the most perfect certainty. We shall not, however, attempt to explain what these methods are; suffice it that they resemble those already generally described as applied in the case of lunar E. At the time of a solar eclipse, the sun and moon are in conjunction; they are also in or near the same node; and no eclipse can happen if they are further than 17° from the node, or if the latitude of the moon, viewed from the earth, exceeds the sum of the apparent semi-diameters of the sun and moon. When within these limits, it is a problem of numbers and of spherical trigonometry to ascertain the nature of the eclipse, if any, which will happen.

The number of eclipses of the sun and moon together in a year cannot be less than two, or more than seven; the most usual number is four, and it is rare to have more than six. The explanation of the limitation of the number of E. is connected with the fact, that the sun passes by both nodes but once in a year, except in the case of his passing one early in the year, in which case, owing to the recession of the moon's nodes, he will again pass it a little before the end of the year. From the smallness of the cone of the moon's shadow, total solar E. are extremely unfrequent in any one place, compared with the frequency of their actual occurrence. At Paris there was only one total eclipse of the sun in the 18th c., that of 1724, and there will not be another till near the close of the 19th century. In London, not one total eclipse was witnessed during the 575 years, 1140–1715. See *illus., SOLAR SYSTEM*, vol. XIV.

ECLIPSES OF THE SATELLITES. See SATELLITES.

ECLIP TIC is the name given to the great circle of the heavens round which the sun seems to travel from w. to e., in the course of a year. It took its name from the early observed fact, that *eclipses* happen only when both bodies are in or near this path. A little attention about sunset or sunrise shows that the sun is constantly altering his position among the stars visible near him, leaving them every day a little further to the w.; and that this motion is not exactly e. and w., or parallel to the equator, becomes also evident by observing that the sun's height at mid-day is constantly altering. It is further observed that, twice a year, about Mar. 21 and Sept. 23, the sun is exactly on the equator. The two points of the equator on which the sun then stands are the equinoctial points, and are the intersections of the equator and ecliptic. Again, there are two days in the year on which the sun reaches his greatest and his least mid-day elevation: the first is the 21st of June; the second, the 21st of December. On these days, the sun has reached his greatest distance from the equator either way, and the points in his course where he thus seems to pause or halt in his retreat from the equator are called the solstices (*solis stationes*). These four points are distant from one another by a quadrant of the circle, or 90°. Each quadrant is divided into three arcs of 30°, and thus the whole ecliptic is divided into 12 arcs of that length, called signs of the zodiac (q.v.). These arcs or signs have been named after constellations through which the ecliptic passes. As the equinoctial points are not fixed, but recede yearly westwards about 50 seconds, and in a century about 1° 23', the same constellations and signs that coincided

when the division of the ecliptic took place, no longer coincide. The constellation of the ram, for instance, which originally stood in the first arc or sign, now stands in the second, every constellation having advanced forward 30° , or a whole sign. Modern astronomers therefore pay little attention to these constellations and signs, but count longitudes from the existing spring equinoctial point from 0° to 360° .

Not only do the points change where the ecliptic and equator cross each other, but the angle of their inclination, called the obliquity of the ecliptic, is also variable. It is at present nearly $23\frac{1}{2}^\circ$, and is diminishing at the rate of about 50 seconds in a century. Were it to go on diminishing always, the ecliptic and the equator would at last coincide, and the earth would then have an everlasting spring. The decrease, however, has a limit; the obliquity oscillates between two definite bounds, which it can never pass. It has been calculated that it was at its greatest 2,000 B.C., and was then nearly $23^\circ 53'$. Since then, it has been decreasing, and will continue to do so till about the year 6,600 A.D., when it will be at its least, and about $22^\circ 54'$. These slight alterations cannot sensibly affect the seasons.

The physical cause of this change of the obliquity is the action of the other planets, especially Jupiter, Mars, and Venus, on the mass of the earth. The fact of the change was known to astronomers in very ancient times; Herodotus mentions an old tradition of the Egyptians, that the ecliptic had formerly been perpendicular to the equator—a notion into which they were most probably led by observing, for a long series of years, that its obliquity was constantly diminishing. There can be little doubt that the Chaldeans arrived at the epoch of 403,000 years before the entry of Alexander into Babylon, to which they proudly referred for their first astronomical observations, by computing the time when the ecliptic was perpendicular to the equator, on the supposition of its obliquity diminishing $1'$ in 100 years. Though it was not till after the discovery of the law of gravitation that the change on the obliquity could be explained, yet that it was changing was believed in by many astronomers, although some doubted whether the differences in the values at different times were not due to errors of observation. The earliest known measure of the obliquity of the ecliptic was made by Tcheou Kong, the regent of China. Among the western nations, the earliest measurements were made by Pytheas and by Eratosthenes.

ECLOGUE, usually designates a pastoral poem in which are related the loves and adventures of shepherds and shepherdesses in some ideal scene and period. The name is sometimes applied to Virgil's *Bucolics*. Spenser is perhaps the leading English poet in eclogues—a species of composition now out of date.

ÉCOLE POLYTECHNIQUE is one of the most celebrated military academies in France. In 1793, all the public establishments in Paris were in a convulsed state, owing to the revolution. In 1794, M. Lamblardie, director of the *Ponts et Chaussées*, proposed the establishment of an *École Centrale des Travaux Publics*, to educate young men for military, naval, and civil engineering. Monge and Carnot favoring his plan, it was carried out, and a school established at the palais Bourbon. The first list of professors comprised names which afterwards acquired European celebrity—including those of Lagrange, Prony, Monge, Hachette, Hassenfratz, Fourcroy, Vauquelin, Berthollet, Chaptal, Pelletier, Guyton-Morveau, and Merimée. In 1795, the name was changed to E. P.; many alterations were made in the organization; artillery studies were included in the course; and the pupils were ordered to wear a uniform. When Napoleon went to Egypt, 40 pupils from the E. P. accompanied him, many of whom greatly distinguished themselves. Napoleon made the organization of the school more strictly military in 1804, to identify it more fully with the army. The school was dissolved in 1816, again in 1830, and again in 1832, on account of the impetuous way in which the pupils mixed themselves up with the political disturbances of those years; but as the school suited the military genius of the French nation, it was re-established on each occasion, after the restoration of tranquillity. Candidates can be admitted only by competitive examinations, which take place yearly. A proclamation from the war office, made public before the 1st of April, informs intending competitors of the subjects on which they are to be examined, and the time when the examinations begin. To be eligible as a candidate, the youth must be French, and must be more than sixteen, and less than twenty years of age before the 1st of Jan. following; but soldiers are admissible up to the age of twenty-five, provided they can give proof of two years of service in the regular army. The cost of board alone is 1000 francs (nearly £42) a year. A complete course of instruction lasts for two years; when the pupils who have satisfactorily passed the final examinations have the privilege of choosing, from among the various public services supplied from this school, the particular branch they wish to enter, such as artillery, engineers, the staff, the department of telegraphs, or some of the other government monopolies. The school was reorganized by a decree of the 15th April, 1873.

ECONOMY, a socialist town and borough, in Beaver co., Pa., on the right bank of the Ohio, about 17 m. below Pittsburg. The settlement was planted in 1825 by immigrants from Germany. The inhabitants own everything in common—3,500 acres of land, upwards of 100 houses, a church, a school, a museum, and manufactories of wool, cotton, and silk. Pop. '90, town 1029, borough 413. See HARMONISTS.

ECONOMY, POLITICAL. See POLITICAL ECONOMY.

ÉCORCHÉ. A figure in which the muscles are represented, stripped of the skin, for purposes of artistic study, is called by the French an *E.*, and from them we have borrowed the term. From a portion of the figure the upper muscles are also removed, so as to exhibit those which lie nearer to the bone. It is not uncommon to represent the *E.* in action, in the form of the fighting gladiator. The first person who did so was Salvage, a French artist and anatomist. To render the studies of pupils more complete, Salvage had this figure engraved in all the points of view, and more or less denuded of flesh, till at last it was little more than a skeleton, the only muscles represented being those which immediately cover the bones. Figures of this kind can now be procured both in plaster and papier-mâché.

ECOSSAISE, a dance of Scottish origin. It was written in 3-2 or 2-4 time, and played upon the bag-pipes. The modern ecossaise is a species of contredanse. See **COUNTRY DANCE**. Schubert wrote several ecossaises for the pianoforte.

ÉCOUTES (Fr. *écouter*, to listen), in military operations connected with siege-works, are listening-places. They are small galleries, excavated at regular distances, and going out beneath and beyond the glacis, towards the lines and batteries of the besiegers. Their purpose is, to enable the garrison to hear and estimate the works being carried on by the sappers and miners of the enemy.

ECRASEUR, the name of a long steel instrument, invented some years ago by a distinguished French surgeon, M. Chassaignac, and consisting of a fine chain, which, passed round any structure—as the base of a tumor, for example—gradually constricts it, and finally crushes its way through it by means of a screw or rack for tightening it, which is worked at the end of the handle. The advantage of this instrument over the knife is, that it causes little or no bleeding, the torn vessels spontaneously contracting and closing. It is specially applicable to cases of cancer of the tongue, piles, polypi, and various kinds of tumors. When a solid mass—as, for example, a considerable portion of the side of the tongue—is to be removed, the chain is sometimes pressed through the center, and made to cut two lines successively in the form of a V, in which the diseased structure is included. As the pain which is caused by this instrument is very great, the patient should be placed completely under the action of chloroform.

ÉCRASITE. See **EXPLOSIVES OF HIGH POWER**.

ECSTASY (Gr. *ekstasis*, a transposition, a change of situation or condition; applied to the mind in the sense of a state in which it is altered or fundamentally changed in character by some absorbing emotion), a word applied to those states of mind, which, without amounting to insanity (q.v.), in respect of the temporary character of the affection, are marked by mental alienation, and altered or diminished consciousness. A person in ecstasy may be violently moved, or completely passive; convulsed, or rigid, or flaccid in all the limbs; silent, or uttering unmeaning or excited language, or assuming the character of a prophet or inspired person; having, or not having intelligence of what is going on around him. The varieties are infinite, because this morbid state of the mind is nothing more in reality than the fixing of it in a particular attitude, as it were, in connection with an overmastering idea, emotion, or sensation, which causes all other external phenomena to be disregarded. Perhaps the most common form, or, at all events, that which is best known, is religious ecstasy closely allied to monomania and religious delusion of every kind; often simulated, but also occurring as a real disease, as in the case of those “struck” in revival meetings, and in the older histories of the conversions of Cambuslang, the *convulsionnaires* of St. Médard, and the epidemics of religious excitement mentioned under dancing mania (q.v.). It is also common to speak of the ecstasy of terror, and the expression is correct in exaggerated cases, where fear completely paralyzes both the consciousness and the power of motion and expression; so also there is an ecstasy of joy, of love of hate, of meditation; and in some physical states as catalepsy (q.v.), hysteria (q.v.), mesmerism (q.v.), a true ecstasy is one of the phenomena, inasmuch as the proper consciousness of the individual is temporarily abolished, or so much changed in character as to lead almost to the loss of the sense of personal identity. Some of the cases of presumed double consciousness (q.v.) are no doubt of this kind; and generally the same may be said of the state of the mind in many dreams and visions, and also in somnambulism (q.v.). A striking picture of this form of ecstasy is the well-known sleep-walking scene in *Macbeth*, where the lady’s mind is so completely preoccupied with the supposed blood stain on her hands, that though her eyes are open, we are told that “their sense is shut,” and the mind is also excluded from all the ordinary avenues of communication.

ECTHYMA is a pustular disease of the skin, in which the pustules often reach the size of a pea, and have a red, slightly elevated, hardish base. In the course of two or three days after the appearance of the pustule, it is replaced by a scab, which adheres firmly to the base, and is somewhat concave. On its removal, a deep red mark, a new scab, an ulcer, or a healed scar remains. The disease may be acute or chronic. The acute form is ushered in by slight constitutional, not amounting to febrile, symptoms, and by a burning or pricking pain at the seat of the eruption, which is usually confined to the neck and shoulders. The disease runs its course in 10 days or a fortnight. In chronic ecthyma, the pustules which follow in crops (often for several months) are

usually scattered over the extremities. This form of eruption indicates a low state of the system. It sometimes follows the acute disease, and not unfrequently is a tertiary symptom of syphilis. Pustules, which in no respect seem to differ from those of ecthyma, are produced by various local irritants. Thus the affection of the hands, popularly known as the *grocer's itch*, is produced by the irritation of brown sugar, perhaps by the *acari* which are so often present in it. Stone-masons are said occasionally to suffer from a similar disease. With regard to *treatment*, the acute form would in most cases doubtless disappear in the course of a fortnight, if left entirely to itself; but as the bowels are usually disordered, an occasional alterative aperient, as a few grains of gray powder with a little rhubarb, may be prescribed, and tepid water applied locally gives great relief. The patient should, moreover, be kept on a moderately good, nutritious diet. In the chronic form of the affection, a meat diet and the use of wine or porter are essential; while tonics, such as a combination of bark and nitric acid, are called for. Tepid baths are often useful, and if there is sleeplessness, an opiate should be taken at or shortly before bedtime.

ECTOZO'A (Gr. *ektos*, without, and *zoos*, living), a term which has been introduced, as in contradistinction to *Entozoa*, to designate those parasitic animals which live upon the external parts of other animals, as lice, ticks, etc. Such also are many of the entomostracous crustaceans, parasitic upon fishes. It is a question of much importance, not yet satisfactorily answered, if any of these creatures are the causes of diseased states, in connection with which they are sometimes found in particular abundance, or if their presence in unusual numbers is to be ascribed to disease previously existing.

ECTYPUM, a cast in relief of an ornamental design, produced from a mold.

ECUADOR, the Spanish term for *equator*, is the name of an independent state of South America, extending from lat. 1° 23' n. to 4° 45' s.; and from long. 73° to 81° 20' west. It measures, therefore, from n. to s. fully 500 m., and from e. to w. nearly 700, presenting an area of about 118,630 sq. miles. It is bounded on the north and east by the Republic of Colombia, on the s. by Peru, and on the w. by the Pacific ocean. Toward the e. it is drained by the Amazon, which receives all the rivers that fall down the eastern slopes of the Andes, while the country w. of the Andes is drained chiefly by the Mira, the Esmeralda, and the Guayaquil—the last named being more available for navigation than any other on the same coast of South America. The country is traversed nearly in the line of a meridian, by the two ranges of the Andes, which, alternating between union and separation, sometimes run into what are called knots, and sometimes inclose, at great elevations, plateaus or table-lands. Among these last, ranging from s. to n., the most important are those of Cuenca, Hambato, and Quito—their respective heights above the sea being, in feet, 8,640, 8,860, and 9,543. Lofty as these plateaus or table-lands are, they are beset, nay almost shut out from the world, by pinnacles of occasionally more than equal altitude above their own level. Of these the most remarkable are Chimborazo (q.v.) and Cotopaxi (q.v.).

The population of Ecuador in 1822, when it was made a part of the Columbian Confederacy, was estimated at 880,000. There is no regular census, but official statements respecting the population have been made from time to time, and on the basis of these, for the year 1889, it is estimated at 1,271,861, of whom the larger portion, probably about 60 per cent. are Indians, and only about 100,000 are whites, the descendants of Europeans. About 300,000 belong to the class called Mestizos, a mixed race, the offspring of Indians and Europeans. The number of illiterates is very large, it being estimated that hardly 100,000 can read and write. The backward condition of the Indians has led the government to treat them virtually as wards of the nation, although by the constitution distinctions of rank and race are not admitted. By a decree of 1896, however, the Indians were rendered exempt from paying tribute, and were admitted to citizenship. The present constitution of Ecuador was adopted in 1884, and modified in 1887. It seems to have been modeled on that of the United States of North America. The executive is vested in the president, elected for four years, and there is a congress of two houses. The principal exports are cocoa, coffee, ivory nuts, india rubber, and straw hats; the imports are cotton and other fibres, and provisions. The leading nations importing into Ecuador were, in 1893, in the order of their importance, Great Britain, France, United States, and Germany. In the same year France derived a larger amount of exports from Ecuador than any other nation, and after her, in order of importance, were Germany, Great Britain, United States, and Spain. The exports for 1895 were 11,000,000 sucres, and the imports 10,000,000. The estimates for 1896 place the exports at 12,000,000 and the imports at 9,000,000 sucres, the disturbed condition of the country having caused a decrease in imports. In regard to the financial condition of Ecuador, it may be noted that there were two well managed banks of issue in 1896, with a combined capital of 7,000,000 sucres, and that there were two or three other banks known as mortgage banks. The unit of value is the sucre, of silver, or paper redeemable in silver. It is of about the same weight and fineness as the United States silver dollar. There are no gold coins in circulation. The revenue from import and export duties, and internal taxes on salt, tobacco, and liquors, was about 7,000,000 sucres, from June, 1895, to July 30, 1896. Agriculture is in a very primitive condition. The soil is extremely fertile, but the lack of railroad connections with the coast, and of wagon roads, makes it profitable to till only a small portion. Gold, silver, and coal exist in various parts of the country, but they have not been profitably developed. Education is not general among the masses, only about 20 per cent. of the adults being

able to read and write. The army consisted, in 1896, of about 4,000 effective men, and the navy of two small boats. See *Bulletin No. 64*, of the Bureau of American Republics, and the *Statesman's Year Book* for 1897.

ECUMENICAL (Gr. *oikoumenikos*), i. e., universal, a term applied to ecclesiastical councils, regarded as representing the whole Christian church, or the church of the whole world (*oikoumenē*), and to the orthodox or Catholic church, regarded as opposed to heretical and merely local sects. The Roman Catholics claim the designation as appropriate to their own church. It is a title of patriarchs, archbishops, and ecclesiastical superintendents of provinces.

ECZEMA (from a Greek verb, "to boil out"), an eruption of small vesicles on various parts of the skin, usually crowded together, with little or no inflammation around their bases, and unattended by fever.

EDAM, a t. in North Holland, lies 12 m. n. e. from Amsterdam. It has seven entrances, and lies within a green dyke, ornamented by two rows of elm-trees. There is an extensive trade in wood and cheese. The principal industries are ship-building, rope-spinning, sawing wood, tanning leather, etc. There are Lutheran, Baptist, Roman Catholic, and Reformed churches, one of the latter having beautiful painted windows. In '91, pop. 6424.

ED'DA. There are two works which bear this title—the *Edda Sæmundar hins Froða*, or Edda of Sæmund the wise, and the *Edda Snorra Sturlusonar*. The former and older of these is a collection of the most ancient mythological and heroic Scandinavian songs, the date of whose composition may probably be referred to different periods between the 6th and 8th centuries. These songs, which are supposed to have been collected and arranged by Sæmund Sigfusson, surnamed Froði, an Icelandic priest, who was born in 1054, and died in 1133, were discovered and first brought before the notice of European scholars in 1643, by Brynjolf Sveinsson, bishop of Skalholt, who applied to them the name of Edda, or "grandmother." This collection was published entire at Stockholm, 1818, by A. A. Afzelius, after the text of Prof. Rask; and at Copenhagen, in 1787–1828, with a Latin translation, glossaries, etc. The third volume of this edition, which was completed by Prof. Finn Magnussen, consists chiefly of a very learned and copious lexicon mythologicum by the editor. Complete editions of the text of this E. were also published by Munch and Möbius, but all former editions have been superseded by the editions of Prof. Bugge of Copenhagen (1867), and of Svend Grundtvig (1868–74). Hildebrand's text (1876) is founded on theirs. Simrock made a German translation of both Eddas in 1851; and both Ettmüller and the brothers Grimm have translated a part of Sæmund's Edda. The Snorra Edda is a prose composition, and treats of Scandinavian mythology and of the language and modes of composition of the ancient skalds. As the name implies, it is referred to Snorri Sturlesson (q. v.), the learned author of the *Heimskringla*, who was born in Iceland in 1178, and died by assassination in 1241, on his return from Norway, where he had lived in the capacity of skald or court-poet. This E. was first published by P. J. Resen in 1665, under the title *Edda Islandorum An. Chr. mcccv. Conscripita per Snorronem Sturla*, etc. A complete edition of the prose E., and the most copious of all, was published at Stockholm by Prof. Rask in 1818. The trustees of the Arna-Magnæan legacy in Copenhagen have published an elaborate edition, with a Latin translation and notes; and a German edition of both Eddas, with glossary, etc., was published in 1859 by Lüning. A complete English translation of the poetical E., by Ben. Thorpe, was published in 1866. The best English translation of the mythological part of the prose E. is found in a translation of Mallet's *Northern Antiquities*, edited by Blackwall (1847). See also the translation of R. B. Andersen (1880).

ED'DOES. See Cocco.

EDDY, a co. in e. central N. Dakota, formed 1885 from part of Foster; 648 sq. m.; pop. '90, 1377. It is drained by the James and Sheyenne rivers and has a fertile soil. Co. seat, New Rockford.

EDDY, CLARENCE, American musician, b. in Greenfield, Mass., June 23, 1851. He studied under Dudley Buck in Hartford, and counterpoint under August Haupt, and the pianoforte under A. Loeschhorn in Leipsic. In 1894 he was made organist of the First Congregational Church in Chicago, where he became director of the Hershey School of Musical Art in 1876. Mr. Eddy has given many organ recitals in this country and in Europe. He has composed organ music, translated Haupt's *Counterpoint, Fugue, and Double Counterpoint* (1876), and published *The Church and Concert Organist*, etc.

ED DYSTONE, a group of gneiss rocks, daily submerged by the tide, in the English channel, 9 m. off the Cornish coast, and 14 m. s. s. w. of Plymouth breakwater. The rocks lie in lat. 50° 10' 54" n., and long. 4° 15' 53" e., and have 12 to 150 fathoms water around. The frequent shipwrecks on these rocks led to the erection of a light-house on them by Mr. Winstanley, 1696–1700. It was a wooden polygon, 100 ft. high, with a stone base; but a storm in 1703 completely washed it away, with the architect. Another light-house was built, 1706–9, also of wood, with a stone base, and 92 ft. high, by Mr. Rudyerd, a silk-mercator. This erection was burned in 1755. The next building, known as the Eddystone light-house, and noted for its strength and the engineering skill it displayed, was constructed by Mr. Smeaton in 1757–59, on the model, it is said, of the trunk of the oak-tree. It stood on the sloping side of one of the rocks, and was built of blocks, generally one to two tons weight, of Portland oolite, encased in granite, the granite dove-

tailed into the solid rock. The whole formed a circular tower 85 ft. high; the base was 26½ ft. diameter, and had 13 ft. of solid masonry on it. As the rock was undermined by the waves, it became necessary to take down the light-house, which was rebuilt 1879-82 on another part of the reef by Sir James Douglass, F.R.S. Its dioptric apparatus gives, at an elevation of 133 ft., a light equal to 159,600 candles, visible in clear weather to a distance of 17½ miles. See LIGHT-HOUSE.

EDELWEISS (noble-white), a perennial plant, *gnaphalium leontopodium*, belonging to the composite family; found in Switzerland, the Tyrol, Carinthia, and Alpine Austria generally, and Siberia. It bears terminal tufts of star-shaped white flowers, surrounded by woolly bracts, and sage-green leaves. Its notoriety is by reason not of its beauty, but of its scarcity, and the supposed difficulty of obtaining it, in its elevated haunts. In Swiss poetry, and legend, the peasant proves his love for his lady by risking his life to bring her the flower; see Auerbach's pathetic story, *Edelweiss*. This plant is so rare in Switzerland that several cantons protect it by law.

EDEN ("Delight"), according to the Scriptures, the first residence of man. The description given of it in the book of Genesis is brief, obscure, and in appearance legendary. The allegorical theory will be noticed under Fall (q.v.). In general, however, scholars have preferred to understand the story literally, and to believe that the writer or writers of it meant it to be so understood; but they have not, therefore, been unanimous as to the historical reality, or even the geographical position of Eden. The difference in their modes of apprehending the contents of the Hebrew Scriptures has manifested itself in this as in other *veritate questiones* of biblical criticism. Josephus and several of the fathers conceived that Eden was a term denoting the entire region between the Ganges and Nile; Calvin, Huet, Bochart, Wells, etc., have, with slight differences of detail, concluded in favor of Kornah in Babylonia, not far from the Persian gulf; Reland, Calmet, Hales, Faber, J. Pye Smith, in favor of Armenia, near the sources of the Tigris and Euphrates; Le Clerc, in favor of the region near Damascus; while the modern German school of biblical critics, convinced that the Hebrew account is traditional, and, in its present form, of very late composition, and impressed, besides, with the vast antiquity of the far east, have, almost without exception, turned their eyes in that direction, and sought the cradle of the human race in Bactria or Cashmere, or the region lying to the n. of it, a part of which is to this day called Audyana, the "garden." It may also be mentioned that the Mohammedans believe E. to have been in one of the seven heavens—some say the moon—and that the expulsion from paradise consisted in Adam being cast down upon the earth after the fall. It is useless seeking to identify the river system of E. with anything known at present. There is no river on the face of the globe of which the Euphrates and Tigris (Hiddekel) are separate "heads" (whether this means "sources" or "channels"), as they are said to be in the 2d chapter of Genesis, for, as maj. Rennell has shown, although the Euphrates and Tigris *now* unite, for a short space on their way to the Persian gulf, yet, until the time of Alexander the great, they kept entirely distinct courses; and therefore it has been assumed that the "deluge" completely altered the physical character of the region denoted by the term Eden. This was Luther's notion, to which, however, it has been objected, that the narrative in Genesis is so worded as to convey the idea that the countries and rivers spoken of were still existing in the time of the historian. Besides, the science of geology has thrown so much doubt on the universality of a deluge so late as the period assigned to Noah, that it is hazardous to argue on the hypothesis of any extensive physical changes having taken place since the first appearance of man on the planet; at least, if that be dated only some 6,000 years back. It will thus be seen that the question of the locality of E., or of the exact sense in which the Mosaic narrative is to be understood, is involved in inextricable mystery; and it has become a general opinion, that the spiritual significance of this primeval story is what principally concerns Christians—an opinion which derives force from the total silence of the New Testament in reference to the subject.

EDENTATA (Lat. toothless), an order of *mammalia* established by Cuvier, and generally received by naturalists. Cuvier remarks, that "although brought together by a purely negative character," the E. have, nevertheless, "some positive mutual relations, particularly in the great claws which encompass the ends of their toes, and which more or less approximate to the nature of hoofs; also in a certain slowness or want of agility, obviously arising from the peculiar organization of their limbs." He included among them, however, the *monotremata*, which, although so few in number, are now generally separated, on account of the very important differences of organization which characterize them. The remaining E. are divided into two tribes—1. *Tardigrada* (slow-paced), containing only the sloths; and, 2. *Effodentia* (diggers), containing armadillos, pangolins, ant-eaters, etc. The ant-eaters and pangolins are the only E. that are absolutely destitute of teeth; but none of the order have any teeth in the forepart of their jaws, and their teeth are comparatively imperfect in structure, being destitute of enamel and distinct roots. The sloths alone subsist on vegetable food, the rest chiefly on insects or on animal substances in a decaying state. The whole number of existing species of E. is not great.

EDESSA (modern name, *Urfah*, or *Orfa*), a very ancient city, on the river Daisan, in the n. of Mesopotamia, 78 m. s.w. of Diarbekir, although the Christian or Mohammedan legend, ascribing its foundation to Nimrod, or Khabiba, a female contemporary of Abraham, is unworthy of any credence. With the conquest of Persia by the Greeks,

the history of E. first becomes clearer. Seleucus, in particular, is said to have done much for the aggrandizement of the city. Christianity was introduced into E. at an early period. In the reign of Trajan, the place was made tributary to Rome, and in 216 A.D., became a Roman military colony, under the name of *Colonia Marcia Edessenorum*. During this period its importance in the history of the Christian church continued to increase. More than 300 monasteries are said to have been included within its walls; it was the seat of Ephraim Syrus and his school, and played an important part in the Arian and other controversies. With the extension of the religion of Islam, E. fell into the hands of the Arabian caliphs. Christianity declined, and wars at home and abroad during the caliphate, destroyed likewise its temporal splendor and prosperity, till, in 1040, it fell into the possession of the Seljuk Turks. The Byzantine emperors succeeded in recovering E., but the viceroy contrived to make himself independent. He was, however, hard pressed by the Turks, and this rendered it easy for the crusader Baldwin, the brother of Godfrey of Bouillon, to gain possession of the city (1097 A.D.), and make it the capital of a Latin principality, and the bulwark of the kingdom of Jerusalem. Under the Frankish princes, E. held out valiantly against the Mussulmans, till at length Zengi, ruler of Mosul, succeeded in taking the town and citadel in the year 1144, when all the Christian churches were converted into mosques. An attempt made by the inhabitants to throw off the Turkish yoke, completed the ruin of E.; the Edessenes were defeated by Nur-ed-din; and all who were not massacred, were sold as slaves. After many vicissitudes, in the course of which E. fell successively into the hands of the sultans of Egypt, the Byzantines, the Mongols, Turkomans, and Persians, the city was finally conquered by the Turks, and has ever since formed a portion of the Turkish dominions. On its site stands the modern city of *Orfa* or *Urfa*, with an estimated population of 55,000, of whom 40,800 are Mohammedans and 13,800 Christians. At present, E. has numerous mosques and bazaars; manufactures of cotton goods, goldsmiths' wares, and morocco leather, commerce in British manufactures obtained by way of Aleppo, and a large trade in corn, etc., with Syria. E. is regarded by the easterns as a sacred city, because they believe it to have been the residence of Abraham.

EDESSA, formerly known as *Ægæ*, the ancient capital of Macedonia, 46 m. w. of Thessalonica, at the head of a defile commanding the approaches from the sea-coast to the interior. It was the original residence of the Macedonian kings, and was the burial-place of the royal family long after it ceased to be the seat of government. In Edessa Philip II. was murdered by Pausanias, 336 B.C. The greater Alexander was buried at Memphis, but Edessa remained the royal burial-place, and when Pyrrhus occupied the place, the royal tombs were plundered by his Gallic mercenaries. The modern city of Vodena is built on the site of Edessa, and some remains of the ancient buildings are preserved.

EDFU, or *EDFOU* (Egypt. *Hut*; anc. *Apollinopolis Magna*), a town of upper Egypt, near the left bank of the Nile. It contains the ruins of the temple of Horus, one of the most perfect examples of Egyptian architecture that remain. The date of its foundation is uncertain, but the inscriptions that cover its walls show that the building in its present shape dates from the period of Ptolemy. Some authorities state that the builder was Ptolemy III. (237 B.C.) and that the work was completed 95 years later in the reign of Ptolemy IX. The entrance is by a gateway between two massive pylons over 100 feet high and covered with inscriptions. This entrance leads into a court, enclosed by a colonnade of 32 pillars, each with its own design. Back of this lies the hypostyle hall, with a roof supported by 18 columns, and then comes a second hall which opens into the vestibule of the sanctuary. In the passage around the sanctuary are several small chambers. The walls and ceilings are inscribed with various legends; among them that of the winged sun disc, telling the story of Horus, who was the tutelary deity of Edfu, and who is described as fighting the enemies of the god Ra, having assumed the form of a winged disc. The narrative represents him as victorious, typifying the victory of good over evil. Incidentally the story illustrates the Egyptian practice of ascribing the names of places and things to divine origin. Thus it makes the god Thoth exclaim, "This is a stabbing of my foes," and goes on to say that the nome in which Edfu was situated, was called "stabbing" (*Deb*) from that day. The interior of the temple court was formerly filled with rubbish and occupied by wretched dwellings, but early in the sixties, Mariette, by permission of the Khedive, cleared away the debris. The estimated population of modern Edfu is 5800. Its manufactures are cotton cloths, and a kind of earthenware similar to the ancient Egyptian pottery. See Brugsch, *Reiseberichte* p. 225; Lepsius, *Egypt and Ethiopia*, p. 117; and Wiedemann, *Religion of the Ancient Egyptians* (1897), p. 69.

EDGAR, a co. in e. Illinois, on the Indiana border, drained by affluents of the Wabash and intersected by the Cleveland, Chicago, Cincinnati, and St. Louis railroad; 630 sq. m.; pop. '90, 26,787. It has a level surface of prairie and timber land, and fertile soil. The chief productions are corn, wheat, oats, butter, and wool. Co. seat, Paris.

EDGARTOWN, town, port of entry, and co. seat of Dukes co., Mass., 75 m. s.s.e. of Boston. The port is on the e. side of the island of Martha's Vineyard, thirty miles from New Bedford, and has a well sheltered harbor. It is a summer resort and headquarters for whale-fishing. Near Edgartown is a grove which was long famous for Methodist camp-meetings. The town is intersected by the Martha's Vineyard rail-

road, and has a custom house, court house, high school, public library, churches, bank, and weekly newspaper. Pop. '90, 1156.

EDGECOMBE, a co. in n.e. North Carolina, on Tar river, intersected by the Atlantic Coast Line railroad; 520 sq. m.; pop. '90, 24,113, includ. colored. The surface is generally level, and the soil light and sandy. The chief productions are corn, cotton, and turpentine. Co. seat, Tarboro.

EDGECUMBE.—1. A bay in the e. coast of Australia, lies within the province of Queensland, near lat. 20° s., and long. 148° east. It is sheltered on every side but the north, its east barrier terminating in cape Gloucester.—2. A mountain in what was formerly Russian America, marks the n.w. point at the mouth of Norfolk sound, which connects the settlement of New Archangel on the island of Sitka with the open ocean. It rises from the water's edge as an almost perfect cone, which, during nearly the whole year, is capped with snow. It has been an active volcano within the recollection of some of the Russian colonists; and, even at the present day, the neighborhood presents indications of subterranean energy, such as tremblings of the earth, hot springs, and eruptions of smoke and ashes.

EDGEHILL, BATTLE OF. The first great battle of the civil war was fought on Sunday, 23d Oct., 1642, between the royalist forces under Charles and the parliamentarians under the earl of Essex. It was the intention of Charles, who had been lying at Shrewsbury, to march upon London by Wolverhampton, Birmingham, and Kenilworth; and Essex, who had thrown himself into Worcester, on being informed of the king's plans, marched forward to intercept him, and entered the village of Keinton, in Warwickshire, on the evening of the 22d. On the following morning, the royalist army was discovered a little in advance, and drawn up in order of battle on the elevation of Edgehill. The king's forces had the advantage in numbers and in cavalry, as well as in position; Essex, however, had the more formidable train of artillery. Charles had commanded that hostilities should be delayed until the enemy should open fire; accordingly no movement took place till about two o'clock, when Essex commenced the fight by firing upon the royalists, who immediately replied with their cannon. The royalists then began to descend the hill, and prince Rupert, who led the right wing, charged with his cavalry the left wing of the parliamentarians, broke it, and pursued it madly to Keinton, where his men, regardless of the main army, busied themselves in plunder. This was the fatal movement of the day. The right wing of the parliamentarians had charged and recharged with the greatest success, until, after some stubborn fighting around the royal standard, the royalists broke, and retreated toward the hill. That night 4,000 men lay slain at the foot of Edgehill, and of these the greater number were royalists.

EDGEFIELD, a co. in w. South Carolina, on the Savannah river, by which it is separated from Georgia; 1352 sq.m.; pop. '90, 49,259. The surface is hilly, and the soil moderately fertile. Co. seat, Edgefield.

EDGEWATER, a village in Richmond co., N. Y.; on Staten Island and New York bay, and the Staten Island Rapid Transit railroad. It is an attractive suburb, with churches, a bank, electric lights and railroads, U. S. marine hospital, Staten Island hospital, public park, brewery, and looking-glass factory. It is the home of many New York business men. Pop. '90, 14,265.

EDGEWORTH, MARIA, the daughter of Richard Lovell Edgeworth, of Edgeworthstown, co. of Longford, Ireland, was born at Hare Hatch, near Reading, Berkshire, in the year 1767. In 1782, her father returned to Ireland, accompanied by his family, to whose education he earnestly devoted himself. Maria's talents quickly developed themselves. Her first literary effort was written in conjunction with her father, and was entitled *Essays on Practical Education* (1798). In 1801 appeared the *Essay on Irish Bulls*, which was also in part the work of Mr. Edgeworth. But it was in the sphere of fiction that Miss E. won her greatest triumphs. In 1801, she published *Castle Rackrent*, the first of a pretty extensive series of novels characterized in general by a quiet, agreeable humor, excellent sense, and lively delineation of character and manners. It has been objected by critics, however, that some of them are too manifestly didactic to please as fiction should please. In 1803 appeared *Belinda*; in 1804, *Popular Tales*; in 1806, *Leonora*; in 1809, *Tales of Fashionable Life*; and in 1812, a second series of the same. The last of the series was "Helen," which was published in 1834. Among the most successful of her *Tales of Fashionable Life* were "Ennui" and "The Absentee." Miss E.'s stories for children—the last of which, *Orlandino*, appeared in *Chambers's Library for Young People*—are deserving of high praise. This gifted and universally respected authoress died at Edgeworthstown, 21st May, 1849.

EDGEWORTH, RICHARD LOVELL, 1744–1817; b. Bath, England; the father of the celebrated authoress, Maria Edgeworth, and associated with her in literary labors. He was an intimate friend of Dr. Erasmus Darwin. Among his writings are *Professional Education*; *Practical Education*; *Essay on Irish Bulls*; and autobiographical memoirs.

EDHEM PASHA, Turkish statesman, b. of Greek parents on the island of Scio, in 1823. When a child he was sold as a slave to Khosseo Pasha, who subsequently gave

him his liberty and had him educated at Paris. He was appointed to the general staff of the Turkish army; became adjutant to the sultan in 1849 and general of division; was minister of the interior in 1856-7; minister of foreign affairs in 1867-77; ambassador to Germany; grand vizier in 1877-79; ambassador to Austria; minister of the interior in 1883-85; became ambassador to France in 1885; and commanded the Turkish forces operating against the Greeks in 1897.

EDIBLE BIRDS' NESTS, or **EDIBLE SWALLOWS NESTS**. See **NESTS**, **EDIBLE**.

EDICT (Lat. *edictum*). The power of making edicts (*jus edicendi*) belonged generally to the higher magistrates at Rome; but it was by the curule ædiles, and more extensively still by two prætors—the *prætor urbanus*, and the *prætor peregrinus*—that it was prominently exercised. In a province, the jurisdiction of the prætor passed to the *præses*. As this power was co-extensive with the possession of what were called the honors (*honores*), it was frequently spoken of as the *jus honorarium*; and from its being exercised chiefly by the prætors, it was also known as the *jus prætorium*. The edicts of the prætors are mentioned by Gaius among the sources of the Roman law; but, strictly speaking, they are to be considered as rules promulgated by the magistrates on entering on office, rather than as expressions of the will of the Roman people, either direct or indirect. The E. of one prætor was not binding on his successor, but very often edicts were adopted and confirmed, and this came gradually to constitute a very important body of law. They were frequently known by the names of their first promulgators, though they were often named with reference to the formula and the *actio* which they established. The power of promulgating edicts is supposed to have flowed down from the kings to the consuls, and through them to the prætors, and thus to have formed part of what we should call the royal prerogative. Even in Cicero's time, the study of the E. had become a regular branch of the study of the law. In 67 B.C., the Lex Cornelia provided against the abuse of passing edicts for the decision of particular cases by requiring the prætors to decide in conformity with the edicts which they promulgated with reference to their whole tenure of office, which were known as perpetual edicts. Servius Sulpicius, the friend of Cicero, addressed to Brutus a work on the subject; and Ofilius made what was probably a compilation of the various edicts, resembling the subsequent one by Julian. The object of the E., according to the Roman jurists, was to aid, supplement, and correct the civil law, and to render it more conducive to the public service, and they speak of it as "the living voice of the civil law." It was, in short, an indirect form of legislation, which public opinion had sanctioned for the public convenience; and there can be no doubt that it contributed what was ultimately the most valuable part of the Roman law. There were many commentators on the edicts under the emperors, amongst whom Labeo is mentioned and cited by Ulpian (*Dig.* 4, tit. 3, s. 9). Julian is supposed to have collected and arranged the edicts, and given to them a systematic form. Gaius, Ulpian, and Paulus composed treatises on the edicts of the curule ædiles; and it is chiefly from the writings of these and the other jurists excerpted in the *Digest*, that we know anything of the character of the E., the portions of it which have been preserved being mere fragments. They have been collected by Wieling in his *Fragmenta Edicti Perpetui* (Frank. 1733).

EDICT OF NANTES. See **NANTES**.

EDICTAL CITATION, or **INTIMATION**. By the former practice of Scotland, where the party to be cited before a civil court was out of Scotland, the citation required to be given by a messenger-at-arms making proclamation at the market-cross of Edinburgh, and at the pier and shore of Leith. The idea, of course, was, that the fact was thus more likely to reach the absent party than if it had been intimated or published in any other manner.—Erskine, b. i. tit. 2, s. 18. But the practice in this matter was altered by the so-called judicature act (6 Geo. IV. c. 120), and the subsequent statute, 13 and 14 Vict. c. 36, s. 22, which enacted that services against persons forth of Scotland should be done by delivery of copies at the record office of the keeper of the records of the court of session. Abstracts of the copies delivered to the keeper are ordered to be recorded by him, and to be printed periodically at the end of each successive 14 days, and the record is to be at all times open for inspection. In criminal cases, the old forms still remain unaltered.

EDINBURGH, the capital of Scotland, and chief town in the co. of Mid-Lothian, occupies a picturesque situation on a cluster of eminences, at a distance of about a mile and a half from the firth of Forth (q.v.), which is here about 6 m. in breadth. The outskirts extend almost to the shore, and a connection has thus been formed on the n. with Leith, the ancient port; Newhaven, a fishing village; and Granton, a modern and rising port. The admirable position of E. has induced the comparison with Athens, from which, as well as its literary fame, it takes the title "Modern Athens." The Gaelic name of the city is "Dunedin."

The castle, which crowns the highest point in the city, was undoubtedly built first, a town gradually forming on the top and sides of the ridge, which slopes downwards to the east. For some centuries the city was confined entirely to this ridge or hill, and was flanked on the n. by a lake or marsh called the Nor' Loch. The remaining means of defense was a wall built by the citizens about the middle of the 15th c., a few relics of which, of different eras, still exist. E. was therefore a fortified town, protected by

the castle at its western extremity. When David I. was induced by his piety and munificence to found the abbey of Holyrood in the low ground eastward of the city, he at the same time empowered the canons of this religious house to found a burgh in a westerly direction towards the city of E., and thus was built the Canongate, afterwards united to the city. The beautiful abbey itself has been a ruin since the fall of its roof in 1768. In connection with the abbey sprung up the palace, which became a favorite abode of the Scottish sovereigns. Not, however, till about the era of the murder of James I. at Perth in 1437, did E. become the recognized capital of the kingdom. Neither Perth nor Seone, Stirling nor Dunfermline, being able to offer to royalty security against the designs of the nobles, E. with its castle was thenceforth selected as the only place of safety for the royal household, the parliament, the mint, and the various important government offices. By this means rising in importance, E. became densely peopled, and the houses were built to an unusual height, that the inhabitants might keep within the walls for the sake of protection. The town then consisted of the original main way called the High street, reaching to the Canongate, and a parallel way, narrow and confined, on the s., called the Cowgate, connected with each other by upwards of 100 narrow cross alleys or closes, between dense clusters of houses. Most of these houses consisted of a succession of floors or flats, each being a separate dwelling, and of such floors there were seldom fewer than 6, and sometimes 10 or 12, towering to an immense height, and rendered still more imposing from being built on an eminence.

The citizens remained content with these confined limits till about the middle of the 18th century. Between 1763 and 1769, the North bridge was erected, connecting the old city with the fields on the n., on which the *New Town* was beginning to be built. Shortly afterwards, in 1788, the line of this bridge was extended southwards by 22 arches (the South bridge), only one of which is seen where the structure spans the Cowgate, and thus a level way was opened to the southern suburbs, which have since rivaled the new town in rapid growth. George the Fourth's bridge was erected over the same valley a short distance to the westward, a considerable time afterwards. The Nor' Loch was drained and partially bridged over by the Mound formed from the earth dug from the foundations of the new town, and its situation is occupied by fine public and private gardens which now lie in the center of modern E., and separate Princes street, the south-most and most picturesque street of the new town, from the old town. Two other bridges give access to E.—the Regent's bridge, Waterloo place, which arches the valley between Princes street and the Calton hill to the e.; and at the w. end, the fine Dean bridge over the water of Leith, which is 106 ft. high. On May 25, 1896, the foundation of a new North bridge was laid. According to the plan, the length is 525 feet and the bridge consists of three spans. The new town being built with much regularity in straight streets, and in squares and crescents with numerous gardens, contrasts with the crowded though picturesque masses of the old town. The dilapidated and dangerous state of part of the old town, and the necessities of sanitary ameliorations in the overcrowded buildings, have occasioned great changes of recent years, and several new streets have been opened up through the most crowded and ruinous localities.

Altogether built of durable sandstone from quarries in the neighborhood, the general aspect of the houses is that of great solidity. Among the most interesting features of the town are the castle, in which are shown the ancient regalia of Scotland; the parliament house, used by the Scottish parliament before the union; St. Giles' cathedral, with a magnificent crown on the central tower; the abbey and palace of Holyrood (q. v.); the bank of Scotland; the Scott monument, designed by a native self-taught artist; Heriot's (q. v.) and Donaldson's (q. v.) hospitals; the general register-house, where all heritable titles and state documents are recorded and preserved; the post-office; the royal institution, where the royal society, and the society of antiquaries of Scotland meet; national gallery; the assembly hall of the church of Scotland; an Anglican cathedral; the university and museum of science and art; the Episcopal churches (St. John's and St. Paul's); and the banks, clubs, insurance offices, and hotels of Princes street and George street. The monument on the Calton hill is striking from its position. The country round E. is finely varied. From Arthur's seat and Salisbury crags, on the s.e., the eye wanders to the Braid hills on the s., and the richly wooded Corstorphine hill on the w., all within a mile or two of the town; while further off begin the Pentland hills, 4 m. to the s.e.; and to the n. the firth of Forth, and the Fife coast and hills, form a magnificent background. The climate is bracing and healthy, although the situation is exposed, not so much rain falling as on the w. coast, and high winds are very prevalent.

E. is not an important manufacturing town, though it derives considerable commercial importance from its various banks and insurance offices, round which revolves no mean portion of the monetary capital of Scotland. The principal industries are brewing (two thirds of all the ale or beer brewed in Scotland being made in or near E.), printing and publishing with the kindred arts (see BOOK-TRADE), distilling, ironfounding, tanning, and coachbuilding, manufacture of articles in India-rubber, of house-furniture, and of jewelry, and the rearing of young trees in nurseries in and around the town, for which the climate is favorable.

E. is the place of residence of considerable numbers of the Scottish landed gentry, and its society is regarded as unusually polished from the predominance of the professional

and literary elements in its composition. This arises partly from its being a university town, and partly from the presence of the supreme law courts of Scotland, all the important legal business being attracted thither on that account; the Edinburgh lawyers have charge of most of the landed estates throughout the northern part of the kingdom, so that there is an unusual number of advocates (barristers), writers to the signet, and solicitors (attorneys and conveyancers), and accountants. Its medical practitioners—surgeons and physicians—have a high reputation. E. is much resorted to for the sake of education, for its university (q.v.) and medical schools, its high school, and its various other educational institutes. The Free church and the United Presbyterian church have each a well-equipped divinity hall in E. The opening in 1869 of the merchant company's schools, which (by utilizing certain surplus hospital funds) provide high-class instruction at moderate charges, has added to the influx of residents desirous of availing themselves of this boon. For the poorer classes, part of the enormous funds of George Heriot's charity have been diverted for cheaper schools throughout the town. Fettes college is a foundation school on the model of Rugby and Eton, and is a handsome edifice.

E. is largely resorted to by visitors to the Highlands of Scotland, and has an unusual number of hotels. There are two theaters, and abundance of amusement, including a large open-air gymnasium. In the southern environs are fine open links or downs, where the game of golf (q. v.) has been played from time immemorial. Excellent street cabs are to be found, and tramways are laid to the suburbs.

E. is the seat of various Scottish boards (poor-law supervision, lunacy, fisheries, school, northern light-houses, etc.); in it the Established and Free churches hold their annual assemblies and courts, as do the United Presbyterians.

E. is a royal burgh, governed by a town council composed of 41 members. The town council elects from its own body a lord provost and six bailies, who constitute the civic magistracy. E. is represented by four members in parliament.

In 1821 the pop. was 112,235; in 1861 it was 167,851; and in 1871, 196,979. Number of inhabited houses, 10,529; parliamentary and municipal constituency (1878-79), 28,342. Pop. 1891, 264,796; 1896, 276,514.

EDINBURGH, ALFRED ERNEST ALBERT, Duke of, third child and second son of queen Victoria; b. Aug. 6, 1844. He is also a duke of Saxony, and in 1893 became reigning duke of Saxe-Coburg-Gotha. He was educated by special tutors, and at the age of 14 went into the royal navy, serving chiefly in foreign stations. The crown of Greece was offered to him in 1862, but he declined it. In 1866 he took his place in the house of lords; in 1867 he commanded the frigate *Galatea* on a voyage to Australia and India. He attended a picnic in New South Wales, where an Irishman fired at and slightly wounded him. The duke married at St. Petersburg, Jan. 21, 1874, Marie Alexandrowna, grand-duchess of Russia. They have five children, a son and four daughters.

EDINBURGH, THE UNIVERSITY OF, took its rise from a bequest in 1558 by Robert Reid, bishop of Orkney, of 8,000 merks; but the sum was retained for a considerable time by the abbot of Kinloss. The magistrates of the city, on the faith of receiving the bequest, purchased in 1563 a portion of the ground on which the present university stands. Queen Mary was anxious that the proposed institution should succeed, and bestowed upon it grants of confiscated church property. The university was formally founded by king James VI. in 1582 by royal charter, in virtue of which the corporation, up till 1858, remained its patrons or governors. In 1583, the work of instruction began under Robert Rollock, the first regent. Originally, the university consisted of but one class and one regent or teacher. The regent had charge of the students from their enrollment to their laureation at the close of the fourth session of study. As the university prospered, additions were made to the staff of regents, and separate chairs for the several branches were founded. In the beginning of the 17th c., the *senatus academicus* consisted of a principal and four regents. The first theological chair was instituted in 1642, and the first professor of medicine was appointed in 1685. After 1688, the university of E., along with its sister universities, was subjected to a parliamentary visitation. The commission was issued in 1690, and till the close of the century the university was under its control. Under this supervision, a separate chair of Greek was established; and after 1708, the present arrangement of the faculty of arts came into existence. About this period, the faculty of law was created. During the 18th c., the professoriate rapidly increased; and in 1760, the *senatus academicus* contained 18 professors and a principal. Twenty-three chairs have since been added. In 1858, an act of parliament was passed, by which the constitution of the university was materially changed. The government was taken out of the hands of the lord provost, magistrates, and town-council of the city, and placed in the *senatus academicus* and a university court; and the patronage of the chairs—from 1582 in possession of the corporation—was transferred to seven curators, three of whom are nominated by the university court, and four by the town-council. A general council was also established, consisting of graduates of the university, and all persons who, up till Aug., 1861, could satisfy the university commissioners that they had given attendance on four complete sessions of the university. This general council now consists solely of the grad-

uates of the Univ.; and members of this body, together with the professors and university court, have the right of voting in the election of a member of parliament for the universities of Edinburgh and St. Andrews.

Matriculation, Faculties, Degrees.—Students entering any class in the university, are required to inscribe their names in the general matriculation album of the university, which is the legal record of attendance; and the matriculation ticket serves as a passport to the privileges of the university library. The university consists of the faculties of arts, medicine, theology, and law. The faculty of arts comprises the chairs of humanity, Greek, mathematics, logic and metaphysics, moral philosophy, natural philosophy, rhetoric and belles lettres, universal history, practical astronomy, agriculture, music, Sanscrit, engineering, geology, political economy, fine arts, and education. Attendance on the first seven of these is incumbent on every one proceeding to the degree of M.A. The medical faculty comprises the chairs of institutes of medicine, materia medica, medical jurisprudence, chemistry, surgery, practice of physic, anatomy, pathology, midwifery, clinical medicine, clinical surgery, botany, natural history. The faculty of theology comprises the chairs of divinity, ecclesiastical history, Biblical criticism and antiquities, Hebrew. The faculty of law comprises the chairs of civil law, public law, law of Scotland, conveyancing. The degrees granted by the university are master of arts, bachelor of medicine, master of surgery, doctor of medicine, bachelor of science, doctor of science, bachelor of divinity, doctor of divinity, bachelor of laws, doctor of laws. A chair of Celtic was added, 1882, to the faculty of arts.

Libraries, Museum, Societies.—The university library originated in a bequest, in 1580, by Mr. Clement Little. The bequest amounted to about 300 volumes. It enjoyed the right of receiving every book entered in Stationers' hall, but a composition of £575 per annum in lieu of the privilege was subsequently accepted. The university library contains about 150,000 printed volumes, and 2000 volumes of MSS. The university also contains subsidiary libraries, such as the theological library, the humanity class library, etc. The natural history museum was established in 1842, and received a government grant of £200 per annum. It was in 1854 transferred to the new museum of science and art, where it forms a natural history department, of which the professor of natural history is the regius keeper. The anatomical museum was founded by the town-council and the senatus academicus in 1826. The botanical museum is stationed in the botanic garden, which is in connection with the university, and several valuable museums exist as appendages to classes. There are several societies in connection with the university, which meet in its buildings during the winter session.

Bursaries.—There are considerably upwards of 100 bursaries and prizes connected with the university of E., and the total yearly amount of these may be estimated at more than £15,000. These bursaries are appropriated to the different faculties, and are in the patronage of the senatus, the town-council, and of private individuals. Their yearly values range from £5 to £90, and they are generally held for a period of four years.

Scholarships and Fellowships.—There are numerous scholarships, ranging in value from £30 to £120, and fellowships, from £100 to £160 per annum.

Students.—The number of students has of late been steadily increasing, and in '95 was 2836. Women have been admitted to graduation in Arts and Sciences since 1892. The existing buildings (erected 1789-1816) proving insufficient, stately new buildings have since then been erected. See Principal Sir A. Grant's *Story of the University of E.* (1883).

EDINBURGH REVIEW, the first of the great critical periodicals which form a distinguishing feature of the literature of the 19th century. It was started in Oct., 1802, by a knot of young men living in the northern metropolis, the principal of whom were Francis Jeffrey (q.v.), Sidney Smith (q.v.), F. Horner, and Henry Brougham (q.v.). So much was secrecy felt or believed to be necessary to the success of the undertaking, that, according to the account which lord Jeffrey gave to Mr. Robert Chambers in 1846, "the dark divans" of the reviewers were held for some time "in a dingy room of Willison's printing-office in Craig's Close," to which each repaired alone, and "by back approaches or different lanes." Of the first number, 750 copies were printed: the demand exceeded this limited supply; 750 more were thrown off, and successive editions followed. In 1808, the circulation had risen to about 9,000, and it is believed to have reached its maximum—from which it has declined—in 1813, when 12,000 or 13,000 copies were printed. The pay of contributors was at first ten guineas a sheet, but shortly after "the *minimum*," says Jeffrey, "was raised to sixteen guineas, at which it remained during my reign. Two thirds of the articles were, however, paid much higher, averaging, I should think, from twenty to twenty-five guineas a sheet on the whole number." The original publisher was the well-known Constable. The political views advocated in the early pages of the *Edinburgh Review* were *whig*, and to these it has consistently adhered to the present day. Its influence in developing and strengthening the political convictions of the whig party cannot be overestimated; but its power was even more visible, certainly more immediately palpable, in literature. Amid the feeble and effete periodicals of the day, it burst like a bombshell. The keenness of criticism,

the sharpness of wit, the brilliancy of style, the vigor of mind and comprehensiveness of knowledge exhibited by the writers, excited amazement and fear in the world of letters; and although, in the case of Wordsworth, Southey, and other writers of a certain school, unfairness of a flagrant kind was undoubtedly exhibited and persevered in, yet impartial justice was, on the whole, administered, and the rising generation of authors strained their utmost to escape the lash. Since the period of Jeffrey, the most brilliant contributor to the *Edinburgh Review* was Macaulay. See Napier's *Correspondence* (1879).

EDINBURGHSHIRE, or MID-LO'THIAN, the metropolitan co. of Scotland, lying on the s. side of the firth of Forth. Its greatest length from e. to w. is 36 m., and its breadth 18 m., with an area of 362 sq. miles. From the s. border, the Pentland hills (mean height 1000 ft., and highest point 1898 ft.) and the Moorfoot hills (mean height 800 ft., and highest point 2,136 ft.) run n.e. through the county. In the n. are fertile plains, varied by gentle slopes, ridges, and hills of trap. The coast, 13 m. long, is partly sandy, and is studded with towns, villages, and piers. The chief rivers are not above 20 m. long, and are the Esk, Water of Leith, Almond, and Gala Water. Four great roads and five great railways traverse the county. E. chiefly consists of carboniferous strata, with protrusions of trap. Some lower Silurian rocks occur in the s.e. Coal and iron are chiefly worked in the broad valley of the Esk. Here the bed of coal extends 15 by 8 m., and contains 33 seams $\frac{1}{2}$ of a foot to 6 ft. thick. Near the western boundary of the county are valuable oil shales. The fine sandstone quarries of Craigleith contain large fossil trees, and the limestone of Burdiehouse is famed for fossil fishes. Cold and dry e. winds prevail in spring. Clay soil predominates. The county is chiefly agricultural, with large farms. The harvest is a week earlier on the coast than at the height of 200 ft., and a fortnight earlier than at the height of 600 feet. Near the metropolis are extensive nurseries, vegetable and fruit gardens, and dairy pastures. Pop. '91, 434,276. Although not important as a manufacturing county, there are considerable manufactures of various goods in Edinburgh, Leith, and Musselburgh; and there are large paper-mills along the course of the North Esk. Much paraffin oil is made from the rich bituminous shale found within the county. E. returns one member to parliament for the county. The chief towns are Edinburgh, the metropolis of Scotland; Leith, its seaport; Dalkeith, Musselburgh, and Portobello. In E. have been found cairns, stone circles, Roman coins and utensils, and traces of Roman camps and burying-places. E. was included in the Roman province Valentia, and Cramond is supposed to have been a chief Roman port. It afterwards formed part of the kingdom of Northumbria, 446-1020. The county contains many feudal and ecclesiastical remains, as Borthwick castle, Cragmillar castle, and Roslin chapel.

EDISON, THOMAS ALVA, b. Ohio, 1847, of a mother of Scotch and a father of Dutch descent. The boy had scarcely eight weeks of common school education, but he had a passion for reading, and his education was greatly advanced by the assiduous care of his mother, who, however, died when he was but 15 years old. Before he was 12 he had read Hume and Gibbon, and all that he could get of the *Penny Cyclopædia*. He had a liking for chemistry, and such a thirst for all kinds of knowledge, that he firmly resolved to read every important book in the Detroit public library. With this design he went through Newton's *Principia*, Ure's *Dictionary of Science*, and by way of dessert, Burton's *Anatomy of Melancholy*. Becoming a newsboy on the trains of the Grand Trunk railroad, his employment introduced him to a more varied range of books. The infection of chemistry clung to him, and was developed by his establishing a laboratory in an empty car. But his chemicals exploded, set the car on fire, and put the train in great danger. The boy and his broken apparatus were promptly thrown out of the car by the indignant conductor. The next venture of the young enthusiast was in getting a small lot of type, and issuing on the train a small sheet called *The Grand Trunk Herald*. Becoming acquainted with telegraph operators, he determined to learn the art himself. A kind-hearted station-master consented to give him lessons, and for several months Edison returned to that station after a long day's work, and took his regular lessons at night. He became an expert operator, and was employed at Port Huron, Mich., Stratford, Canada, and Adrian, Mich., where he also prepared a small workshop and began to repair telegraph instruments and manufacture other novel machinery. From this place he went to Indianapolis, where he invented his automatic repeater, an instrument by which messages are transferred from one wire to another without the aid of an operator. He wandered to Cincinnati, Louisville, Memphis, and New Orleans, returned to Cincinnati, and at the age of 20 began to be known as a successful inventor. But he was called to Boston on telegraph business, having become famous as one of the most expert of operators, and there he set up a shop for his experiments. Testing, in 1870, between Rochester, N. Y., and Boston, his new invention of duplex telegraphing, he was not successful; but he was employed by the gold indicator company in New York, of which he became superintendent. While in this position he brought out some new inventions, and introduced improved apparatus. At the same time he set up a factory in Newark, N. J., for making his novel apparatus and machines. Here he employed 300 persons; but the superintendence took so much of his time that he gave it up, and, in 1876, set up a small experimenting establishment at Menlo Park, on the Pennsylvania Railroad, 24 m. from New York. This establishment soon grew to be

almost a village in itself. His main laboratory, at Orange, N. J., is the Mecca of all men interested in the perfection of artificial lighting by electricity. His inventions are all practically useful, and are unlimited in their range; from the motor for sewing machines to the microtasmeter, which measures infinitesimal variations of temperature, and by means of which the heat of the sun's corona, as well as that of the stars, has been investigated. The number of inventions great and small, already patented by Edison, is said to be over 700. The most important are the carbon telephone, the phonograph, the electric fire-alarm, the *ædiphone*, the megaphone, the phonometer, the electric pen, the quadruplex system of telegraphing, by means of which four messages at the same time may be sent in opposite directions over a single wire, and perfectly delivered, the kinetoscope, the vitascope, and the fluoroscope, with which he was able to see the bones of the hand and other hidden objects. (See *ELECTRIC LIGHT*.) In 1878 he was made a chevalier of the Legion of Honor by the French government, and in 1889 a grand commander, in recognition of his great services and of his remarkable exhibit at the Paris exposition.

EDISTO, a river of South Carolina, flows through the s.w. part of the state, being formed near Branchville of the North Edisto and the South Edisto, and entering the Atlantic by two arms respectively named from the two confluents. E. also designates the island which separates those two arms. The stream is navigable for 100 m. upwards, and its mouth is about 20 m. to the s.w. of Charleston.

EDISTO ISLAND, one of the "sea islands" so famous for long-staple cotton, on the South Carolina coast, between North and South Edisto inlets.

EDITIO PRINCEPS, the first edition of a book. The term is especially used with reference to the first printed edition of a Greek or Latin author.

EDITION DE LUXE, the finest edition of a work, in which everything is of the most excellent quality. The best paper is used; the type is very clear and distinct; and all the embellishments are of the highest order. In general only a limited number of copies of an edition de luxe are offered for sale; and these are generally sold by subscription.

EDMONDS, JOHN WORTH, b. N. Y.; 1799-1874; a graduate of Union college, admitted to the bar in 1819, and practiced law in his native city (Hudson). In 1831, he was a member of the state assembly, and of the senate (then the court of errors) from 1832 to 1835. In 1837, he removed to New York city; in 1845, he was appointed one of the circuit judges; in 1847, judge of the supreme court, and in 1852, one of the judges of appeals. About 1851, he became convinced of the truth of spiritual manifestations, and in 1853 publicly declared his faith—preparing and publishing a work entitled *Spiritualism*. He became a leading champion of the doctrines, and his well-known ability as a jurist was of great advantage to the unpopular innovation.

EDMONSON, a co. in central Kentucky, watered by Green river, crossed by the Louisville and Nashville railroad; 348 sq.m.; pop. '90, 8005, incl. colored. The surface is uneven; soil tolerably fertile; coal is abundant. The chief productions are corn and tobacco. The county contains the famous Mammoth cave. Co. seat, Brownsville.

EDMONTON, a large village in the n.e. of Middlesex, near the Kerr, 7 m. n.e. of London. Pop. of parish '90, 25,380. It contains many villas of London merchants, etc. Charles Lamb is buried in the churchyard here. E. is connected with Cowper's humorous poem of *John Gilpin*.

EDMONTON, a town in the district of Alberta, Northwest Territories, Canada; on the Saskatchewan river and the Calgary and Edmonton railroad. Gold, silver, wood, and coal are found in the vicinity, and coal mining is the principal industry. It has several churches, electric lights, branch bank, and newspapers. Pop. '91, 2000.

EDMUND I., or **EADMUND I.** (*ÆTHELING*), 922-46; son of Edward the Elder, grandson of Alfred the Great, and king of the Mercians and West Saxons, succeeded Athelstan (his brother) in 941, at the age of 18. He had shown remarkable bravery three years before in the battle with the Danes at Brunanburg. At the time of his succession the Northumbrians brought over from Ireland Anlaf, a Danish king of Dublin; the Danes joined them, and Edmund was compelled to make a large cession of territory. After the death of Anlaf, Edmund freed his own kingdom, subdued the Britons of Cumberland, and gave their territory to Malcolm of Scotland to secure his co-operation in military service. Edmund was assassinated by an outlaw May 26, 946, while at a banquet.

EDMUND, SAINT (**EDMUND RICH**), 1170-1240; b. Abingdon, England; the son of a mother whose piety amounted to ascetic fanaticism, and from whom he learned to become a self-tormentor. He got a tolerable education at Oxford, where he became a teacher in the university. His tendency of mind was to theology, so he became a priest, and was the first Englishman to receive the title of doctor of divinity. In 1227, he was one of the preachers of the sixth crusade. In 1234, he was consecrated archbishop of Canterbury. In 1236, he married king Henry III. to Eleanor, daughter of the count of Provence; but he was soon at enmity with the king, who induced the pope to send to

England a legate who should have authority above that of Edmund. The latter was now in disfavor with both king and pope, and made a journey to Rome to effect a reconciliation; but he was insulted by the pope, and returned to England broken in spirit and resources. In 1240, he went to Pontigny, France, where the queen of France and her sons came to receive his blessing. To find improvement in health, he went to Soissy, where he died. His tomb became immediately famous for miracles, and six years after his death, the man who had always protested against the robbery of the people by the church was proclaimed a saint by the act of canonization.

EDMUND IRONSIDE, king of the Anglo-Saxons, son of Ethelred II., and half-brother of Edward the Confessor, was b. in 989. He calls for notice chiefly as the great opponent of Canute and the Danish party. On the death of Ethelred, the Danes proclaimed Canute king of England; but the citizens of London declared for E., who drew together his forces, and engaged Canute, first at Pen, in Dorsetshire (or, as other accounts say, at Gillingham, in Somersetshire), then at Sceaorstan, and again at Ottenford, or Otford, in Kent, in all of which battles he was victorious; but a severe defeat which he sustained at Assandun, in Essex, compelled him to compromise with his adversaries. An arrangement was entered into by which England was divided between the two kings, Canute obtaining possession of Mercia and Northumbria, the rest falling to the share of Edmund. It was also agreed that on the death of either, the survivor was to succeed him. E. having died a few weeks after this agreement had been drawn up, Canute became king of all England, Nov. 30, 1016. E. received the surname of *Ironsides*, either from his great strength or from his armor.

EDMUNDS, a co. in northern S. Dakota, formed in 1873; intersected by several railroads; surface somewhat broken; pop. '90, 1155. Co. seat, Ipswich.

EDMUNDS, GEORGE FRANKLIN, born Vt., 1828. Besides a common school education he had the advantage of a private tutor; studied law at an early age, and was admitted to the bar in 1849. He settled in Burlington in 1851; and in 1854, and successively for four years, he was chosen to the popular branch of the state legislature, for three of the five years being speaker of the house. In 1861-62, he served in the senate, where he was speaker *pro tem*. When the civil war broke out he was a member of the state convention which met to form a coalition between the republicans and the war democrats, and he drew up the resolutions adopted by that convention as the basis of union. At the death of Solomon Foot, Edmunds was appointed to fill the vacancy from Vermont in the U. S. senate, and taking his seat in April, 1866, held office till his resignation, 1891. In the federal senate he has served on the committees on commerce, public lands, pensions, retrenchment, the judiciary, etc. He was a delegate to the Philadelphia "loyalists'" convention in 1866; was for several years at the head of the judiciary committee of the U. S. senate; and was author of the anti-polygamy acts of 1882 and 1887. His name was mentioned several times for the republican presidential nomination.

EDMUND'S (Str.) HALL, Oxford, derives its name from St. Edmund, archbishop of Canterbury in the reign of Henry III. As early as 1269, it appears to have been purchased by the canons of Osney, and devoted to purposes of education. On the dissolution of religious houses under Henry VIII., it fell into the hands of two citizens of Oxford, who sold it to William Denyse, provost of Queen's college. The provost devised it to his college, and that society accordingly now nominates the principal of St. Edmund's Hall. There are ten exhibitions attached to the hall, value £30 per annum, appropriated to students designed for holy orders, and in the gift of the principal. In 1890, there were 43 undergraduates.

EDOM (New Testament, IDUMÆA), a word signifying "red." It was, according to Gen. xxv. 29-34, the name given to Esau on account of the *red* pottage supplied to him by his brother Jacob. Hence, the country which Esau afterwards obtained was called the land of Edom, but previously Mount Seir. The ruddy hue of the mountain-range, however, may have had something to do with the naming of the region. E. comprised a strip of country 100 m. long by 20 broad, lying between the s. of Palestine and the gulf of Akabah (an arm of the Red sea). It is a wild, mountainous region, with the desert on the e. and w. of it; but rugged though it looks, it contains rich glens and terraces, where flowers, and shrubs, and trees spring up luxuriantly. Its capital was Bozrah (now Buseirah), in the extreme north; its seaports were Elath and Eziongaber, in the extreme south, at the head of the gulf of Akabah. During the reigns of David and Solomon, E. appears to have been under subjection to the Israelites; but when the kingdom of Israel began to decline, the Edomites repeatedly ravaged the southern borders of Palestine, which circumstance is perhaps the reason why they are so terribly denounced by some of the prophets. At a later period, the term Edom (now giving way to the Greek form Idumæa) designated the region between the gulf of Akabah and the Mediterranean, including a part of the s. of Palestine. The revival of Jewish power under the Maccabean princes once more brought Idumæa under Jewish sway. The people were compelled to conform to the laws and customs of their conquerors, and the country was for the future ruled by Jewish prefects, one of whom, called Antipater, who was born in the country, acquired the friendship of the Roman emperor, and was appointed procurator of all Judea. His son was the famous Herod

the Great, "king of the Jews. In the 7th c. A.D., E. was overrun by the Arabs, and has ever since shared the fortunes of Arabia.

EDRED, d. 955; king of the Anglo-Saxons, son of Edward the Elder, and successor to Edmund I. He was victorious over the invading Danes in Northumbria. His nephew Edwy was his successor.

EDRIOPHTHALMATA (Gr., sessile-eyed), a section of the class of crustaceans, consisting of those *malacostracous* crustaceans which have the eyes sessile—not mounted upon stalks. They also differ from the other malacostraca in having the organs of respiration connected with the organs of locomotion; some of them, which constitute the two orders *amphipoda* and *læmodipoda*, having the respiratory organs connected only with the true or thoracic legs, whilst in the remaining order, *isopoda*, they are connected only with the abdominal or false legs. The E. are generally marine; many of the *amphipoda*, however, are inhabitants of fresh water; some of the *isopoda*—as the armadillo-louse and wood-louse—are terrestrial, but are inhabitants of damp places. Many both of the marine and fresh-water species spend their lives rather among the weeds and decaying matters of the shore than in the water, to consume these being apparently their office in the system of nature; some have organs adapted for leaping and for burrowing in the sand, as the common sandhopper (*talitrus locusta*), one of the *amphipoda*, of which countless myriads are to be seen on all our sandy shores, attracting the admiration of even the most careless; some burrow in more solid substances, as the *limnoria terebrans*, one of the marine *isopoda*, which too frequently effects the destruction of piers, dock-gates, etc., perforating them in every direction. Many of the E. are parasitic, some of them on whales, some even on prawns and other crustaceans. Some of the parasitic E. are destitute both of eyes and antennæ.

EDRISI, ABU ABDALLAH MOHAMMAD BNU ABDALLAH BNU EDRIS, AL-HAMUDI, SHERIF, also called AL EDRISI, AL-SIKILI (SICILIAN), or AL-RODJARI (ROGER's), one of the most eminent Arabic geographers, and a descendant of the royal family of the Edrisites—who traced their origin to Mohammed himself—was b. at Ceuta or Sibta (Civitas) in the year 1099. He studied at Cordova, and early distinguished himself by the extraordinary range and versatility of his talents. He excelled in nearly all the then known branches of science and art; but it was geography which at a very early age seems more than any other science to have attracted him. Having completed his studies, he traveled and visited Constantinople, Asia Minor, Egypt, Morocco, Andalusia, and the coasts of France and England. Roger II., king of Sicily, invited him, on his return, to his court, and lavished upon him all the honors which it was in his power to bestow. A favorite wish of this monarch—one of the most refined and liberal-minded men of his age—had long been to have a representation of the earth, founded on the most recent observations. He accordingly invited travelers from all parts of the world to assist him by sending their itineraries, their measurements of longitudes and latitudes, their observations and adventures—in short, all they had seen or heard on their journeys. The collection of this material occupied 15 years, at the end of which it was handed over to Edrisi. Thus guided, he drew up a map, on a globe of pure silver, weighing 450 Roman pounds (50,400 drachmas), in which the whole of the then known world was represented. He, like Ptolemy, divided it into seven climates, beginning at the equinoctial line and continuing northwards to the limits of extreme cold, and intersected each of these with eleven "regions," represented by perpendicular lines, without any regard to the political or physical features of the respective countries. In explanation of this map, he wrote a book (1153), *Nuzhat al-Moshtak*, etc., in which a full account is given of the towns, mountains, rivers, etc., proceeding from w. to e., according to the order of the climates. Careful as he was in observing and collecting, he could not, in the then state of society and communication, but fall occasionally into serious blunders; but on the whole his statements are peculiarly trustworthy; and being the clearest and most reliable exposition of the state of geographical knowledge in those days, the book remained the great and sole authority down to the time of the Portuguese discoveries. An extract of it was first edited at Rome in 1592, in Arabic, entitled *Nubian Geography*, and reprinted in the monastery of Khesruan, in the Lebanon, with Syriac characters, in 1597—both editions incorrect in the highest degree. The very title was a mistake, the editors having, by a misinterpretation of a passage, been led to believe that E. was a Nubian. Bernardino Baldi translated this extract into Italian in 1600, but his translation was never published. The first published translation was a Latin one, made in Paris (1619) by Gabriel Sionita and Johannes Esronita, a work teeming with the most absurd blunders; and Domenico Macri translated this Latin translation into Italian. Rosario Gregorio's Latin version of the portion referring to Sicily was published with the text in a collection of Tardia in 1790. Portions of the Arabic text, with comments, have been separately published; the chapters relating to Africa and to Spain by Hartmann (Göttingen, 1796); those concerning Syria by Rosenmüller (1828); and those on Africa and Spain again by Dozy and Goeje (Leyden, 1866.) The translation of E.'s whole work, in French, was made from two MSS. in the imperial library, by Jaubert, and published (Paris, 1830 and 1840), but it is, unfortunately, not sufficiently faithful. The full text has never been edited.

We shall only add that the incidents of E.'s life have given rise to interminable dis-

cussions. The year and place of his death, as also his creed, whether Mohammedan or Christian, still remain vexed questions.

EDSON, CYRUS, bacteriologist, b. Albany, N. Y., in 1857; graduated at the New York college of physicians and surgeons in 1881; became chief inspector of adulterated foods and offensive trades of the New York board of health in 1886, chief inspector of contagious diseases in 1887, sanitary superintendent in 1891, and health commissioner in 1895, and resigned in 1895. He gained wide repute for original researches in the lines of tubercular and diphtheritic diseases.

EDUCATION. *Educatio*, the Latin word from which our word education is derived, is used by Cicero to represent the earth as the *educator* and nourisher of all things. Tacitus uses *educare* to mean the nursing of infancy, but he limits the use of *educatio* to training. Quintilian, the ablest educational author among the Latins, and who was very precise in the use of words, applies *educatio* to preparatory instruction, but uses *institutio* to represent what we call academic instruction.

Among modern conceptions, that which was embodied in the ideal of the founders of the Prussian national system has been the most popular among recent writers, and perhaps the least satisfactory. By them education is stated to be, "the harmonious and equable evolution of the human powers." (See Bain's *Education as a Science*.) All correct definitions of training must refer to Plato, who said, "Good education is that which gives to the body and to the soul all the perfection of which they are capable." All conceptions of education must of necessity be colored by the philosophical views of the persons holding them, and also by the national ideal of what school work is to accomplish. Among eminent theorizers we have Pythagoras, Plato, Aristotle, Cicero, Quintilian, Abelard, Ratich, Comenius, Locke, Milton, Rousseau, Rabelais, Pestalozzi, Froebel, and Spencer. Each of these eminent scholars has held distinct views as to the aims, possibilities, and practical ideals of human training. But each of these views, although to some extent practical, were mainly theoretical conceptions of what education ought to accomplish under the most favorable circumstances. In the progress of human thought the *practical* ideal has been gaining in general popularity, and yet in Sparta there was a system of training that proposed to take away every force except that which would render the child of the greatest possible use to the state. In Rome, the dominant idea was *potestas*—power, glory, magnificence—but not the training of the masses so that each individual in the state could reach the highest development his nature was capable of, but the ability to command others and surround himself with a retinue of servants, an army of followers, and the power of commanding the obsequious homage of all with whom he might come in contact. During the middle ages the practical ideal was largely lost sight of, but since the Renaissance, and especially since the thoughts of Lord Bacon have influenced the popular mind, the practical ideal has been growing in power until, to-day, the average father has no thought that the school training of his son has any value unless it fits him to do something, in other words, to help him make a living. So it is that we have a multitude of trade, music, drawing, and business schools. Directly opposed to the practical is the *dogmatic* ideal. According to this, an education consists in mastering the technicalities of a course of study, in getting good marks, and graduating with honor. There have been traces of this ideal all down the ages; especially has it been powerful in shaping the educational practices of the Chinese, when little attention is given to the thought of the author studied, but the effort is devoted toward the memorizing of his words.

The first European in modern times who mapped out a formal course of study that should be followed by all students desiring to receive the best education was John Sturm. His intimate friend, Roger Ascham, the tutor of Mary, queen of Scots, and Elizabeth, advocated his ideas with such vigor and success that the great English public schools adopted, in the main, his methods, and until the time of Thomas Arnold followed with little variation his directions. This dogmatic ideal took so strong hold upon the minds of educators that it kept our great preparatory schools and colleges in bondage to a fixed curriculum, from which it was considered improper to depart.

In Sturm's course of study Latin and Greek held the prominent place, and so strenuous have teachers been in following, without proper variation, this ideal, that it was difficult to introduce mathematics and the sciences into the English public schools, and until within a few years no New England college required an examination in English as a requisite for admission to the freshman class. A notable application of this dogmatic thought has been made in arranging public school courses of study, and so strict have some superintendents been in requiring that all teachers of a certain grade should do certain prescribed work at exactly the same time, and in the same way, that one supervisor boasted that he knew what each teacher in his employ was doing at a certain hour and minute. With the progress of correct educational thought in the past few years this dogmatic idea has lost much of its power, and more freedom is given to individual teachers in training the pupils under their care for complete living. This change has taken place through the influence of educational reformers, whose works will be briefly referred to in another part of this article. No sketch of educational work would be complete without reference to the doctrines taught by Christ, and the practices of the Christian church. These doctrines may be divided into two parts, spiritual and practical. In conducting the education of a child the Christian teacher assumes that nothing but a union of the soul with Christ will suffice to drive out the presence of sin, and

fortify the life against its attacks. In practical duties self-abnegation is the end to be reached. This ideal is contained in the golden rule. During the Christian centuries the world has been powerfully influenced by these two doctrines.

The theocratic idea of education held by the Hebrews has been more faithfully followed by the Semitic race than any other conception. The Jews believed that they were the chosen people of God, and from their earliest childhood they were looked upon as religious beings, and for hundreds of years the elders and fathers were the teachers of the people. The children were required to learn the laws of God, to write them on leaves, on sand, and, in later times, on vellum. This learning by heart of select portions of Scripture, and a simple notation by the letters of the alphabet used as figures, constituted all of their elementary education. One characteristic of Hebrew education was its industrial system—all children, of high and low birth, were obliged to learn a trade. Thus, Christ was a carpenter, Paul a tent-maker. Rabbi Judah said that "he who teacheth not his son a trade does as if he taught him to be a thief"; and Rabbi Gamaliel said, "he who hath a trade in hand is like a vineyard that is fenced."

No system of ancient education is more directly connected with us, and can with more profit be studied by modern students, than the Athenian. Its very essence is expressed by Aristotle in his "Politics" when he asks, "Is education to be chiefly directed to things of common and vulgar use, subservient to bodily accommodation and productive of external prosperity; or ought its main business to consist in the sharpening, fortifying, and ennobling the mind?" Elementary education was comprehended under four divisions, grammar, gymnastic, music, and drawing. Under grammar was included writing, the elements of calculation, and composition; under gymnastic, the training of the body in strength and endurance. Music was intended not only as a pastime, but for the purpose of giving harmony and beauty to the body and soul. Under drawing was comprehended geometry and the arts of design, as painting and sculpture. There were, in Athens, and in other Greek cities, schools for the instruction of children. In some of these the teachers were paid by the state, although this was not general. They were recognized by Solon, who provided against abuses in them detrimental to children. The gymnasia were established for the special training of the body, and were intended to promote the equable development of all of its parts. This education commenced about the fourteenth year, when systematic attention was given to the practice of athletics. So much can be said concerning Greek education that it is difficult to decide what to omit. The student of modern education will find a mine of wealth in the methods of Greek culture, from which may be obtained principles and practices of inestimable value to the teacher in this busy age. It is through a careful study of the forces that have both promoted and retarded the progress of the human race that eminent thinkers of modern times have been enabled somewhat clearly to ascertain the true object of teaching.

Probably the most comprehensive idea of what correct education should do was expressed by Bishop Temple, who said that, "It is the power whereby the present ever gathers into itself the results of the past, and transforms the human race into a colossal man whose life reaches from the creation to the Day of Judgment. The successive generations of men are days in this man's life. The discovery of inventions which characterized the different epochs of the world's history are his works. The creeds and doctrines, the opinions and principles of the successive ages are his thoughts. The state of society at different times form his manners. He grows in knowledge, in self-control, in visible size, just as we do, and his education is in the same way, and for the same reason, precisely similar to ours." Pascal expressed the same thought when he said, "The entire succession of man through the whole course of ages must be regarded as one man, always living and incessantly learning."

These broad conceptions of educational processes are essentially modern, and the more they take possession of the minds of the people, the more and more will it be realized that education does not consist in following dogmatic courses of study, memorizing little understood statements, or mastering set tasks, but rather the joyous and free exercise of all the human powers in the search for truth.

A brief review of educational progress, especially in this country, will be necessary in order to know what advancement has been made, and what are the special needs of our times. At the Revival of Learning scholars all at once woke up to the realization of the fact that a mine of literary wealth had been lying just within easy reach, but of which, for hundreds of years, they had been ignorant. The thought of the world was quickened into intense activity. Convents were searched, and libraries of monasteries ransacked for lost manuscripts of classical works. The search was rewarded with wonderful success. Aristotle and Plato were re-translated from the original Greek, and new editions of Latin authors appeared with marvelous rapidity. The new art of printing, which reached a great degree of perfection early in the sixteenth century, greatly aided the dissemination of this new knowledge. The old world, that seemed to have been asleep for five hundred years, opened its eyes in amazement and joy upon a new literature, and so, new thought. The works of the ancients were almost worshipped, and he who could write and speak, with ease and fluency, Ciceronian Latin was considered among the greatest scholars of his time. Ecclesiastics became accomplished classicists, cathedral schools were opened everywhere, especially for the study of Latin. At the opening of the sixteenth century Europe had fairly inaugurated a new

educational era. Just at this time the age of discovery and maritime adventure began—the New World had been found—but this was only the commencement of far more dangerous voyages, and far more exciting adventures than Columbus ever experienced. Books containing a little truth, with a good deal of fiction, and illustrated in the most sensational manner, were published in many countries of Europe. At the beginning of the seventeenth century schools were founded everywhere, and no order was more active in accomplishing this work than the Jesuits. So popular did their schools become that many Protestant parents intrusted their children to them for instruction. In Germany princes as well as educators exerted themselves to improve and multiply their schools. Before this time John Sturm had established a gymnasium in Strasburg, where he taught forty-five years, and was greatly influential in fixing methods of instruction in all of Europe.

Whether the Jesuits did more than Sturm to establish the methods of classical teaching is a disputed question, but Sturm said, "I have observed what writers the Jesuits explain, and what method they follow, and it differs so little from ours that it seems as if they had drank from our fountain." Yet it is evident, as Von Raumer has said, that "Protestants and Catholics sought the same object in their efforts for literary culture." The ideal was Ciceronian Latin eloquence. It was, in fact, a pure philological training in which almost everything else was lost sight of except that speaking and writing, French, German, and English were not valued as literary languages, and Latin became the means of communication between all who laid any claim to having a liberal education.

Among those who attempted to reform these systems of teaching were first, Wolfgang Ratich, and after him Johann Amos Comenius. Both of these men devoted their lives to the advocacy of their ideas—Ratich with moderate, and Comenius with a great degree of success. It was urged by them and their followers that the common method of instruction of their time was "a blind groping, without road or object." They declared that words were put too soon in the mouths of scholars; that they were required to name and describe things strange to them, and so, many school exercises were "empty talking without any real substance." They insisted that all pupils, even the youngest, should understand what they were required to say and do, and should be able to give a clear account of their thoughts, in correct words and sentences made by themselves. Ratich urged the necessity of first reading and speaking the mother tongue correctly and fluently. Hebrew, Greek, and Latin should be studied in the order named, but the German language should be the medium of communication in all German schools. He divided his school into six classes, in the three lowest of which the mother tongue was solely used. In the fourth Latin was commenced, and in the sixth, Greek. The teachers of the lowest classes need know no language but German, but he "should form the tongues and languages of the new scholars according to pure Misnian dialect, by daily prayer, short Bible texts, and questions in the form of ordinary conversation."

The favorite maxim of Ratich and his followers, "*Per inductionem et experimentum omnia*," was purely Baconian, and shows that the spirit of this philosopher influenced, at least to some extent, this educational reformer. Comenius was a man of greater breadth and scholarship than Ratich. He wrote several valuable books, one of which, the "*Opera Didactica*," filled more than a thousand folio pages, and is "a most rich treasure of acute and profound thoughts." But the book that gave Comenius his greatest fame was his "*Orbis Pictus*," which appeared in 1657, and was for a hundred and fifty years the most popular text-book of the world. It was a principle of Comenius that teaching should begin with the presentation of actual things. In the *Orbis Pictus* everything was illustrated by pictures—the book is full of figures and cuts, "by the help of which the attention will be awakened and the imagination pleased." This was the forerunner of the thousands of illustrated school-books which have appeared, but among all that have followed not one has been more minutely or profusely illustrated than this. Comenius must be considered the first learned educational reformer of recent centuries, and the time will never come when his opinions will not be quoted with respect.

Except the writings of Comenius, no book has made a more decided impression upon the educational world than Jean Jacques Rousseau's *Emile*. Its plan of instruction is to allow the youthful mind to unfold without restraint. Necessity alone is to regulate the education of a child until reason is strong enough to be its guide.

The reading of the *Emile* by J. Heinrich Pestalozzi was the means of leading him to devote his life to the practice of education. Like Rousseau, his principles were founded entirely upon the following of nature. It took him a long time to find the means of reaching the best results, but in the end his method was so clearly shown that no teacher who desires to follow him need be at a loss to know what to do. No modern educational reformer has exerted so strong an influence in taking unreasonable and unnatural practices out of the schools, and introducing in them the correct order in developing a human being. The name of Pestalozzi is deservedly held in high esteem by all students of modern educational science.

From Comenius to the United States is but a single step, for he was invited to become president of Harvard college. Fifteen years after the landing of the Pilgrims public schools were established in Massachusetts, and all children were obliged to attend them. A fine of \$50 was imposed upon the parent for failure in doing his duty. Tuition was

required of all who were able to pay it. In 1683, every town of 500 inhabitants in Massachusetts was obliged to maintain a grammar school in addition to the primary school, and those towns failing to do so were taxed and the proceeds given to the next adjoining town. In 1636 the legislature of Massachusetts voted £400 toward the founding of a college. It was named in honor of Rev. John Harvard, who left £700 in 1638, and a library of 300 volumes to the new institution. The Dutch settlers on Manhattan Island established a school in 1633; others followed, which were supported by the town and the church. When the English took possession of the island, in 1674, every town and village in the colony had a public school, in which tuition was given to all unable to pay. Few public schools were found west and south of New York before the commencement of the present century, although higher instruction was encouraged, and the charter of the college of William and Mary, in Virginia, was granted in 1688. It provided for a college president and six masters, who were to give instruction in all the branches of a liberal education. This institution continued in active existence until the outbreak of the civil war. In 1746 the colonial legislature of New York authorized the raising of money by a lottery for the establishment of a college, the proceeds of which were devoted to the founding of King's college, now Columbia. The western states learned wisdom from the experience of the old colonies, for the ordinance of 1787, organizing the Northwestern Territory, provided that "religion, morality, and knowledge being necessary to good government and to the happiness of mankind, schools and the means of education shall be forever encouraged." Public lands were designated for the support of schools, and each of the new states levied taxes for their maintenance. The school system of New York must always look to Governor Clinton as its father, for on his recommendation, in 1795, "the sum of \$50,000 was appropriated for five years for the support of common schools. This has increased from year to year, until in 1890 the sum raised in the state of New York by direct taxation for the support of schools amounted to \$3,600,000. In all the states of the Union the educational tax has so increased that the income from this source, according to the commissioner of education, amounted, in 1890, to the enormous sum of \$132,000,000.

Public schools that fifty years ago charged tuition to those able to pay, are now entirely free to all of school age, and in many cities text-books and other necessary appliances are furnished. There were no active efforts in this country to promote a generous, free, public education until near the close of the last century. Bronson Alcott, the well-known author, born in Massachusetts in 1799, speaking of schools in the early part of the present century, said that, "until within a few years no studies have been permitted in the day school but spelling, reading, and writing. Arithmetic was taught by a few instructors one or two evenings a week." Slates were unknown for school use until after the Revolutionary war, and blackboards have been common only during the past fifty years. The Rev. William Woodbridge, a successful teacher in the early part of this century, said that in Connecticut in his younger days he has known boys who could do something in the first four rules of arithmetic, but girls were never taught it. When the republic was established the people began to realize that without universal intelligence the union of the states could not be permanent. School funds were created in all the New England states, but owing to a lack of unity of action, the progress was not so rapid in New York, and the states west and south. As late as 1865 rate bills were in use in New Jersey, New York, Rhode Island, Michigan, and Connecticut. But it is now generally admitted that the giving of an elementary education to each child in the country, both rich and poor, is a debt the state owes and must pay. In many of the states the whole work of conducting the schools is given into the hands of either a board of education, or a superintendent of public instruction, who reports to the legislature at its meetings. In the city of New York the Public School Society was established in 1805, and had charge of all public instruction in the city. Its first president was De Witt Clinton, and it continued to provide public instruction until 1853, when it voluntarily turned over to the city its entire system of schools and property to the amount of \$600,000. George Clinton laid the foundation of the common school system of New York, and, in fact, of the whole country, in 1797, and De Witt Clinton crowned a long life of honor and usefulness by requiring the state to give to every child within its borders the means of getting an elementary English education, free of all expense. Strong efforts have been recently put forth to make all education, both higher and lower, free. By a vote of the people of New York a free academy for boys was established in 1847. This has become the College of the City of New York, for the support of which the city annually appropriates the sum of \$150,000. The Female Normal School, now the Normal College, was founded in 1870, and receives an annual support from public funds to the amount of \$125,000. Public high schools, giving the elements of a liberal education, have been established in most of the cities and larger towns in the Union, and in many instances the buildings in which these schools assemble are among the best constructed and most thoroughly equipped public edifices in the country. State universities, supported by public funds, and largely attended by both young men and women, have been founded by nearly all the states, and in some instances, as Ann Arbor, in Michigan, and Cornell, in New York, they have become institutions of great effectiveness. The establishment and permanence of these colleges have been greatly promoted by the aid they have received through grants of public lands from the general

government. Independent and denominational colleges have increased to such a degree that each leading denomination has one and sometimes three colleges in each state.

Although the first normal school of which we have any mention was established in Rheims, France, in 1681, by the Christian Brothers, yet it was not until 1840 that the first building was erected in this country for a public normal school, and dedicated, at Bridgewater, Mass. The promoter of this enterprise was the distinguished Horace Mann, the foremost American educator of this century. At the present time every state in the Union has its normal school, and some have several, entirely supported by public funds, in which teachers are trained in the theory, science, and art of their calling. The state of New York has 12 of these schools, supported by annual appropriations amounting in the average to more than \$200,000. The first university to establish pedagogy as a distinct professional department of study, on the same grade as law, medicine, and theology, was the university of the City of New York. Its school of pedagogy was inaugurated with definite courses and degrees in May, 1890. In addition to the many educational forces already mentioned, there are in the United States and Canada a large number of scientific, theological, law, and manual-training schools. Each state has its deaf, dumb, and blind institutions, as well as soldier-orphan, idiot, and reformatory schools. In the different parts of the United States there are about one hundred and fifty periodicals devoted exclusively to the discussion of educational questions. Next to business, religion, and politics, no subject to-day engrosses so much of the thought of the intelligent people of the civilized world as education, and it is safe to predict that the coming generation of boys and girls will get far more good from their school training than has ever been realized during the history of the human race.

The reader is referred to the following standard works: Pestalozzi, *Sämmtliche Schriften*, 5 vols. (1826); Tommaseo, *Sull' Educazione* (1851); Morley, *Defence of Ignorance* (1851); Horace Mann, *Letters and Reports on Education* (1867); Brochard, *History and Progress of Education* (1860); Markby, *Practical Essays on Education* (1868); Mullinger, *The Schools of Charles the Great* (1877); Barnard, *German Educational Reformers* (1878); Jolly, *Education, its Principles and Practice* (1879); Thring, *Education and the School* (1876); Kiddle and Schem, *Cyclopædia of Education* (1877); Kingsley, *Health and Education*, 2d ed. (1887); O. Browning, *Introduction to the History of Educational Theories* (1882); Mahaffy, *Old Greek Education* (1882); Galloway, *Education, Scientific and Technical* (1881); Paulsen, *Geschichte des Gelehrten Unterrichts auf den Deutschen Schulen und Universitäten* (1885); Painter, *History of Education* (1886); Herbert Spencer, *Education, Intellectual, Moral, and Philosophical* (1886); Rousseau, *Emile*, with notes by Jules Steeg (1885); Rosenkranz, *Philosophy of Education* (1886); Bain, *Education as a Science* (1886); Sonnenschein, *A Cyclopædia of Education*, ed. by Fletcher (1889); Rosmini Serbati, *The Ruling Principles of Method Applied to Education*, English translation (1887); Guyau, *Education et Hérité* (1889); Jacobi, *Physiological Notes on Primary Education* (1889); Quick, *Essays on Educational Reformers*, 2d ed. (1890). Also the following articles: ACADEMY; AGRICULTURAL EDUCATION; CHAUTAUQUA; CO-EDUCATION; COLLEGE (and the names of the various colleges); COLLEGES, AMERICAN; COLLEGIATE EDUCATION FOR WOMEN; COMMON SCHOOLS; DEGREE; EVENING SCHOOLS; FROEBEL; GRAMMAR SCHOOLS; GYMNASIA; HAMILTONIAN SYSTEM; INDUSTRIAL SCHOOLS; INFANT SCHOOLS; KINDERGARTEN; MANUAL TRAINING; MILITARY SCHOOLS (and their various names); MONITORIAL SYSTEM; NATIONAL EDUCATION; NAVAL SCHOOLS (and their various names); NORMAL SCHOOLS; PEDAGOGY; PESTALOZZI; POLYTECHNIQUE; REFORMATORY SCHOOLS; SCHOOLS OF LIBRARY ECONOMY; TECHNICAL EDUCATION; TECHNOLOGY; UNIVERSITY (and the names of various universities); UNIVERSITY EXTENSION.

EDUCATION, COMMISSIONER OF, the chief officer of the bureau of education, at Washington. He is appointed by the president and senate, and his duties are "to collect such statistics and facts as shall show the condition and progress of education in the several states and territories;" to diffuse such "information respecting the organization and management of schools and school systems and methods of teaching as shall aid the people in the maintenance of efficient school systems, and otherwise promote the cause of education;" and also "to present annually to congress a report embodying the result of his investigations and labors, together with a statement of such facts and recommendations as will, in his judgment, subserve the purpose for which the department is established." The office was established in March, 1867.

EDUCATION, MILITARY. See UNITED STATES MILITARY ACADEMY.

EDUCT is a term employed in chemistry to indicate that the body to which it is applied is separated by the decomposition of another in which it previously existed as such. It thus stands in opposition to *product*, which denotes a compound not previously existing, but formed during decomposition. Thus, the volatile oils which pre-exist in cells in the fruit and other parts of plants, and oil of sweet almonds obtained by pressure, are educts; while oil of bitter almonds is a product.

EDWARD, or **EADWARD**, I. (THE ELDER), d. 925; king of the Anglo-Saxons, eldest son of Alfred, succeeded his father in Oct., 901, when about 30 years of age, having previously distinguished himself by defeating the Danes. His cousin Ethelwald, who disputed Edward's right of succession, and endeavored to obtain the throne, was killed in battle. The reign of Edward was turbulent, but at length he subdued the Danes.

EDWARD, or **EADWARD**, II. (THE MARTYR), d. 978; king of the Anglo-Saxons, succeeded his father Edgar in 975 A.D., at the age of 13. His succession was contested

in behalf of his younger brother, only 7 years old; but the powerful influence of St. Dunstan secured Edward's triumph. He died by treachery. Returning exhausted from the chase he was lured to the residence of Elfrida (the mother of the contesting prince) and there stabbed in the back.

EDWARD THE CONFESSOR, king of the Anglo-Saxons, was b. at Islip, in Oxfordshire, about the year 1004. On the death of his father, Ethelred, in 1016, Canute the Dane obtained possession of the throne, and in the following year married Emma, the mother of Edward, by whom he had two sons, Harold and Hardicanute. Until the death of Canute in 1035, E. lived in Normandy; he then made an ineffectual attempt to establish his authority in England; but his mother Emma had now transferred her affections to her younger children; and she exerted all her influence and energy in favor of Hardicanute, who, on the death of his brother Harold in 1040, became sole ruler of the Anglo-Saxon kingdom. Hardicanute, however, was generous enough to invite his half-brother to England, whither accordingly E. went, and was honorably received. On the death of Hardicanute in 1042, E. was declared king. The person chiefly instrumental in bringing about this result was earl Godwin, whose only daughter, Editha, was married to the king in 1044. The lady only became his queen, not the partner of his bed. For this unusual exhibition of asceticism, the honor of canonization, and the title of Confessor, were conferred on him, about 100 years after his death, by Pope Alexander III. His first act after his accession was to deprive his mother of all her treasures—taking even the cattle and corn from her fields, and, according to some accounts, endeavoring to compass her death. The whole of E.'s reign is simply the record of the growth and struggles of the Norman or court party with the national or Anglo-Saxon party; for an account of which see articles **GODWIN** and **HAROLD**. E.'s wars with the Welsh in 1057 and 1063, and with the Northumbrians in 1065, were short and successful. He died 5th Jan., 1066. See Green's *History of the English People* (1877-80), vol. I.

EDWARD, the **BLACK PRINCE** (See **EDWARD III.**), 1330-76; son of Edward III. of England, and Philippa. He was created duke of Cornwall in his eighth year, and a year later, during his father's absence in France, was appointed nominal guardian of the kingdom. He held this office also in 1340 and 1342; and was created prince of Wales on the king's return in 1343. Three years later he accompanied his father to France, and in the battle of Crécy led the most victorious division of the army. He also shared his father's glory in the victory over the Spanish fleet at the battle of L'Espagnols-sur-Mer. In 1355, he was given command of the chief army in the French war, landed at Bordeaux, and after several smaller successes, in 1356 he gained the victory of Poitiers, capturing the French king, whom he carried captive to London in 1357. In 1361, during the short peace following king John's ransom, he married his cousin Joanna, the "fair maid of Kent," of whom he was the third husband, and being created duke of Aquitaine, crossed over to his new dukedom, where he ruled successfully and peacefully for a time. Making an entangling alliance with Pedro, the deposed king of Castile and Leon, although victorious he found himself burdened with the expenses and losses of a profitless war, and for the excessive taxes laid upon his duchy he was summoned to account at Paris. To this summons he replied haughtily that he would come "helm on head, and with 60,000 men." This led to a rupture between France and England. The French planned a double invasion of English territory. The duke of Anjou, commanding one expedition, besieged Limoges, which had been ceded to the English by the treaty of Bretigny and formed part of the principality of Aquitaine. The city surrendered by the treachery of its bishop. The Black Prince, enraged by this act, after a siege of a month, recaptured the city by assault, and put to the sword 3,000 of its inhabitants. This madness of cruelty is the chief blot on the fame of the prince. It is only partially explained by his disordered health, which itself was perhaps due to the irritation of seeing the English power waning in France, in spite of all his victories. He was compelled, by the advice of his physicians, to return to England the following year, 1371, where he lingered in continually failing health for five years. In these years he saw the loss of Aquitaine to England, but he did good service to the country in opposing the corrupt and oppressive influences which surrounded the king, and by his help parliament was able to pass acts against the king's mistress, Alice Ferrers, and in restraint of the dangerous ambition of John duke of Lancaster.

EDWARD I., King of England, was the eldest son of Henry III. by his wife Eleanor, daughter of Raymond, count of Provence, and was b. at Westminster, June 16, 1239. That union of valor and intelligence which characterized him was exhibited at an early period. At the commencement of the struggle between Henry and his barons, prince E., who was then governor of the duchy of Guienne, came over to England, and boldly declared his dissatisfaction with his father's conduct. Subsequently, he took the king's side in the war, and by his vigorous generalship put an end to the insurrection in a few years, but there is no evidence to show that he had changed his opinion of Henry's policy; and it is remarkable that he himself, during the whole of his reign, carefully avoided coming into collision with his nobles. When the last of the crusades was organized, at the instigation of Pope Gregory X., Prince E. arranged with Louis, king of France, to take part in it. Louis died before reaching Palestine, but the former landed

at Acre in 1271. Nothing, however, of any consequence was achieved; and in the following year he set out on his return to England. At Messina, he heard of his father's death, whereupon he proceeded to France, and did homage to Philippe III. for his French possessions, arriving in England 25th July, 1274. He and his queen, Eleanor, were crowned at Westminster on the 19th of Aug. following. His first military expedition, after his accession to the throne, was directed against the Welsh. After a contest of nearly 10 years—in the course of which the famous prince Llewellyn was slain at Llanfair, 11th Dec., 1282—Wales was finally subdued and incorporated with England. His next ambition was to possess himself of Scotland. The death, in 1290, of Margaret, granddaughter of Alexander III., and known as the maiden of Norway, who was to have been married to E.'s son, seemed to have frustrated his design; but the selfishness of the 10 competitors for the Scottish crown who now appeared, induced them to acknowledge E. as *Lord Paramount* of Scotland, each hoping that he would thereby secure the English monarch's support. The competitors were also foolish enough to make him umpire among them, or perhaps it would be more correct to say, they were not powerful enough to refuse his arbitration. Be that as it may, E. decided in favor of John Baliol at Berwick, 17th Nov., 1292; and Baliol immediately took the oath of fealty to him; and on the 26th of Dec. did homage to the English king for his crown at Newcastle. The patriotism and pride of the Scottish nation took fire at such humiliation, and in a short time Baliol was hurried by his subjects into a war with England. In 1296, E. entered Scotland, devastating it with fire and sword. He penetrated as far as Elgin, compelled Baliol to resign the kingdom, and governed the country by means of his own officers. It was during this expedition that he carried off from the cathedral of Scone the celebrated stone on which the kings of Scotland used to be crowned, and which is now in Westminster abbey. A second rising took place in Scotland in the following summer. The leader on this occasion was William Wallace (q. v.), whom tradition represents as the most heroic and unselfish of patriots. He was completely successful for a time, chiefly it is to be supposed on account of the absence of Edward. In the spring of 1298, however, that sovereign again made his appearance in Scotland, and gave battle to Wallace at Falkirk, on the 22d of July. Partly through treachery, and partly, no doubt, through the superior generalship of E., who is considered to have been the first military commander of his time in Europe, the Scottish forces were entirely defeated. The next five years were spent by the English king in reducing the country to obedience—with very imperfect success, however. In the summer of 1303, he led a third large army into Scotland, and once more spread havoc and ruin to the shores of the Moray firth. The last castle that held out against him was Stirling, which did not yield till the 20th of July, 1304. E. wintered at Dunfermline. Some time after this, Wallace either fell into his hands, or was betrayed, and on the 23d Aug., 1305, was hanged, drawn, and quartered as a traitor, at Smithfield, in London. E. now probably thought that he had no further danger to dread from Scotland, but if so, he was quickly undeceived. Robert Bruce, earl of Carrick, grandson of the chief rival of Baliol, suddenly left the English court, where he had been residing, in the beginning of 1306, unfurled once more the banner of Scottish independence, and on the 27th Mar. of that year was crowned at Scone. An English army, under the earl of Pembroke, was immediately despatched to Scotland; and at the close of the year, the king himself set out to chastise Bruce. But worn with the "sturt and strife" of many years, the cares of his own kingdom, and the anxieties of conquest, E. only lived to reach Burgh-on-Sands, a village beyond Carlisle, where he expired, 6th July, 1307, "in sight of that country," says lord Hailes, "which he had devoted to destruction."

E. possessed most of the qualities that go to form a great ruler: valor, prudence, inexhaustible energy, and pertinacity are visible in his whole career. He was ambitious, it is true, but in his age, ambition was looked upon as a virtue rather than as a crime; it was the natural accompaniment of kingly courage. His relations to Scotland were also unfortunate. Few people of any understanding, however, now doubt that the best thing possible for that country would have been a peaceful union with England, for at that time there was no hatred or jealousy between the two nations. The death of the maiden of Norway destroyed every chance of such a union, and the great mistake committed by E. was his endeavoring to bring about by force what could prove beneficial only when it was the result of voluntary agreement. The effect of his mad endeavor was to plant in the breasts of the two nations the *germs* of a hitherto unknown hostility, which, in subsequent generations, worked incalculable mischief, and the traces of which have not wholly disappeared even at the present day. As a civil ruler, E. is entitled to the highest praise. Immense progress was made during his reign in the establishment and improvement of law and order throughout the land, the reformation of civil abuses, and the restriction of ecclesiastical jurisdiction and encroachments. He has been called the English Justinian; and both Hale and Blackstone affirm, that "the very scheme and model of the administration of common justice between man and man was entirely settled by this king." Ireland and Wales participated in the benefits of English law. It was during E.'s reign, too, that the representation of the commons of England first became regular; but probably the greatest advantage obtained by the nation, was the declaration that the right or privilege of levying taxes resided in the parliament. In general, it may be said that E. ruled in

harmony with the ideas and desires of the best heads among his nobles and burgesses; and though touchy on the question of his prerogative, like every Plantagenet, and very cruel in his treatment of the Jews, he must be regarded, on the whole, as one of the most enlightened, liberal, and sagacious monarchs of his age.

EDWARD II., son of the preceding, was b. at Caernarvon, in Wales, 25th April, 1284, and in 1301, was created prince of Wales, being the first heir-apparent of the English throne who bore that title. He accompanied his father on his various expeditions into Scotland, and on the death of the latter at Burgh-on-Sands, he led the English army as far n. as Cumnock, in Ayrshire, after which he returned to his own country. At home, E.'s conduct was contemptible. While still a youth, he had conceived an extraordinary admiration and fondness for a witty, clever, but dissolute creature called Piers Gaveston, the son of a Gascon knight. After he became king, there was no limit to the honors heaped on the favorite. When he went to France, in the beginning of 1308, to conclude a marriage with Isabella, daughter of Philippe V., king of France, Gaveston was left guardian of the kingdom. The nobles were indignant, and demanded his banishment. Twice was Gaveston forced to leave England, but as often was he recalled by the weak monarch, whose love for him was sheer infatuation. At last the nobles rose in arms, besieged Gaveston in Scarborough castle, and having forced him to surrender, hanged him at Warwick, 19th June, 1312. Two years after this, E. invaded Scotland at the head of the greatest army ever collected in England—amounting, according to some historians, to 100,000 men. At Bannockburn, on the 24th June, 1314, he was encountered by Robert Bruce (q.v.), and defeated with immense slaughter. This victory put Scotland and England on equal terms for all time coming, and made the notion of a military subjugation of the former country by the latter be given up. Finally, in 1319, after numerous petty successes on the part of the Scotch, E. concluded a truce with them for two years. He now exhibited again his imbecile passion for favorites. The person selected on this occasion was Hugh le Despencer. Once more the nobles rebelled, and both Hugh le Despencer and his father were banished in July, 1321, but some months after, were recalled by E., and many of the nobles, among others, the earl of Lancaster, were beheaded in the following year. Immediately after, E. invaded Scotland for the last time, and penetrated as far as Culross, in Fife; but having achieved no particular success, he concluded a truce with that nation for thirteen years, and returned to England. A dispute now arose between him and Charles IV. of France, brother of his wife Isabella, in regard to the territories which he held in that country. Charles seized them, whereupon E. sent over Isabella to remonstrate, and, if possible, to effect an amicable arrangement between them. Isabella, it would appear, despised her husband, and disliked the Despenchers. Meeting at the French court many English nobles who, entertaining similar feelings, had left their country to avoid the enmity of the favorites, she was easily induced to make common cause with them against her husband and the Despenchers. At the same time, she formed a connection of a criminal kind with Roger de Mortimer, one of the most powerful of the exiles. This of course more thoroughly involved her in the plot against Edward; and having obtained possession of the young prince of Wales, afterwards Edward III., she embarked from Dort, in Holland, with a large body of malcontents, and landed at Orwell in Suffolk, 22d Sept., 1326. The queen and the banished nobles were soon joined by all the influential persons in England. E. fled, but was taken prisoner at Neath abbey, in Glamorganshire; the Despenchers, father and son, were executed; and the monarch himself, after being formally deposed, 25th Jan., 1327, was murdered in Berkeley castle, 20th Sept. of the same year. He left two sons and two daughters.

EDWARD III., son of the preceding, was b. at Windsor, 13th Nov., 1312, and ascended the throne, 25th Jan., 1327. During his minority, the country was governed nominally by a council of twelve nobles and bishops, but really by Mortimer and his paramour Isabella. On the 24th Jan., 1328, the young king married Philippa, daughter of the earl of Hainault; and two years after, resolving to take the power into his own hands, he seized Mortimer, and put him to death, 29th Nov., 1330, and banished his mother, Isabella, to her house at Risings (where she lived for twenty-seven years). He next invaded Scotland, to assist Edward Baliol, son of John Baliol, who, in the confusion that ensued on the death of the great Bruce, had made a descent on the country, and got himself crowned at Scone. A bloody battle was fought at Halidon hill, near Berwick, 19th July, 1333, in which the Scots were completely defeated. Baliol now assumed the authority of a king, and did homage to E. for his possessions, the result of which act was, that he had to flee the kingdom in a few months, for the thing most intolerable to the Scottish spirit was that any monarch should dare, or fancy he had a right, to surrender the independence of his country. In the course of three years, E. thrice invaded Scotland; but though he frightfully wasted the country, and brought armies with him such as could not be successfully opposed, he could not break the invincible spirit of the people, who, after each invasion had rolled over them like a flood, rose and rallied with a still more stubborn and impassioned resolution to be free. But the scene of E.'s great exploits was France. Charles IV. having died without a son, Philippe of Valois, the nearest heir by the male line, ascended the throne, under the title of Philippe VI. E. claimed the

crown in right of his mother Isabella, sister of Charles; but as the law of France expressly excluded females from enjoying sovereign rights, it is manifest that E.'s claim was utterly groundless. The English king admitted that his mother, being a female, could not inherit the crown of France, but affirmed that he, as her *son*, might. But it is clear that he could not receive from his mother rights to which she herself had no claim. Yet never was a bad cause ennobled with more splendid triumphs. E. declared war against Philippe in 1337. His first campaign was not very remarkable; but in 1346, accompanied by his eldest son, known as the black prince, he again invaded France, conquered a great part of Normandy, marched to the very gates of Paris, and on the 26th Aug., 1346, inflicted a tremendous defeat on the French at Crécy (q.v.). Here the black prince, though only sixteen, exhibited the courage and the prowess of a veteran, slaying with his own hand the king of Bohemia, who fought on the side of France. After some further successes, such as the reduction of Calais, a truce was concluded between the two nations for several years. Meanwhile, the Scots had sustained a severe defeat at Neville's Cross, near Durham, their king (David) being taken prisoner. In 1356, the war with France was renewed, and on the 19th Sept. of that year, the black prince obtained a brilliant victory at Poitiers, king John of France (Philippe having been dead for some years) falling into his hands. The Scotch monarch was released for a ransom of £100,000 in 1357, and king John in 1360, when a peace was concluded between the French and the English, by which the latter were to retain their conquests. King John, however, finding it not consistent with the honor or desire of his country that such a peace should be carried out, magnanimously returned to captivity, and died in London, 8th April, 1364. Shortly before this date, David, king of Scotland, whose residence in England had extinguished the little patriotism he ever had, entered into a secret agreement with E., in virtue of which his kingdom—if he died without male issue—was to be handed over to the English sovereign. Meanwhile, the Black Prince, who had married Joanna, daughter of the earl of Kent, had received from his father Aquitaine and Gascony, and ruled there for some time very prosperously; but ultimately involving himself and his father in a war with France, which was disastrous in its issues, he was obliged, in 1374, to conclude a truce for three years. E. waged war no more. In spite of his brilliant victories, in spite of the dazzling valor of his son, he was at the last unsuccessful. Neither in Scotland nor in France did he realize his desires. Affairs at home were no less unsatisfactory in the last years of his life. He quarreled with his parliaments, and the Black Prince led the opposition. The latter, however, died 8th June, 1376, in the 46th year of his age. E. himself expired on the 21st June, 1377, after a reign of 51 years. By his wife, Philippa, he had seven sons and five daughters, several of whom died young. He was succeeded by his grandson Richard, son of the Black Prince, who ascended the throne as Richard II.—The reign of E. was marked by the great progress made in law—a greater number of "important new laws being passed than in all the preceding reigns since the conquest." Among these laws were several indicating the increasing repugnance of Englishmen to ecclesiastical, and especially to papal jurisdiction. Trial by jury also now began to supersede other modes of trial. Justices of peace likewise make their earliest appearance in this reign, and legal proceedings were ordered to be carried on henceforth in English, and not in French. Sir James Mackintosh is of opinion, that though E.'s "victories left few lasting acquisitions, yet they surrounded the name of his country with a luster which produced strength and safety"—an opinion which appears, on the whole, to be well founded. It remains to be said that E.'s reign witnessed the culmination of chivalry, and in the black prince, possessed a splendid example of its virtues and its vices. The fine arts, especially architecture and poetry, also attained a grand development. Chaucer, Gower, and several eminent chroniclers, flourished at this time, and in the sphere of religious reform stands out the noble and thoroughly English figure of Wickliffe.

EDWARD IV., son of Richard duke of York, and great-grandson of Edmund duke of York, who was the 5th son of Edward III., was b. at Rouen, 29th April, 1441 (or, according to another account, in Sept., 1442). His original title was that of earl of March. It would be quite impossible, in the short space at our disposal, to clear our way through the jungle of family relations by which Richard duke of York, the father of Edward IV., traced his right to the throne. Suffice it to say, that in 1460 the bloody struggle between the *Yorkists* (the party headed by Richard duke of York, who at first professed only a desire to remove from the king, Henry VI., his pernicious counselors) and the *Lancastrians* (the party of the sovereign) ceased for a moment. The Yorkists, on the whole, had been victorious on the battle-field, and their leader contrived to induce parliament to appoint him Henry's successor. Shortly after, however, Henry's wife—the brave queen Margaret—raised an army in the n., and on the 31st Dec., 1460, encountered and overthrew York on Wakefield Green, the duke himself being slain. But this reverse was compensated for by the success of his son Edward, who, after routing the royal or Lancastrian forces, under the earls of Pembroke and Ormond, at Mortimer's Cross, near Hereford, marched towards London, which he entered on the 28th Feb., 1461. He immediately presented his claim to the crown to parliament, which admitted its validity, and on the 4th of Mar. ascended the throne as Edward IV., amid the acclamations of the citizens of London, with whom he was a great favorite. For three years

he had to struggle hard to keep his position. His first victory over the Lancastrians was obtained at Towton, in Yorkshire, 29th Mar., 1461, hardly one month after his accession. Finally, in May, 1464, a few days after the victory at Hexham, Henry himself fell into E.'s hands. This closed the war for a time. About this time, E. married Elizabeth Woodville, widow of sir John Grey. This marriage gave great offense to the earl of Warwick, by far the most powerful of E.'s adherents, who was at that time engaged in prosecuting an alliance between E. and the sister-in-law of Louis XI., king of France. In 1469, Warwick openly declared against him, joined queen Margaret, and compelled E. to flee the country. King Henry was released from the Tower, where he had been a prisoner for six years, and once more invested with royal authority. But in the spring of 1471, E. landed at the Humber, proceeded swiftly to London, seized the person of Henry, and was again hailed king by the inhabitants. Warwick now gathered an army, and hurried to encounter him. The two met at Barnet, where Warwick was defeated and slain, April, 1471. In the course of the next month, E. routed the Lancastrians at Tewkesbury, capturing both queen Margaret and her son, prince Edward. The latter was murdered the day after the battle; the queen herself, after an imprisonment of four years, was ransomed by the French monarch. E. died 9th April, 1483, the later years of his reign presenting few political incidents of any moment. E. was an able commander, as his numerous victories show, but he was dissolute in the extreme. It was during his reign that printing was introduced into England, as also silk manufactures. In law, few notable changes occurred, but the practice of indirect pleading dates from this period, which is also illustrated with the names of distinguished legists, such as Littleton and Fortescue.

EDWARD V., son of the preceding, was b. 4th Nov., 1470. The story of his life is brief and tragic. At the death of his father, he was living at Ludlow, in Shropshire, a boy of thirteen. When the news reached Ludlow, earl Rivers, his uncle by the mother's side, set out with him for London. Richard duke of Gloucester, however, contrived to obtain possession of his person at Northampton, and brought him to the capital himself, in the beginning of May, 1483. Towards the end of the same month, Richard was appointed protector of the kingdom. About the middle of June, the young duke of York, brother of Edward V., also fell into his hands. The two hapless boys were then removed to the Tower, and were never more heard of. The general, and in all probability the correct opinion is, that they were murdered by command of Gloucester himself. All attempts to whitewash "the bloody and devouring chief" have signally failed.

EDWARD VI., son of Henry VIII. by his wife Jane Seymour, was b. at Hampton Court, 12th Oct., 1537. The events which happened during his brief reign were of great importance, but they were of course brought about by others, E. being too young (he was not sixteen when he died) to exercise any personal influence on the statesmen or the tendencies of his age. On the death of Henry in 1547, Edward Seymour, earl of Hertford, became protector of the kingdom. He was attached to the principles of the reformation, and during his rule, great strides were made towards the establishment of Protestantism in England. The images were removed from the churches; refractory Roman Catholic bishops were imprisoned; the laity were allowed the cup at the ceremony of the Lord's supper; all ecclesiastical processes were ordered to run in the king's name; Henry's famous six articles (known as the Bloody Statute) were repealed; a new service-book, compiled by Cranmer and Ridley, assisted by eleven other divines, was drawn up, and ordered to be used, and is known as the *First Prayer-Book of Edward VI.* (see COMMON PRAYER BOOK); and the celibacy of the clergy ceased to be obligatory. In war, Seymour showed himself to be a brave general. During the first year of his protectorate, he invaded Scotland, on account of the refusal of the Scottish government to fulfill the contract into which it had entered with Henry VIII., by which it was agreed that Mary queen of Scots should marry Edward. The battle of Pinkie followed, on the 10th Sept., 1547, in which the Scots were completely beaten; and Seymour, now duke of Somerset, might have inflicted most serious damage on the whole country if his presence had not been required at home. He returned to find that his brother, lord Seymour, had been caballing against him. Somerset had him arrested, tried, and condemned for treason, and on the 20th of Mar., 1549, he was beheaded on Tower Hill. In the summer of the same year the protector quelled an insurrection of the populace headed by one Kett, a tanner; but in the course of a few months, a more dangerous adversary appeared in the person of John Dudley, earl of Warwick, whose party, by dint of insinuations against Somerset, excited the nation against him, and at last compelled the king to sign his deposition. On the 14th of Oct., Somerset was placed in the Tower; and on the 1st of Dec., 1551, he was tried before the house of lords for treason, condemned, and executed, 22d of Jan., 1552. The people regretted, with good reason, his death, for Dudley was both a worse and a weaker man than himself. Before Somerset's execution, Dudley had been created duke of Northumberland. He was himself (judging from his dying declaration) a Catholic, but he certainly took no means to re-establish the old religion. His great aim was to secure the succession to the throne of England for his family. With this view, he married his son, lord Guildford Dudley, to lady Jane Grey, daughter of the duchess of Suffolk, to whom, by the will of Henry VIII., fell the crown, in default of issue by Edward, Mary, or Elizabeth. Northum-

berland now worked upon the weak and dying Edward to exclude Mary and Elizabeth, and nominate lady Jane Grey as his successor. E. at last consented, and a document settling the succession on this lady was drawn up in June, 1553. The king lived only a few weeks after, dying on the 6th of July. Subsequent events entirely frustrated Northumberland's design. King E., during his short reign, founded a great number of grammar-schools, which still exist, and are known as *king Edward's schools*.

EDWARDES, Sir HERBERT BENJAMIN, 1819-68; b. England; early in army service as a cadet in India; in 1841, ensign of the 1st Bengal fusiliers, with which regiment he remained five years, improving himself especially in the native languages. In the Sikh war he was aid to viscount Gough, the English commander-in-chief. After the war he continued in responsible positions in the civil service, but was soon again on military duty, doing service so brave and important as to receive the thanks of parliament. He was commissioner of the Peshawur frontier at the time of the Sepoy rebellion, and raised and sent a large force to aid in the siege of Delhi. For his many services he received the successive decorations of C.B., K.C.B., and K.C. of the star of India. He received the degree of LL.D. from the university of Cambridge. He published *A Year on the Punjab Frontier in 1848-49*.

EDWARDS, a co. in s.e. Illinois, bounded on the s.e. by the Little Wabash, reached by the Louisville, Evansville and St. Louis consolidated railroad; 220 sq. m.; pop. '90, 944. The surface is forest and prairie, producing wheat, corn, wool, tobacco, etc. Co. seat, Albion.

EDWARDS, a co. in s.w. Kansas; formed and organized in 1864; crossed by Arkansas river, and Atchison, Topeka, and Santa Fé railroad; surface rolling, scantily timbered; 612 sq. m. Pop. '90, 3600. Co. seat, Kinsley.

EDWARDS, a co. in s.w. Texas, formed in 1858, organized in 1883; 2316½ sq. m. Pop. '90, 1970. Co. seat, Rock Springs.

EDWARDS, AMELIA BLANDFORD, b. in London, 1831. She began writing for the press at an early age, and was afterward connected with some of the chief literary and political journals in England. She is also known as novelist, traveler, and Egyptologist. Among her works are, *My Brother's Wife*, 1855; *Hand and Glove*, 1859; *Half a Million of Money*, 1855; *Debenham's Vow*, 1870; *In the Days of My Youth*, 1873; *A Thousand Miles up the Nile*, 1877; and *Pharaohs, Fellahs and Explorers* (1891). In 1889 she lectured on Egyptian subjects in the United States, and received several degrees from American colleges. D. April 16, '92.

EDWARDS, BELA BATES, D.D., 1802-52; b. Mass.; graduated at Amherst, and studied theology at Andover theological seminary. In 1828, he was secretary of the American education society, and from 1828 to 1842, the editor of the organ of that society, the *American Quarterly Register*. In 1833, he started the *American Quarterly Observer*, which was soon united with the *Biblical Repository*, Dr. Edwards continuing as editor. From 1844 to 1852, he was editor of the *Bibliotheca Sacra*. In 1837, he was professor of Hebrew at Andover, and in 1848, of biblical literature. Among his works are the *Eclectic Reader*; *Biographies of Self-taught Men*; the *Missionary Gazetteer*; sermons, addresses, etc.

EDWARDS, HENRI MILNE. See MILNE-EDWARDS, HENRI.

EDWARDS, JONATHAN, a celebrated American divine and metaphysician, was b. at Windsor, in the state of Conn., 5th Oct., 1703, entered Yale college in 1716, took his degree of B.A. in the following year, and in 1722 was licensed to preach the gospel. Towards the close of 1723, he was appointed tutor of Yale college, an office which he filled with distinguished success. In 1726, he accepted an invitation to become colleague to his maternal grandfather, Mr. Stoddard, in a church at Northampton, and was ordained in Feb., 1727. Here he labored with intense zeal for more than 23 years, at the end of which period he was dismissed by his congregation. The immediate cause of the rupture between him and his hearers, was his insisting that no "unconverted" persons should be allowed to approach the Lord's table; but some years before, he had alienated the regards of a large number of the influential members of the church by denouncing the reading and circulation of certain books which were immoral and injurious, and by attempting to make a public example of the offenders. E. was a powerful and impressive preacher, somber and even gloomy in his religious opinions and sentiments, but earnest, unaffected, and nobly conscientious. During the famous "revival" of 1740-41, he was much sought after as a preacher, and is in fact often regarded as the originator of that movement. Certain it is that as early as 1734, a local manifestation of religious enthusiasm had taken place in his own parish, of which he published an account, entitled *A Faithful Narrative of the Surprising Work of God, in the Conversion of many Hundred Souls in Northampton*. The quarrel between E. and his congregation shows, however, that the "revival" had not exercised any very strong influence on the community in general, since only a few years elapsed between the ecstasies of devotion and the circulation of obscenity. After his dismissal in 1750, E. became a missionary among the Indians of Massachusetts. While residing at Stockbridge in that state, he composed his famous treatises on the *Freedom of the Will* and *Original Sin*. In 1757, he was chosen president of Princeton college, New Jersey, whither he proceeded in Jan., 1758, but was cut off by small-pox on the 23d of Mar. in the same year.—E. will always be considered a master in dogmatic theology. Calvinism had

probably never so powerful a defender. According to the late Robert Hall, "he ranks with the brightest luminaries of the Christian church, not excluding any country or any age since the apostolic." His great characteristics are depth and comprehensiveness of argument; and were it not that the age for such discussions as E. loved is gone by, few writings would be more worthy of patient study than those of this illustrious divine. Besides the works already mentioned, E. wrote a *Treatise concerning Religious Affections*; the *History of Redemption*; a *Dissertation concerning the End for which God created the World*; and a *Dissertation concerning the True Nature of Christian Virtue*. The last three were posthumously published. A complete edition of E.'s works was published by Dr. Timothy Dwight in 10 vols. (1809), and another at London in 1817. A third was published in 1840, containing an essay by Henry Rogers, and a memoir by Sereno E. Dwight. Also see the memoir by Rev. A. V. G. Allen (Boston, 1890).

In all accounts given of Jonathan Edwards, he is sufficiently celebrated as a severe reasoner and profound writer on metaphysical themes. But they who would understand the influence which he has already exerted, and estimate rightly that which he will continue to exert, must not neglect other points of his nature and work. 1. His humility, modesty, and serenity of spirit endeared him to his friends and made him appear amiable to all who conversed with him. As a Christian he was an example of rational virtue and religion. In him men saw a rare assemblage of spiritual graces united with the richest mental gifts. He read all useful books that he could procure, especially those on theological subjects, examining both sides of a question, studying views which to him were erroneous, and investigating the arguments of extreme infidelity. But the Bible he studied more than all other books. His intimate acquaintance with it is conspicuous in all his writings. Few men were less under the bias of education or of bigotry. He exerted all his powers to find out truth, searching for it as for hid treasure. Every valuable thought he pursued at once as far as he then could. He read pen in hand, not so much to take notes of other men's thoughts as to secure his own. His scholarship was remarkable for the day in which he lived and the opportunities which he enjoyed. Born in an obscure village of a new and thinly settled colony, with the forests around him, and separated by 3,000 m. of ocean from the seats of art, refinement, and knowledge; educated at a college (only three years older than himself) that offered advantages less than academies now supply, he passed all the rest of his years amidst the cares of a laborious profession, on the very frontiers (and some of those years in the heart) of savage life. Yet, with all these hindrances, he was a proficient in classic and Hebrew literature, physics, mathematics, history, chronology, mental philosophy, and ethics. His greatest work was written in four and a half months, during which he carried on the correspondence of the mission and preached, each Sabbath, two sermons in English, and two by interpreters to two Indian congregations, besides catechising the children of both tribes. His neglect of style as a writer is to be regretted. His works were printed very much as first written. Yet a marked improvement was effected in his later years. The style of the *Inquiry Concerning the Freedom of the Will* (written, as has just been said, in so short a time) is considered by competent judges to be as correct as that of most metaphysical treatises. 2. In the early part of his life he acquired a very high character as a minister and preacher. Most of his hearers felt and acknowledged his power. Long before the publication of his writings, his fame as a preacher had spread through the colonies and into Great Britain. To eloquence, as many use the word, he had indeed no claim. He exhibited no studied varieties of voice, no strong emphasis, no graceful gesticulation, no attempt at elegance of style or beauty of illustration. But if eloquence be the power of presenting important truth to an audience with overwhelming weight of argument, and with the whole soul of the speaker thrown into every part of the conception and of the delivery, so that the attention of all is riveted until the end, and impressions are made which cannot be effaced, then Jonathan Edwards has been justly pronounced one of the most eloquent preachers of his own or of any age. His solemn consciousness of the presence of God controlled his preparations, was manifest in his services, and had an irresistible effect on his congregations. His knowledge of the human heart, springing from knowledge of the word of God, skill in mental philosophy, and his own personal experience, enabled him to speak to the consciousness of his hearers. His theological learning was so complete, and his general information so extensive, that he could impart variety and richness of thought to his sermons, and bring illustrations to bear on every point. From first to last his aim was simply the salvation of his hearers and the glory of God. In the introduction to his sermon he explained the passage from which he was to preach, and with great skill presented its whole drift in all its bearings. In the body of the sermon he did not attempt an elaborate proof of his doctrine, but rather placed it before his hearers as a fact, and painted it to their imagination. He laid out his strength in the application, speaking to the consciences of his hearers, applying to different characters the important ideas of the sermon, and closing with a solemn and earnest appeal to every feeling and principle of human nature. He counseled, exhorted, warned, expostulated, as if he was determined not to stop without convincing and persuading

every man. 3. While his visits among his flock were, in a great degree, restricted to the sick and afflicted, he was eminently faithful and successful in other departments of pastoral work, especially in extraordinary labors during "revivals" which sprang up under his ministry, and in conversing with those who sought spiritual counsel. His study was at times thronged with persons who came to lay open to him their minds and hearts. 4. His theological treatises, especially, have made him extensively known, and are the foundation on which his highest reputation will ultimately rest. (1) In these he is distinguished for scriptural views of divine truth, adducing many passages in illustration and proof, examining them critically, arranging them carefully, and drawing conclusions from them with fidelity and skill. He seldom introduces any hypothesis of his own, and betrays little confidence in his own reason unless it is supported by the oracles of God. (2) He presents no partial or contracted views; all are simple, great, and sublime. His mind was too expanded to regard the minor distinctions of denominations and sects. He belonged to no church but the church of Christ, contented for nothing but the truth of God, and aimed supremely at holiness and salvation. His labors coincide so completely with those which the gospel prescribes, that no denomination can appropriate him exclusively to itself. His originality in argument is striking and continued. He never walks in a beaten path. His positions, arguments, and conclusions are his own; and he did much to render theology a *new science*. (3) In controversy he maintained an excellent spirit. His integrity and fairness were conspicuous. The idea of employing sophistry in his argument seems never to have occurred to him as a possible thing. He was kind and sincere; fair in stating the real point in debate; and candid towards his opponents. He carefully avoided personalities and the imputation of unworthy motives to those from whom he was compelled to differ. These excellences as a disputant appear the more remarkable when the circumstances in which he wrote, and the topics which he handled, are considered. The treatise on the affections was written in the heat of a violent controversy which divided and agitated the whole country. In his works on the will, original sin, and justification, he dealt with subjects which had aroused bitter opposition, and replied to persons who had boasted of their victories in vain-glorious and irritating terms. His book on qualifications for communion was composed in the midst of a furious parochial storm, which did not ruffle his temper, although it drove him from his parish and home. (4) While his manner was courteous and his temper undisturbed, his arguments were, for the most part, unanswerable. They derived their strength from the conclusiveness of his reasoning, the employment of different trains of proof, all converging to one result, the anticipation of objections which might be taken to his view, and the skill with which he brought the *reductio ad absurdum* to his aid. The most metaphysical of his writings—*On the Freedom of the Will*—has been described by high authority as "a book which never has been, and never will be, answered." His most practical treatise—*On The Qualifications for Communion*—being an attack on a favorite scheme of lax religionists, aroused indignation all over the country. Yet after a disastrous controversy it has so changed the opinions and practice of the New England ministers and churches, that a mode of admission to church-membership or to a *quasi* membership, then almost universal, is now disused. (5) In all his writings, even the most metaphysical, he aimed at the most important practical results. In them all his immediate success was great, and by them his influence on doctrine and piety has been extended through Christian schools of theology, pulpits, churches, and homes. Some of the themes on which he has given light are the following: God's end in creating this material and spiritual universe; the nature of his government over intelligent minds, and how it is consistent with their freedom; the nature of the virtue which they must possess in order to secure his approbation; the source, extent, and evidences of human depravity; the series of events by which redemption is effected; the qualifications for the church to which the redeemed belong; the grounds on which they are justified; the nature and evidences of the religion imparted to them by the spirit of grace; the distinguishing marks and effects of revivals of religion produced by the effusion of divine influence on men; the induction imparted to them by the spirit of grace, and the distinguishing marks and effects of revivals of religion produced by the effusion of divine influence on men.

EDWARDS, JONATHAN, the younger, second son of the preceding, was born at Northampton, Mass., May 26, 1745; studied the Indian languages at Stockbridge and among the Six Nations, in order to become a missionary; entered Princeton college and graduated 1765; studied theology under Dr. Bellamy; in 1767, became tutor at Princeton; from 1769-95 preached at White Haven (Fair Haven), Conn.; and from 1796-99 at Colebrook, Conn.; in 1799 was elected president of Union college at Schenectady, where he died Aug. 1, 1801. His chief work was *A Dissertation Concerning Liberty and Necessity*, an able exposition of his father's theory of the will. His complete works were edited by his grandson, Rev. Tryon Edwards (Andover, 1842).

EDWARDS, MATILDA BARBARA BETHAM (more commonly BETHAM-EDWARDS), was b. in Suffolk, England, in 1836. She took up the pen at an early age, her first effort in story-writing having been *The White House by the Sea*, which, like several of her later works, has been translated into various languages. Among her numerous novels and novelettes are *John and I*; *Kitty*; *Doctor Jacob*; *Bridget*; *The Sylvestres*; *Exchange no Robbery*; *Pearla*; *Love and Marriage*; *Disarmed*; *The Curb of Honor*; *A Romance of Dijon*; *The Romance of a French Personage*, etc. She has also published *A Year in Western France*, *A Winter with the Swallows in Algeria*, *France of To-Day*, etc., and, in 1885, a volume of *Poems*.

EDWARDS, PIERREPONT, 1750-1826; son of Jonathan, the theologian. He served in the revolutionary army; practiced law; and was a member of congress in 1787. He was U. S. district judge for Connecticut at the time of his death.

EDWARDS, TRYON, D.D., b. Conn., 1800; great-grandson of Jonathan, the theologian; graduated at Yale, studied theology at Princeton, and law in New York; settled in the ministry at Rochester, N. Y., in 1834, and afterwards at New London, Conn. Among his publications are *Christianity a Philosophy of Principles; Self-Cultivation*; etc. He has edited *Charity and its Fruits; Select Poetry for Children and Youth; Jewels for the Household; The World's Laconics; Wonders of the World*; and many issues of the *Family Christian Almanac*. He d. in 1894.

EDWARDS, WILLIAM, 1770-1851; b. N. J.; grandson of Jonathan. He introduced valuable improvement in the manufacture of leather, whereby tanning was accomplished in a quarter of the usual time. To be in proximity to abundance of hemlock bark, he set up a model tannery in the Catskill mountain region. His many improvements greatly advanced the production of leather in this country.

EDWIN, an English Saxon prince, was the son of Ella, king of Northumbria, who died about 589. He succeeded to the throne at the age of three years, but a neighboring potentate, Ethelfrith, invaded and conquered his territories, whereupon the infant E. was carried into North Wales, and was there educated. When he grew up to man's estate, Ethelfrith, fearing that his power would not be secure so long as E. lived, forced him from his asylum, and for many years he wandered about a disguised fugitive. Reaching East Anglia, he claimed the protection of king Redwald, which was readily granted. While residing there, Ethelfrith sent messengers to Redwald, requiring him to deliver E. into his hands, and threatening war in the event of a refusal. Redwald promised to accede to the request. A friend made known the resolve to the prince, and counseled flight; to this E. would not consent, but sat down without the palace, brooding over his misfortunes. While sitting there, Bede states that an unknown person approached him, and promised release from all his sufferings, if he would listen to what should be afterwards taught him. The apparition then placed its hand upon his head, and bidding him remember the interview and the sign, disappeared.

Redwald's queen pleaded the cause of E., and he finally determined to protect him. Raising an army, Redwald surprised Ethelfrith on the Idel, in Nottinghamshire, and defeated and slew him in 617. When E. regained his kingdom, he wooed Edelberga, daughter of Ethelbert of Kent. Her brother, who was a Christian, objected to her alliance with an idolater; but E. promised that he would not interfere with her religious belief. The princess became his wife; and Paulinus, who had been sent by Gregory to assist Augustine in his mission, accompanied her as her bishop.

About this time, E.'s life was attempted by an assassin, sent by the king of Wessex. He escaped with a slight wound, and on the same night the queen was delivered of a daughter. The king thanked his idols for the birth, but Paulinus directed his thankfulness to the Christian Saviour. The king promised to accept the new faith, if Heaven would grant him victory over the king of Wessex. His child and 11 of his household then received the rite of baptism. Raising an army, he defeated his foe, but delayed to fulfill his promise. Paulinus, having heard of the apparition which appeared to him while residing at the court of Redwald, one day entered the apartment in which E. sat, and placing his hand upon his head, asked him if he remembered the sign. The king was visibly affected, and at once assembled his witenagemote to deliberate on the matter of the new religion. Coifi, the high-priest, spoke first, and intimated his willingness to desert the idols, and embrace the Christian faith. A thane next rose and pronounced the beautiful speech which has been versified by so many poets, but which is most effective in the simple serious Saxon of the chroniclers. Coifi then headed the people in destroying the idol temple.

E. and the nobility of his kingdom were baptized in the eleventh year of his reign. Thereafter, he became the most powerful prince in England. He subdued a part of Wales, and his power extended northward to the Lothians. In 634, he fell in battle at Hatfield Chase, in Yorkshire; and in that disastrous fight, one of his children, and the greater portion of his army, perished. The history of this prince has been made the subject of a beautiful poem (*Edwin of Deira*, 1861) by Alexander Smith.

EDWY, EADWIG, or EDWIN (THE FAIR), about 938-58; king of the Anglo-Saxons; eldest son of Edmund I. He succeeded his uncle Eldred in 955. Little is known of his short reign except that he was at enmity with Dunstan, who bitterly opposed his marrying Elgiva. Dunstan was banished from the kingdom, but not long afterwards was restored by the Mercians, who had revolted from Edwy, and proclaimed Edgar king.

EECKHOUT, GERBRAND VAN DEN 1621-74; a painter, b. in Amsterdam; a pupil of Rembrandt, whose style he successfully imitated. As a portrait painter he had a peculiarly superior talent for expressing character. Among his best compositions are "Christ in the Temple," and "Haman and Mordecai."

EECLOO, a t. of Belgium, in the province of East Flanders, stands on the high-road between Ghent and Bruges, and is 12 m. n.w. from the former. It is clean and well built; and has manufactures of woolens, cottons, hats, tobacco, chocolate, soap, etc.;

also breweries, distilleries, vinegar-works, salt-refineries, dye-works, oil-mills, and a thriving trade in linen, cattle, and timber, as well as in grain, for which it has a large weekly market. Pop. '90, 11,642.

EEL, a name popularly given to all serpent-shaped or worm-shaped fishes, and sometimes extended to other animals of similar form, but otherwise extremely different, as the eels in paste, in vinegar, etc. The fishes to which this name is most commonly applied are *malacopterous* fishes destitute of ventral fins, and having the body covered by a soft thick slimy skin, the scales very minute, and often almost invisible, or entirely wanting. Most of them were included in the Linnæan genus *muraena*, and now constitute the family *muraenidæ*, divided by some naturalists into the families *synbranchidæ*, *muraenidæ*, *anguillidæ*, *congeridæ*, and *ophisuridæ*. All these have the skeleton destitute of ribs, and the fin-rays not jointed; whilst the *gymnotidæ*, including the electric eels (see GYMNOTUS), have ribs encompassing the belly, and the fin-rays jointed or branched. In all the eels, the gill-orifices are very small, and are situated far back, so that there is a long passage from the gill-chamber outwards; and hence, the gills not soon becoming dry, these fishes can remain out of water for a considerable time without injury, and some of them occasionally leave it of their own accord. The smallness of the gill-opening is also regarded as probably indicative of feebleness of respiration; and this, as in reptiles, is connected with extreme tenacity of life.—The *synbranchidæ* have the gill-passages so united under a common integument, as to present externally only a single orifice. They are almost destitute of fins. The species are few, and found only in tropical and sub-tropical seas.—The *muraenidæ* are also generally destitute of fins, or nearly so; they are all destitute of scales. They are all marine.—The *anguillidæ*, on the contrary, are fresh-water fishes, although some of them occasionally visit the sea. They have pretty large pectoral fins, anal and dorsal fins extending to and encompassing the tip of the tail, and numerous longish scales imbedded in groups in the skin, so as to resemble lattice-work. To these the congers (q.v.), although marine, are very nearly allied. The *ophisuridæ*, or snake-eels (q.v.), of the Mediterranean and other seas, are more widely different, and are easily distinguished by the tail ending in a conical finless point.

Until recently, all the British fresh-water eels were confounded together as of one species (*anguilla vulgaris*): Mr. Yarrell was the first accurately to distinguish them, and to show that there are at least three, if not four species, differing considerably in form, and in anatomical characters, as the number and form of the vertebræ, etc. Two of these seem to be very generally diffused, the SHARP-NOSED E. (*A. acutirostris* or *A. vulgaris*) and the BROAD-NOSED E. (*A. latirostris*). The difference in the form of the snout, which these names indicate, is very marked and obvious, and the general form of the sharp-nosed E. is also more slender.—The SNIG E. (*A. mediorostris*), found in some of the English rivers, is intermediate in the form of its snout, and is considered superior to the other kinds for the table. Its cervical vertebræ are destitute of the spinous processes which are found in both the other species. It is comparatively small. The sharp-nosed E. seems to attain the greatest size, sometimes almost 30 lbs. weight. It migrates on the approach of winter to the warmer brackish water of estuaries, often entering water which is perfectly salt; or if migration is impossible, it buries itself in mud. Eels are taken in great numbers during winter by means of *eel-spears*, or forks with several prongs, plunged into the mud. Sometimes they are dug out of the mud of river-banks, where large numbers are found congregated together. The eels which descend to estuaries or to the sea deposit their spawn there, and countless multitudes of young eels ascend rivers in spring. The passage of the young eels is called on the Thames the *eel-fare*, from a Saxon word signifying to pass or travel. So strong is the instinct which impels them, that they surmount obstacles apparently far more than sufficient to arrest their progress; they have been seen to ascend the large posts of flood-gates, “those which die, stick to the posts; others, which get a little higher, meet with the same fate, until at last a sufficient layer of them is formed to enable the rest to overcome the difficulty of the passage.” Young eels have also sometimes been met with in large numbers performing migrations on land among moist grass, generally in the evening or during the night; but the purpose of these migrations is not very well understood, nor are they known to take place with regularity.—Those eels which cannot migrate to the sea, breed in inland rivers and lakes.

Eels are very averse to cold, and to this is ascribed their winter descent to brackish water, or hiding of themselves in mud. The number of known species is large, but they all belong to the temperate and warmer regions of the globe. In these, also, the marine fishes to which the name E. is sometimes extended, chiefly abound.

There is a prejudice in some countries—particularly in Scotland—against eating eels, on account of their serpent-like appearance; but generally, as in England, they are highly esteemed. The London market is very largely supplied with eels from Holland; they are sent over alive in welled vessels.

There are various means beside those already noticed employed for the capture of the eel. Weirs and stages are erected across rivers, and baskets, or *bucks*, as they are termed, fixed in them for the taking of the eels during their migrations. These baskets are of large size, and shaped like a huge Chinese jar, in the mouth of which is fitted a

sort of funnel-shaped mouse-trap entrance, composed of flexible withy rods coming inwards to a point, and through which the eels can easily force their way, but when they turn about to find the entrance again, it is closed against them. When the eels are running, as it is termed—that is, during their migrations—many hundredweights are often taken in these basket-traps in a single night. *Eel-pots* are also used for their capture. These are of a similar nature to the bucks, but are smaller and more slender. They are sunk, by means of bricks tied to them, in the most likely runs or narrow spaces between weeds, or close to banks, and through which eels are likely to run. After a thunder-storm, eels always run well, as it disturbs them greatly. Eels are also caught by means of night-lines. These are long lines with heavy weights at each end, and in the middle if necessary, with hooks tied on every yard. These hooks are baited with pieces of dead fish, minnows, or worms. The line is sunk, and laid across stream—or, if fishing for conger-eels, in the sea—with, if it be thought necessary, a small buoy at one end, to recover the line by. These eel-lines should be hauled as early in the morning as possible, or the best eels will be found to have worked themselves off, leaving a mass of knots and slime behind them, to show where they have been. *Swinging* is a favorite amusement with some anglers. A rod or a long stick is provided, bent round at the slender end like the top of a very well used fishing-rod; on the point is fixed a single ring; through this ring is passed a piece of string; one end of this is held in the fisherman's hand. To the other end, on some fine but strong cord, is fastened a stout darning-needle, tied to the cord by the middle. The needle is then baited, or thrust lengthwise into a large lob-worm, until the fine cord alone comes out at the head of the worm. The worm is then drawn up to the ring of the rod. The fisherman then seeks for some hole in which he thinks an E. may be, and applying the point of the rod, pushes the worm into it. As soon as the fisherman believes an E. has swallowed the bait, he gives a slight pull to the string; and the needle, which has gone down the E.'s throat inside the worm perfectly straight, being tied by the middle, turns cross-wise in the E.'s throat or stomach, and hooks him. See *illus.*, *FISHES*, vol. VI.

EE'LEE, or **ILI**, a river of central Asia, rising in China and running w. about 600 m. to lake Balkash. The valley of the Eelee is the usual route between Russia and China.

EE'LEE, or **GOOLDJA**, a city in the extreme w. of China, in central Asia, on the river of the same name, 43° 46' n., and 82° 30' e.; pop. said to be 80,000. It is an important commercial center, and was formerly the place to which Chinese criminals were banished.

EEL-POUT, a name given in some parts of England to the burbot, and on some parts of the Scottish coast to the viviparous blenny.

EELS in paste, vinegar, etc., are animalcules (*infusoria*) of the family *vibrionidæ*. When at rest, they appear like very minute hairs, or bits of very fine thread. Some of them wind themselves about in a spiral form when they move. The species are numerous, and they occur in almost all vegetable substances beginning to corrupt and undergo decay, which they hasten. They are found also in decaying animal matter, and have recently been detected in diseased animal tissues; but the species found in such situations have not the elongated form which has given the name E. to those inhabiting paste a few days old, stale vinegar, etc., or occurring in diseased parts of living vegetables. Whether or not the origination of disease is to be ascribed to their presence in animal tissues, is not yet well ascertained; but in living vegetables this appears to be certainly the case, particularly in the disease of wheat called ear-cockles (q.v.).

EFAT. See **SHOA**, **ABYSSINIA**.

EFFARE, or **EFFRAYÉ** (Fr.), in heraldry, signifies that the animal to which it refers is to be represented as rearing on its hind-legs, as if it were frightened or enraged.

EFFECT. The general impression produced on the mind by the first sight of a picture or other work of art, or the impression which it produces when seen from so great a distance as to render the details invisible. The term has reference both to design and coloring, both of which, if correctly indicated, may be judged of with perfect confidence before either has been completed in detail. Bold sketches of their works are generally made by careful artists beforehand, for the purpose of adjusting the composition and coloring so as to produce the desired effect.

EFFENDI, a title of honor among the Turks, bestowed upon civil dignitaries and persons of various ranks, in contradistinction to the title of aga, borne by courtiers and military men. The word is equivalent to the English sir, or the French monsieur, and is frequently added to the name of an office. Thus, the sultan's first physician is termed *Hakim-effendi*; the priest in the seraglio, *Imam-effendi*; and the minister of foreign affairs was formerly called *Reis-effendi*.

EFFERVESCING DRAUGHTS. See **AERATED WATERS**.

EFFIGY (Lat. *effigies*), a likeness or representation either of the whole figure or of the head and face, as on a coin. See **BRASSES**. It is scarcely an artistic word.

EFFINGHAM, a co. in e. Georgia, separated from South Carolina by the Savannah river, and bounded w. by the Ogeechee; 449 sq.m.; pop. '90, 5599. The surface is level

and mostly covered with forests; productions, corn, cotton, and rice. Co. seat, Springfield.

EFFINGHAM, a co. in s.e. Illinois, on Little Wabash river; 490 sq.m.; pop. '90, 19,358. The surface is mostly prairie and the soil fertile. Co. seat, Effingham.

EFFLORESCENCE is the term applied to the appearance of a white incrustation on the walls of buildings, or when a salt loses its water of crystallization, and presents a white powdery appearance on the surface. Common washing-soda exposed to the air affords a good illustration of this phenomenon.

EFFRAYÉ. See **EFFARÉ**.

EFT, a term of Anglo-Saxon origin, applied both to lizards and newts, which—notwithstanding the important differences between them—were until recently confounded, even by naturalists. The Scotch word *ask* seems to be the exact equivalent of the English *eft*. In works of natural history, the term *eft* is now used as synonymous with newt (q.v.).

ÉGALITÉ, PHILIPPE. See **ORLÉANS, LOUIS PHILIPPE JOSEPH**.

EGAN, PATRICK, b. 1841, in co. Longford, Ireland. He became head of a wealthy business firm in Dublin. In 1868 he organized the Amnesty association for the release of the revolutionist prisoners of 1866–67; later became one of the council of the Home Rule league, and in 1880 was made treasurer of the Land league. Threatened, 1882, with prosecution under the Coercion Act, he left Ireland with the funds, placing them elsewhere for safety. In 1883 he became a resident of the U. S.; and was made president of the Irish National league, which succeeded to the Land league; and in 1889–93 he was U. S. minister to Chile.

EGAN, PIERCE, an English writer of Irish descent, whose *Life in London, or the Adventures of Tom and Jerry*, had great popularity in the first part of the present century. The book was illustrated by George Cruikshank, was one of Thackeray's early favorites, and furnished the hint for Dickens's *Pickwick Papers*; but its author has been strangely ignored by literary historians. His son, also named Pierce Egan, 1814–80, wrote nearly 30 novels, and was well known as the editor of several "penny-dreadful" papers in London. The elder Egan was b. about 1772; d. in 1849.

EGBERT, the most celebrated of the Anglo-Saxon kings before Alfred, was the son of Alcmund, who is said to have reigned in Kent, and was a descendant of the house of Cerdic. In 787, on the death of Cynewulf, king of Wessex, E. laid claim to the throne, but had to give way to another claimant, Brihtric, who was the more powerful of the two. E. was compelled to flee, and took refuge at the court of Charlemagne. Here he remained for 13 years, until, in 800, on the death of Brihtric, he was summoned to England to fill the throne of Wessex. England was at this time divided into three great sovereignties: Northumbria, extending over what were occasionally the separate kingdoms of Deira and Bernicia; Mercia, which had now subjugated the petty powers of Kent, Essex, and East Anglia; and Wessex, which had absorbed Sussex. For the first nine years of his reign, E. drew no sword. His mild government completed the attachment of his subjects, and the peace which he maintained fostered his strength. In 809, however, he marched against the Britons of the west, and after fighting five years in Cornwall and Devon, he succeeded in subduing the wild tribes to at least a temporary subjection. In 823, the most important event in his career took place. At that time a dispute had arisen between the East Angles and their Mercian conquerors, and the former sent ambassadors to E. imploring aid and protection. E. joined the East Angles with an army which, according to the old chroniclers, had a peculiarly fighting appearance, being "lean, meager, pale, and long-breathed." The encounter between the Mercians and the East Angles with their ally took place at Ellandūn (the modern Wilton, according to some), where a furious battle was fought, in which the Mercians were defeated with great slaughter. By this battle the power of Mercia was broken, and Essex and Kent, formerly Mercian provinces, became incorporated with Wessex. For four years after the great battle of Ellandūn, Mercia remained the seat of discontent and strife, and E., in 827, taking advantage of his opportunity, led thither an invading force, and reduced the country to a state of vassalage. Turning next his arms against Northumbria, he compelled that sovereignty also to acknowledge his supremacy (827–828). He afterwards penetrated into Wales, where, in like manner, success attended his arms.

E., now virtually king of England, though both he and his successors until the time of Alfred were in the habit of designating themselves only kings of Wessex, found it necessary, after a few years' comparatively peaceful rule, to direct his attention to a new and foreign enemy. The Danes, who had been making frequent descents upon the island since 832, and who in that year had defeated the forces of E., reappeared in 835 on the coast of Cornwall, where they were joined by numbers of the Cornish Britons. E., however, at the head of his West Saxons, met them at Hengestes-dūn (Hengstone), and in a great battle completely overthrew them. In the following year, he died, after a reign of 37 years.

EGEDE, HANS, was b. in Senjen, in Norway, Jan. 31, 1686, studied in Copenhagen, and was appointed to the church of Vaagen in Norway in 1707. Having determined to proceed to Greenland to convert the natives, he resigned his *cure* at the end

of ten years; and, after devoting himself with assiduity to the study of the language, embarked for Greenland, with his wife and sons, in 1721. He remained 15 years in Greenland, during which time he labored zealously among the people, and by his preaching and teaching secured a permanent footing there for the Christian mission, which owed its origin to him. On his return to Copenhagen, he employed himself in instructing missionaries in the dialects of Greenland; and in 1740 he was made a bishop. He died in 1758. He has described the course and success of his labors in *Det gamle Grønland's nye Perlestrøtion* (Copenh. 1729 and 1741). He was ably seconded in his labors by his wife and his sons, Povel and Niels.—POVEL (or PAUL) EGEDE, 1708–89, who was his father's successor, and was also a bishop, translated the gospels and several devotional works into the Greenland language, and compiled a grammar and dictionary for the use of the Greenland mission; the latter appeared in 1750 under the title *Dictionarium Grønlandico-danico-latīnum*.

EGER, a t. and river of Austria, in the province of Bohemia.—1. The town E. stands on a rock on the right bank of the stream of the same name, is 90 m. w. of Prague, and near the Bohemian frontier. Formerly, it was a border fortress of some importance; its walls, however, have been almost entirely pulled down, and its fosses filled up with rubbish. Among the conspicuous edifices of E. are its churches, of which there are four—one of them, the deanery church, very handsome; the market-place, within which is the large town-hall; two monasteries, a Dominican and a Franciscan; and the barracks. East of the market-place is the house of the burgomaster, in which Wallenstein was assassinated in 1634. The ruins of the imperial burg or citadel, formerly the residence of kings and emperors, is situated in an angle of the fortifications above the river. From the midst of these ruins rises a singular square black tower, constructed of masses of volcanic tufa. The double chapel, consisting of two stories, the upper supported by graceful marble pillars, is a fine specimen of Gothic architecture. An avenue, nearly three m. long, leads from E. to Franzensbrunn (q. v.) E. has manufactures of broad-cloth, kerseymeres, cottons, chintz, leather, soap, etc. Its industry and commerce have greatly increased since it became a point of junction of five railways. Pop. '90, 18,458.—2. The river E. rises 12 m. n.w. of the t. of E., flows first s.e. to E., then advances in a general n.e. direction, passing Elbogen, Saaz, Birdin, and Theresienstadt, near which town it joins the Elbe, after a course of about 120 miles. Its current is rapid, and no part of its course is navigable.

EGE'RIA was the name of the Nymph or Camena, from whom, according to the legend, king Numa received the ritual of public worship which he established in Rome. The grove where Numa met the goddess to receive her instructions was dedicated by him to the Camenæ. Roman legends speak of two groves dedicated to E.—one near Aricia, the other before the Porta Capena at Rome, where the grotto of E. is still shown.

EGERTON, FRANCIS. See BRIDGEWATER.

EGG, Ovum. In a great majority of the different kinds of animals, reproduction takes place by means of eggs; in other words, the animals are *oviparous*. It is only in the *mammalia* that we find animals truly *viviparous*; whilst the *marsupial* quadrupeds and the *monotremata* form connecting links, in this part of their natural history, between the *mammalia* which are *viviparous* in the fullest sense of the term, and the warm-blooded animals (birds) which are *oviparous*.

To the articles REPRODUCTION and DEVELOPMENT OF THE EMBRYO, we must refer for an exhibition of the differences between *oviparous* and *viviparous* reproduction, and of that original and essential agreement in important particulars, which has been strongly asserted in the saying, *Omne animal ex ovo* (Every animal is produced from an egg). To the article DEVELOPMENT OF THE EMBRYO also reference must be made for what may be called the *history* of the E., and the development and uses of its several parts.

The number of eggs varies extremely in different animals, some birds producing only one at a time, or in a year, others twenty or nearly so, whilst the roe of the herring, cod, and many other fishes, contains myriads of eggs. The eggs of some animals are enveloped in a gelatinous mass; those of some are joined together, and are laid in a kind of string; those of others are connected together in various ways. For notice of such peculiarities, we must refer to the articles on different classes of animals.

The economical uses of eggs are well known. The eggs chiefly used are those of birds, although the eggs of turtles are also in great repute as an article of food and luxury, and those of fresh-water tortoises are valued for the oil which they yield. The birds' eggs chiefly used for food are those of the species commonly domesticated as poultry, and others allied to them—gallinaceous birds and web-footed birds. Of gallinaceous birds, the common domestic fowl, the turkey, the peahen, and the guinea-fowl, produce the eggs most generally used and brought to market in different parts of the world; of web-footed birds, the common duck is in this respect the most important, although the eggs of other *anatidæ* are also used for food, and those of some of the other web-footed marine-birds are much sought after by the inhabitants of the wild and rocky shores which they frequent. Thus, the eggs of gulls and guillemots afford an important article of food to the people of St. Kilda, and of some of the Orkney and Shetland

islands, as well as to the inhabitants of Iceland and other far northern regions. It is in quest of eggs, as well as of young birds, that the dangers of the most tremendous precipices are braved by men whom their companions let down by ropes, and who gather the eggs from the rock ledges. The coasts of Labrador are also visited by *egggers*, who collect the eggs of sea-birds, and carry them for sale to some of the American ports. The eggs of some of the sea-birds of the West Indies are of considerable commercial importance. See EGG-BIRD.

EGG, AUGUSTUS LEOPOLD, 1816-63; b. London; painter and member of the royal academy. He was a well-trained and talented painter of *genre*, chiefly of compositions from poets and novelists. At the time of his death he might be ranked among our best painters in his special class, but he had no marked originality of style. Among his works are "Queen Elizabeth Discovers She is no Longer Young;" "Peter the Great Sees Catherine for the First Time;" "Charles I. Raising the Standard at Nottingham;" "The Night Before Naseby;" and the dinner scene from the *Taming of the Shrew*.

EGG, CHEMISTRY OF. An ordinary good-sized hen's egg weighs about 1000 grains, of which the white constitutes 600 grains, the yolk 300, and the shell 100. The white or glaire of the E. is a strong solution of albumen (q.v.) in water, and whilst readily miscible with water in its ordinary state, it becomes insoluble when subjected to heat, as in boiling an egg. In 100 parts, the white or glaire of E. consists of—water, 80; dry albumen, $15\frac{1}{2}$; salts, etc., $4\frac{1}{2}$. The yolk or yelk of the egg is composed of a strong solution of albumen, through which multitudes of minute globules of oil are suspended, which render it essentially an emulsion. In 100 parts, it consists of—water, $53\frac{1}{2}$; dry albumen, $17\frac{1}{2}$; oil (with small proportion of salts), $28\frac{1}{2}$.

EGG, or EIGG, an island 12 m. off the w. coast of Inverness-shire, and 8 m. s.w. of the s. point of Skye. Its length is about $6\frac{1}{2}$ miles. It consists chiefly of trap, which in the n. alternates with sandstone and limestone, the latter rocks containing oolitic fossils, carbonized wood, and coal. The scuir of Egg, in the s.w., rises 1339 feet. The upper 470 ft. of this hill is a mass or vein of pitchstone, $1\frac{1}{2}$ m. long, and 100 ft. broad. Some of the pitchstone forms straight, inclined, or curved columns, from a few inches to nearly two feet in diameter. In one place, the pitchstone overlies red sandstone, conglomerate, trap, and the silicified wood of an oolitic pine. In the s. part of the isle is a large cave, entered by a narrow opening, through which only one person can creep at a time. Here it is traditionally related that the laird of Macleod, to revenge an injury done to some of his clan, smoked to death all of the inhabitants (200 Macdonalds) of the isle, who had hid themselves in the cave.

EGG, MUNDANE. See MUNDANE EGG.

EGGA, a large t. of western Africa, is situated on the right bank of the Niger, in lat. $8^{\circ} 43'$ n., long. $6^{\circ} 20'$ e. It is one of the trading stations of the Royal Niger Company. Its streets are narrow; the houses are principally huts built of clay, the walls smooth, and stained with indigo. Great quantities of narrow cotton cloth, only a few inches in breadth, and generally dyed blue, are manufactured here. The inhabitants are enterprising and commercial; many of them possess canoes, in which they trade up and down the Niger. The chief articles of trade are beautifully carved calabashes, cloth net-work, corn, yams, sweet potatoes, dried fish, and a few European articles, as beads and gunpowder. The population, which is said to be 8000, is partly Mohammedan and partly pagan.

EGGAR MOTH, the name of certain species of moth, of the genus *lasiocampa*, allied to the silk-worm moths. One species (*L. trifolii*), of a uniform foxy ochreous color, with wings expanding about 2 in., produces a caterpillar as thick as a swan's quill, hairy, and ochreous brown, which feeds sometimes on broom, but frequently in clover-fields.

EGG-BIRD, *Hydrochelidon fuliginosum* or *sterna fuliginosa*, a bird of the gull family, sometimes called the SOOTY TERN. It is fully larger than the common tern of the British shores; has a long, slender, nearly straight, compressed, sharp bill; very long, narrow, and pointed wings, and a long deeply forked tail: the general color is glossy black on the upper parts, except the forehead and the edges of the wings, which, with the under parts, are white. It abounds in the West Indian seas, and is to be seen in myriads on and near some of the *keys* or low barren islets where it breeds. When visitors land on these keys, the disturbed birds rise and fly about in clouds which darken the air, whilst their turmoil overpowers even the roar of the breakers. The nest of the egg-bird is merely a little excavation in the sand, and usually contains three eggs, which are fully 2 in. long, of a pale-cream color, sparingly marked with light-brown and purple tints.

EGGLESTON, EDWARD, D.D., b. Vevay, Indiana, 1837; became a Methodist minister and subsequently pastor of a church in Lee Avenue, Brooklyn, N. Y., which professed no sectarian creed. He has written many successful novels, dealing with life among the early settlers of Indiana: *The Hoosier Schoolmaster*, 1871; *The End of the World*, 1872; *Mystery of Metropolisville*, 1873; *The Circuit Rider*, 1874; *Roxy*, 1878; and has also published biographies, juveniles, etc., besides several interesting and valuable serial papers, historical or descriptive; *A Household History of the United States* (1888); *The Faith-Doctor* (1891); *Duffels* (1893); *Stories of Great Americans* (1895); *The Beginners of a Nation* (vol. 1, 1897), etc.

EGGLESTON, GEORGE CARY, b. Vevay, Ind., 1839; bro. of Edward. He was educated at Indiana Ashbury univ. and at Richmond college, Va.; studied law, but abandoned that profession for literature. He was for some years editor of *Hearth and Home*, and literary editor of the *Evening Post*; and has published *How to Educate Yourself*; *A Man of Honor*; *A Rebel's Recollections*; *American War Ballads and Lyrics* (1895); *American War Ballads and Lyrics* (1897), etc.

EGG-PLANT, *solanum melongena*, an annual usually less than 2 ft. high, with stem partially woody; fruit very much resembling an egg in appearance, and varying in size from that of a hen's egg to that of a swan's egg, in color generally white, yellow, or violet. The fruit is much used as food, not only in the East Indies, of which the plant is a native, but in warm countries generally. The fruit is known by various names—as egg-apple, auberjine, brinjal, etc.

EGGS, EASTER. See EASTER.

EGGSHELL CHINA, a very thin and translucent variety of china, originally made in China, but now produced in European factories. A mold of plaster of Paris is filled with barbotine. A thin film of this material at once adheres to the mold, owing to the absorption of its moisture by the gypsum. The liquid barbotine being then thrown out, the mold, with the film adhering to it, is put into the kiln. On removing from the kiln, the baked film can readily be separated from the mold.

EGHAM, a village in the n.w. of Surrey, on the left bank of the Thames, 18 m. w. of London. In the vicinity is Runnymede, a meadow on the Thames, where king John conferred with his barons before signing the Magna Charta in 1215. Near also is Cooper's Hill, rendered famous by Denham and Pope.

EGINHARD, or EINHARD, the biographer of Charlemagne, was b. towards the end of the reign of Pepin, or the beginning of that of Charlemagne. At an early age, he repaired to the court of the latter monarch, and became a pupil of Alcuin. His talents and acquirements gained him the favor of the emperor, who appointed him his private secretary, and superintendent of public buildings. E. accompanied the emperor in all his marches and journeys, never separating from him except on one occasion, when he was dispatched by Charlemagne on a mission to pope Leo. On the death of the emperor, he was appointed preceptor to Lothaire, son of Louis le Débonnaire, and for a number of years afterwards appears to have been lay abbot of various monasteries; but ultimately becoming tired of secular life, he retired to the secluded town of Mühlheim. Here he erected a monastery, and changed the name of the place from Mühlheim to Seligenstadt (City of the Blessed). He is said to have now become a monk, but this is scarcely authenticated. E. died 14th Mar., 840, and was buried beside his wife, who died in 836. The two coffins are now shown in the chapel of the castle at Erbach. The counts of Erbach trace their descent from Eginhard. His *Vita Caroli Magni*, completed about the year 820, with respect to plan and execution, as well as language and style, is incontestably the most important historical work of a biographical character that has come down to us from the middle ages. It was frequently used as a school-book, and was therefore copied *ad infinitum*. The best German edition is that of Pertz, in the *Monumenta Germaniæ Historica*. His *Epistolæ*, 62 in number, are also of considerable value in a historical point of view. The French consider the edition of E.'s works by M. Teulet, with a translation, and life of E. (1848), to be the best and most complete. E.'s second work, the *Annales Regum Francorum*, *Pippini*, *Caroli Magni*, *Hludowici Imperatoris*, embraces the period from 741 to 829. According to a pretty legend, E.'s wife, Emma, was a daughter of Charlemagne. A mutual affection had arisen between them, and on one occasion when the lovers were enjoying a nightly interview, a sudden fall of snow covered the spacious court, thus rendering retreat impossible without leading to a discovery. As the traces of female footsteps could not excite suspicion, Emma carried her lover across the court on her shoulders. This scene, it is said, was observed from a window by Charlemagne, who united the affectionate pair in marriage. On this legend Fouqué founded his romance of *Eginhard and Emma*, and Longfellow has made it the subject of a short poem.

EG'LANTINE, a name sometimes given to the sweet brier (*rosa rubiginosa*), but also sometimes to other of the smaller-flowered species of rose.

EGLINTON and WINTON, ARCHIBALD WILLIAM MONTGOMERIE, Earl of, K.T., twice lord-lieutenant of Ireland, was b. at Palermo, in 1812. He was a well known patron of the turf and field-sports, and his name is particularly associated with a splendid revival of the mediæval tournament, which he gave at Eglinton castle in 1839 (see *TOURNAMENT*). Lord E., who was at various times lord-lieutenant and sheriff-principal of Ayrshire, lord-rector and dean of the faculty of Glasgow university, etc., died in 1861.

EGMONT is the name of the principal harbor of the Falkland isles, and of an active volcano in New Zealand, besides several other unimportant places.—1. Port E. is on the n. coast of the more westerly of the principal two islands of the group, its seaward barriers being the islets of Keppel and Saunders. It is in lat. 51° 21' s., and long. 60° w. The anchorage is good; and the shores afford fresh water, but are almost destitute of wood.—2. Mount E. is on the northerly island of its own group, rising 8,270 ft. above the sea. It is 18 m. s. of New Plymouth, in lat. 39° 15' s., long. 174° 13' east.

EGMONT, LAMORAL, Count, PRINCE OF GAVRE, was b. in the castle of La Hamaide, in Hainault, in 1522; and inherited his property and titles from his elder brother Charles. He accompanied Charles V. on his expedition against Algiers in 1541, and followed that monarch afterwards in all his campaigns, but without distinguishing himself greatly. After the accession of Philip to the throne, E. commanded, with great success, the cavalry, in the battle of St. Quentin, 1557, and next year in that of Gravelines; and when Philip finally returned to Spain, he left E. governor of Flanders and Artois. In this position, E. entered into alliance with the party in the Netherlands that were dissatisfied with the Catholic policy of Philip, and from a courtier became all at once a man of the people. His proud, imperious character, however, and his subsequent conduct, have induced many to suppose that, like his bosom-friend, the prince of Orange, he was less actuated in this by high motives than by self-interest, or at least by disappointed ambition. The more common opinion, however, is, that he was a humane and virtuous patriot, who, although indifferent to Protestantism as a religion, was anxious to do justice to all the members of that oppressed faith. When Margaret, duchess of Parma, against the will of the Protestant party, was made regent-general of the Netherlands, E. and the prince of Orange entered the council of state, and held the command of the few Spanish troops. At first he sided with the party who were discontented with the infringement of the liberties of the provinces, and the introduction of the inquisition; but when insurrection broke out, he at last broke with the prince of Orange and the "Beggars' league," as it was called. He seemed to have restored order, and to be maintaining it, when, in April, 1567, the duke of Alba was sent as lieut. gen. to the Netherlands. The prince of Orange and other chiefs of the insurrection left the country; E. wishing to save his private property, remained, thinking his return to the court had secured his safety. When Alba entered Brussels, 22d Aug., E. went to meet him, and sought to secure his favor by presents. He appeared to have gained his confidence, when suddenly, after a sitting of the council, he and count Hoorn were treacherously seized, and carried to the citadel of Ghent. The states of Brabant sought to withdraw E. from the bloody tribunal, as it was called, instituted by Alba, and E., as a knight of the Golden Fleece, denied its competency. But all in vain. He was called upon to justify himself against 90 counts of accusation; and as he persisted in protesting against the incompetency of the court, and thus left many of the points unanswered, he was held guilty of contumacy, and along with count Hoorn condemned to death. On the following day, June 4, 1568, they were both beheaded in the market-place of Brussels. Although E. hoped for pardon to the last, and intercession was made for him from the highest quarters, he died with the greatest composure. It is related that as he received the fatal stroke, Johanna Lamil, who had been his mistress, fell down dead, and the people, in a paroxysm of sympathy, dipped handkerchiefs in the blood that seemed shed in martyrdom to freedom. E. left 11 legitimate children, of whom 3 were sons. The whole of his property, movable and immovable, was confiscated with the greatest rigor. See *Correspondance de Marguerite d'Autriche, Duchesse de Parma* (Bruss. 1842), and *Correspondance de Philippe II. sur les Affaires des Pays-Bas* (Bruss. 1848-51, 2 vols.). Goethe has made the death of E. the subject of a tragedy.

EGOISM (from Lat. *Ego*, I), in philosophy, is the theory that self-existence is the only certainty. This theory is supposed to have been held by a certain sect of the followers of Descartes (q.v.). Reid (*Intellectual Powers*, Essay II, chap. 8) says that some of Descartes' followers, who doubted everything save their own existence and the existence of the operations and ideas of their own minds, remained at this stage of his system and so obtained the name of egoists. Hamilton in a note on this passage expresses his doubts about the existence of this sect of egoists. Stewart (*Dissertation*, pt. I, chap. 11) says that the name of egoists was applied to those followers of Descartes who maintained that no man can have full assurance of anything but his own individual existence. Stewart and others hold that such egoism is the logical consequence of Berkeley's philosophy. As a term of ethics, egoism denotes the habit of doing things which tend directly or indirectly to one's own advantage to the neglect of those things which benefit others. In such a system, the advantage of the *Ego*, or individual's own self, is the standard of action. Sidgwick, *Methods of Ethics*, p. 109, says, "By egoism we must mean the system that fixes as the reasonable ultimate end of each individual's actions his own greatest happiness: i.e., a life so arranged that the excess in it of pleasurable over painful consciousness shall be the greatest possible." See further, Sidgwick, op. cit., book II., and Spencer's *Data of Ethics*, chap. XI-XIV. See also ALTRUISM.

EGRET, a name often given to various species of heron (q.v.), particularly those which, at least during the breeding season, have the feathers on the lower part of the back lengthened and their barbs loose, so that this part of the plumage is very soft and flowing. Most of the egrets have beautiful white plumage. The distinction between egrets and other herons is not, however, very strongly marked, and the names are often used indiscriminately, although the name E. is never given to the common heron. E. plumes are used for ornamental purposes, particularly the occipital crest and scapulars of the LITTLE E. (*ardea garzetta*); and the name E. (Fr. *aigrette*) has become a common term for a tuft of feathers, although it is said to be derived from the French *aigre*, harsh.

on account of the harshness of the voice of the bird. In old English bills of fare, egrets are mentioned as if they were abundant; and not fewer than 1000 "egrittes" are included in the bill of fare of a single great feast, given at the enthronization of George Neville, archbishop of York, in the reign of Edward IV.; but as there is no other evidence that any species of *E.* was ever otherwise than of very rare occurrence in Britain, great probability seems to attach to the opinion originally advanced by Dr. Fleming, that perhaps the lapwing might be meant, "the most common bird with a crest."

EGYPT, a country in northeast Africa, extending from the Mediterranean to the first cataract of the Nile at Syene, from lat. $24^{\circ} 6'$ to $31^{\circ} 36'$ north. The Greek name, Egypt, found already in Homer as *Aigyptos*, has not as yet been explained sufficiently. The national name was Kemi(t), "black country," from the color of the fertile soil (derivatives: *chemistry*, *alchemy*, i.e. "Egyptian science"). The Semitic name *Masr* (Assyrian, *Musru*; Hebrew, *Misraim*) seems to point to its fortified frontiers. The country is nothing but the bed of the Nile amidst the Libyan desert, the cultivated soil extending only to the limits of inundation, inclosed between the hills of the (western) Libyan side and the mountains of the (eastern) Arabian, which at some distance eastwards rise to an altitude of about 1000 ft. above the level of the sea. The Delta, beginning at Cairo (lat. $30^{\circ} 15'$ north), where the Nile divides itself into two great branches (those of Rosetta and Damietta) and several small canals which formerly were branches of equal importance (7 branches in the Greek period), has been gained from the sea by the mud deposits of the Nile during some millenia. The cultivable soil in the narrow valley covers only about the space of Belgium. Good administrations increase it, constructing means of irrigation; neglect of the canals reduces it, for the absence of rain makes the cultivation depend wholly upon the yearly inundations. These, which are caused by the tropical spring rains in the interior of Africa, reach Egypt in June and continue until October. In November, the inundated fields are dry enough to be sown.

Geology.—Between Egypt and Nubia is a chain of granite rocks, interrupting the course of the Nile by cliffs and forming the cataracts of Assuan (Syene). The two ranges of hills on the two sides of the Nile valley (the Arabian and Libyan side) consist in the main of cretaceous sandstone, but from Esneh, of limestone. The eastern desert rises to elevations of 6000 feet; the rocks consist of granite, basalt, porphyry, and breccia. All these stones were used for the buildings and sculptures of the ancient inhabitants, the quarries of Syene especially furnishing the best material for obelisks, etc. The western desert is nearly unbroken, though some valleys contain oases. The Delta consists entirely of alluvium of the Nile, argillaceous earth mixed with sand. Back of the sand hills which form the coast are salt marshes and marshy lakes.

Climate.—The climate of Egypt is very warm, but healthful in the upper parts, owing to the dry air from the desert; and consumptive persons are often benefited by spending the winter in Egypt. Perfect acclimation, however, is difficult for Europeans. The disregard of sanitary rules makes the native population frequently a prey to plague and cholera, though these are now somewhat diminished, since the sanitary measures of the government have been perfected. Dysentery and ophthalmia are common.

Flora.—The flora, formerly quite tropical, is now not very different from that of southern Europe. Its most characteristic features are the absence of any wild vegetation, especially of woods. The few trees are date and doom-palms, sycamores, tamarisks, acacias, mulberry-trees. The chief field-products are wheat, sugar-cane, tobacco, indigo, and lately cotton. Durra is the only African element among them. Of the two famous water-plants cultivated in antiquity, the papyrus has disappeared, and the lotus has become rare.

Animals.—Similarly the animals have lost all African character, and the hippopotamus and crocodile have retreated to Nubia. The domestic animals now include the one-humped camel introduced after the Christian era. The common riding-animal is the strong Egyptian ass. Buffaloes and sheep are the common herd-animals. Tame birds (many pigeons) and wild water fowls (ibis, egret, pelican, etc.) are abundant. Among the numerous reptiles, the asp and the cerastes are dangerous. The Nile contains many fish, of which the binnee (*cyprinus bynni*), the bultee (*labrus niloticus*), the *oxyrinchus* of the Greeks, and the silurus (*bayad*) are most remarkable. The insect-plague is great, especially of scorpions and locusts. The sacred scarabæus-beetle is still frequent.

Stones of Egypt.—See above. Alabaster is found in Middle Egypt. The mines around Egypt, as well as the ancient gold mines of Nubia, are not very productive.

History.—All historical books written in hieroglyphics have been lost. Their existence is proved only by fragments of a short extract on papyrus preserved in Turin. Manetho, a priest of Sebennytus, under Ptolemy Philadelphus (3d century B.C.), wrote an Egyptian history in three books, which has also been lost. Epitomes of great inaccuracy are preserved in the works of Josephus, Julius Africanus (300 A.D.), Eusebius, and George Syncellus. Herodotus gives some good material; Diodorus and Eratosthenes are far less reliable. The inscriptions are now the greatest aid, but are not always satisfactory. The worst difficulty is the total absence of a reliable system of chronology. The Egyptians themselves had no era, but dated after the years of every king; and the loss of all historic works prevents our connecting each reign with its predecessor. In

the scanty extracts from Manetho's history, the chronological numbers are mostly corrupted. Thus the different systems of modern scholars lack any solid foundation and date—for instance, king Menes, 5702 B.C. (Boeckh), 5613 (Unger), 5004 (Mariette), 4400 (Brugsch), 3892 (Lepsius), 3623 (Bunsen), 200 (Sharpe). At the present time, scholars refrain from these attempts, and only give approximate dates, or "minimal dates," showing before which year a king *must* have reigned, and leaving it doubtful whether he lived 100 or 1000 years before. Up to the present time, no date before the 8th century has been fixed with absolute certainty. The approximate estimation is uncertain after 1600, even as to the century to which a king can be attributed. Manetho's division of the whole history up to 342 B.C. into 30 dynasties or groups (not families) of kings has been confirmed in general. Dyn. 1-6 form the Ancient Empire; 11-14 the Middle Empire; while with Dyn. 17 begins the New Empire.

Egypt was a civilized state, it seems, at as early a date as Babylonia. Its civilization may have been derived from that earliest habitation of mankind, but before the year 3000 its development had led to perfect independence and had reached a higher degree even than that of Babylonia. The earliest history is, however, obscure. The later priests filled many thousands of years with the mythical reigns of the different gods, after which they placed 4000 or 1300 years of the demigods or *manes*, i.e. prehistoric kings, whose names had been lost. The first historical king is Menes (*Mni*) from Thinis, probably the first ruler uniting both parts of Egypt. Before him it was divided into the Delta and the Southern Land, and the royal titles distinguish "both countries" even in the latest periods. (Note the Hebrew name, *Mizraim*, "the two Egypts.") He is said to have had his residence near Memphis, where he turned aside a branch of the Nile, and was slain by a hippopotamus. Similar anecdotes given by Manetho are all we know about the first three dynasties; and such remarks as: "Menes' son Athothis wrote a medical book," "Sesonchis was a very tall man," "Under Nefercheres, the Nile flowed eleven days with honey," etc., are apparently non-Manethonian and later additions. Complete lists of their names have been found on later monuments. Of the fourth dynasty we have authentic monuments enough, because its powerful kings were great builders and in their time it became the custom to construct large tombs. The first king, Snefru, conquered the peninsula of Sinai, where he opened the copper mines at Wadi Maghara. His two successors, Khufu (Cheops) and Khafre (Chephren), built the two greatest pyramids, the grandest works of Egyptian architecture. The great sphinx near their pyramids, in which some scholars have seen the most ancient monument of Egypt, was considered a work of Chephren according to later tradition. Other kings were Dadefrê, Menke(rv)rê or Mykerinus, the builder of the third great pyramid, Shepseshaif. All monuments of that period (the end of fourth millennium), the wonderful statues of Chephren, found in a pit at Gizeh, and the finely sculptured tombs of the high officials, buried around the pyramids, show a perfection of the national art never reached afterwards. The fifth dynasty (12 kings) has left less remarkable monuments; but a private tomb, that of *Ty* in Sakkara, is the largest of its kind. The last king, Onnos of Manetho, introduced the custom of covering the funeral chamber of his pyramid with inscriptions. This example, followed in the sixth dynasty by *Ti* (read *Atofi* ?), Ppy I. (Apopy ?), Mernrê, Ppy II., and Neferkrê, has furnished us the many texts of their pyramids opened in 1880,—magic formulæ of no historic, but of great religious and linguistic interest, being copies of books so ancient that they were partially unintelligible to the scribes of that remote age. Ppy I. has left traces of his constructions in all parts of Egypt, and waged a great war against the tribes of the Sinaitic desert and in Palestine, for which he used negro troops from Nubia (Nubia being already tributary) in great numbers. Most kings of this period had built their residences, every king built a new city—around Memphis. Ppy founded the city of Memphis, famous afterwards, which received its name from his pyramid *Mennofer*. Ppy II. reigned over 90 years. Whether Queen Nitrocris, whom Manetho names as the last member of the sixth dynasty, and of whom he and Herodotus relate interesting stories, is a historical person, is very doubtful.

Dynasties 7 to 11, especially 7-9, form a very obscure period which has left monuments of only few kings out of some dozens. The reason is that, after dynasty 6, the princes of the *nomes* (counties) became more and more independent, and the power of the king consequently decreased. Dynasties 7 and 8 were of Memphitic origin, 9 and 10 of Heracleopolitan. The tombs of Siat (published recently by Griffith) show us that the kings in Heracleopolis had to fight continually against rebellious nomarchs (counts), especially against those of Thebes. These had made themselves independent very early, and in dynasty 10 began to claim even the royal title. They (dyn. 11) succeeded in conquering the whole country in a long struggle, and the last six kings of this family, the members of which had nearly all the names *Antef* or *Mentuhotp*, ruled over the reunited kingdom. They first made Thebes, formerly an insignificant provincial town, the capital. One of them, *Sankhkere*, sent the first expedition of which we know to *Punt* (see below). The greatness of Thebes dates still more from the succession of the twelfth Theban dynasty, beginning, probably, about B.C. 2500. The first king, *Amenemhêt I.*, strengthened the royal power by subjecting the rebellious nomarchs so far that the new dynasty was able to inaugurate a period of high political and intellectual strength, of peace and wealth. This period seemed to the later Egyptians the golden age,

LIBRARY
UNIVERSITY OF

especially of literature, whose poetical style formed the model for all periods. It does not seem that the twelfth dynasty possessed more of Asia than the copper mines near Mount Sinai; but it conquered Nubia, the land *Koshi* (the biblical *Kush*), up to the second cataract and beyond it. Usertesen II. built there (at Semne) two strong fortresses on both sides of the Nile, and a tablet announces that no negro was allowed to pass this frontier from the south. The Pharaohs began to explore systematically the gold mines of that country, and kept this province for centuries under many struggles. The internal works of dynasty 12 are very numerous; many cities, especially Thebes and Heliopolis (*On*), besides also those of the eastern Delta (Tanis, Bubastis, etc.), have been embellished, and the province of the Fayum gained for agriculture. The latest excavations of Fl. Petrie have proved that *Amenemhêt III.* was the king Moiris of Herodotus, who constructed a great basin for a branch of the Nile flowing into that oasis and losing itself in swamps. In the middle of the basin the two pyramids (i.e., large bases), with the colossal statues on the top were found, and near the pyramid of the king at Hawara the largest of all Egyptian temples, the so-called Labyrinth, of which, unfortunately, only some foundation stones have been preserved, representing not Abraham's immigration as some have thought, but a caravan of Semitic merchants, found in a tomb of dynasty 12 at Benihasan. It refutes the wrong opinion that Egypt excluded strangers even more rigorously than China. The succession of the different kings called Amenemhêt and Usertesen is: A. I., U. I., A. II., U. II., U. III., A. IV., and a queen Sebknefrurê, who reigned altogether 194 years. After this family had died out Egypt returned to its former bad condition in dynasties 13 and 14. Of more than 130 kings, the greater number reigned only two to four years, many some months, and probably different usurpers claimed the crown at the same time. Few monarchs, as Neferhotp and Sebkhotp V., gained sufficient power to leave some monuments. At the end of the Middle Empire (2000 or later), Egypt suddenly was conquered by a foreign people, whose rulers Manetho calls *Hyksos*, i.e., shepherd kings. Their statues show that they had emigrated from a remote country, and were of non-Semitic (Turanian ?) race. After some time the Hyksos kings allowed tributary princes in Upper Egypt, and kept only the Delta under their direct domination. For their capital, they built a strong fortress in the Sethroitic nome, on the northeastern frontier, called Auaris (Hatuaret), where a numerous garrison watched the subject country. Their god was the warlike Sutekh, but they accepted the Egyptian language and customs. The uncertainty concerning the duration of the Hyksos time (dyn. 15-17) and the number of its kings is responsible for the defects of the earlier chronology. The tributary princes of Thebes (dyn. 17) became more and more powerful, until Sekenenrê III. after 1700 threw off the yoke of the foreigners, provoked, as a popular tale relates, by the insolence of his sovereign Apoph (is). He was slain, but his son, Kames, and afterward Amosis (Iahmose), who married the princess Nefertare and succeeded to the old Theban family, continued expelling the Hyksos, until they surrendered, besieged in Auaris, their last fortress. Amosis, the first king of dynasty 18, inaugurated the glorious period of conquest, introducing Egypt into universal history. His unlimited power (the many small princes had disappeared during the war) and the army maintained and practiced in the long struggle, enabled Amosis to conquer Phenicia and Palestine, where, in his fifth year, he took the city of Sharuhén (in Simeon). His son, Amenophis I. (Amenhotp), fought in African countries. Thotmosis (Dhutmose) I., penetrated into Nubia beyond the third cataract, and in Syria to the Euphrates river. His minor son, Dhutmose II., reigned with his elder sister and wife, Hatshepsut (not Hatasu). After his early and, perhaps, violent death, his sister reigned 21 years alone. In one of the finest buildings of Egypt, her temple at Deir el-bahri, the great expedition to Punt is represented as the most remarkable event of her reign. Punt (*Phut* in the Bible), the southern coasts of fertile Arabia and especially the Somali coast, furnished gold, rare animals, and incense, the most valuable article for the cult. Hatshepsut first equipped, instead of single ships, a fleet which brought living incense-trees to be planted in Thebes. After her death, a half-brother succeeded, the greatest conqueror among the Pharaohs, Thotmosis (Dhutmose) III., (about 1550). His reign of 33 years saw at least 16 campaigns in Syria. In the first one, he defeated a coalition of all princes of Palestine and middle Syria at Megiddo, but many efforts afterwards were necessary to subject the strong cities in southern Libanon, Phenicia, and Kadesh, on the Orontes. Then he conquered Nah (*Naharin*, i.e., "flat Syria"), near the Euphrates, with the princes of Tunep, Khaleb, Karkamish, and set his landmark at *Ni* on the Euphrates. In northern Mesopotamia he devastated Mitanni (the *Osroene* of Roman time), where he hunted elephants, but lived in peace with Assur, Sangar, and Babel. With his rich booty he embellished the temples of Egypt more than his predecessors, who had all been great builders, and the temple of Karnak owes its splendor mostly to him. Amenhotp II. suppressed rebellions in Syria and kept the frontier at *Ni*, probably also Dhutmose IV., but Amenhotp III. lost northern Syria. The letters in cuneiform writing received from Asiatic princes, during his reign and that of his son, were found some years ago, and have thrown much light upon his diplomatic relations, especially upon those with Mitanni, whose king, Sutarna, sent his daughter with 317 female slaves to the Pharaoh. His son, by the beautiful and influential queen Tiye, Amenhotp IV. (1450) caused a great revolution by trying to replace the old mummified religion by a *solat* monotheism, and persecuted the worship of the god Amon so persistently as to obliterate

his name on earlier monuments and to change his own name containing "Amon" into "Sun's splendor" (Akhunaten). He built a new capital at Tell el-Amarna in Middle Egypt. After his death, the new religion, which had met with great opposition before, was destroyed with its monuments under the following ephemere kings (Ay, Tutankhamon). Haremheb finished the restoration of the old creed. Ramses I., the founder of dyn. 19, died soon. Sety Sethos), whose tomb in Biban el-Moluk is the finest of all, attempted to win again the northern provinces, which had fallen into the hands of the Kheta (Hittites), a people coming from Cappadocia. His son, Ramses II., or Sesostris (1380), continued, and in addition to Galilee and southern Phenicia, conquered Phenicia to the Dog's river (*Lycus*) near Beirut, defeated the Hittites at Kadesh on the Orontes (Laodicea ad Libanum), and suppressed revolting Palestine. After 20 years he made peace and married a daughter of the Kheta king. The numerous representations of the same modest victories on his monuments caused the Greeks to believe him to have been a conqueror of half the world. His activity as a builder during his reign of 67 years was beyond comparison, although he usurped many monuments, replacing earlier names by his own. Two-thirds of all monuments bear his name, the temple at Luxor, that of Abusimbel in Nubia cut into the rock, etc. He built the cities of Pitorn and Ramses, and was the king who oppressed the Israelites. Under his son, Merneptah, the Libyans devastated the western Delta, and pirates from Asia Minor and Europe its shores—the Akaywash (Acheans?), Tursh (Tyrsenians?), Shardin (Sardinians), Luk (Lycians), and Shakarush, who at that time appeared in the Orient as pirates and mercenaries. These enemies joined their armies near Heliopolis, but were defeated by Merneptah. He was the king of the Exodus, but no monuments as yet aid the difficult connection of Egyptian history with the biblical record. Dynasty 19 ends ingloriously with anarchy and the reign of a Syrian usurper. Dynasty 20 is founded by Setnakhte, whose son, Ramses III., is a feeble imitator of Ramses II. in every respect. He repelled several invasions of the Libyans, defended Egypt and the Syrian provinces against the pirates and incursions of barbarous swarms coming from Asia Minor, and plundered the country of the Amorites (at that time, 1250, between Libanon and Anti-Libanon). His palace and favorite temple was at Medinet Habu. Records of a conspiracy in his harem are preserved. The line of nine Ramessides after him seem to have reigned in peace without any remarkable event. The feebleness of the last kings caused the high priests of Thebes, who had become very rich by the donations of Ramses III., to depose them. Then a new dynasty from Tanis took the throne. Under their rather inglorious reign, the police gave up trying to protect the tombs of the preceding kings against thieves, who had already plundered some under Ramses IX. (records in a papyrus in London), and hid the mummies in an excavation where they were discovered in 1881.

Dynasty 22 (950) was of Libyan origin, because the Libyans, especially the tribe of the Mashiash as mercenary soldiers, had become so influential that their commanders were next in position to the king. Shoshenk I. (*Shishak* of the Bible) is known by his campaign despoiling the cities of India and Israel under Jeroboam and Rehoboam. Under the later kings and those of dynasty 23 (from Tanis), Shoshenk, Usorkon, and Takelot, the unity of the empire was lost. Tefnakht and his son, Bocchoris (Bekenranf), of dynasty 24 were only princes of Sais and Memphis. When the first tried to subdue the many Libyan commanders reigning in the cities of the Delta, he was stopped by king Pankhy of Napata. After B.C. 1200, Ethiopia became an independent civilized kingdom, and in dynasty 23 even conquered Upper Egypt. Bocchoris was burned alive (?) by Pankhy's second successor, Shabaka, and the whole of Egypt became an Ethiopian province (728, 25th dyn.). The vice-king of Shabaka, Sebe, united the kings of Syria against Assyria, the power of which threatened even Egypt, but the Assyrians destroyed Samaria and the kingdom of Israel (722), likewise Hamat, and defeated Sebe at Raphia. Taharka (*Tirhaka*, Bible), the successor of Shabaka and Shabataka (704), repeated this attempt, but Sanherib defeated him at Altakeh. An epidemic prevented the Assyrians from capturing Jerusalem, whose King, Hiskiah, had joined the Ethiopians, and from attacking Egypt; but Assarhaddon (671) conquered Egypt and divided it among 20 tributary princes from the old families of Libyan officers. In 668 Taharka drove out the Assyrian garrisons, and another unsuccessful attempt by his successor Tan(ut)amen (663) was not repeated. When the Assyrian empire began to decline, Psametik of Sais, an heir of the princes of dynasty 24, founded dynasty 26 (before 650), with the help of Ionian and Carian mercenaries. A large part of his Libyan troops deserted to Ethiopia. Nekao II. (609-594) began the canal connecting the Nile with the Red sea, and sent Phenician sailors around Africa; he killed Josiah of Judea and conquered Syria to the Euphrates; but lost it, having been defeated by the Babylonian crown prince, Nebuchadnezzar, at Karkemish. Apries (*Hophra*, Bible), 588-69, successor of Psametik II., was not able to prevent the destruction of Jerusalem by Nebuchadnezzar (586). A military revolt deposed him. Amosis II. (Amasis), 569-526, reigned with diplomatic skill and conquered Cyprus. His son, Psametik III. (Psamenit), reigned one year; in 525 Cambyses defeated him at Pelusium, and Egypt became a Persian province. It revolted (487) under Khabbash, in 460-50 under Inaros and Amyrteus (with Athenian aid), and more successfully about 400. Five national kings reigned; the last, Nectanebus, lost Egypt 342.

Soon Egypt became a province of Alexander, who founded Alexandria. After his

death, his general, Ptolemæus (306), assumed the title of king of Egypt. (See PTOLEMY I.) Augustus made Egypt a Roman province under a governor of equestrian rank. It remained a quiet possession; only Zenobia's conquest (270 A.D.) and Firmus' revolution (272) are to be noted. Even before the temple of Serapis in Alexandria was destroyed (391) the country was Christianized, and here gnosticism, Arianism, asceticism and monasticism (beginning already in pagan time) developed themselves. The times of the successors of the Romans, the Byzantines, were filled with sectarian troubles (between Jacobites and Melchites), which enabled first the Persians (616-628) and then, on the invitation of the Coptic governor, Makaukas, the Arabs (640) under Omar I. to enter. In 668 the Arabic governor, Akhmed, made himself independent of the caliphs of Bagdad. His family, the Toulounides, were replaced by the Akhsidides (935), these by the Fatimides (969), Moizz Eddin Allah, who built Cairo. Saladin, a Kurd, founded the dynasty of the Ayoubites (1171). He fortified Cairo, brought Egypt to great wealth, conquered Syria and successfully waged war with the crusaders, destroying the kingdom of Jerusalem.

Louis IX. of France, after taking Damietta, was captured in 1249 by the first sultan of the Mamelukes (q.v.). Baharite and Bordjite, Mameluke sultans, although conquering Cyprus in 1426, reduced the country to poverty and anarchy. The Turkish conquest (1517) by Selim I. left the power of the Mameluke chiefs nearly unchanged; the Turkish pasha was without power, and one (Ali Bei, 1763) made himself quite independent. In 1798 Bonaparte invaded Egypt and defeated the Mamelukes near the pyramids, but the French government in Egypt was expelled by the Turks with British help in 1801. Pasha Mohammed Ali (1806) murdered the Mamelukes and formed an army which conquered Nubia (1820) and parts of Arabia (1816), but lost many troops in aiding the Porte during the Greek revolution. In 1831 he rebelled and conquered Syria. In 1839 after the victory at Nisib he was about to gain the whole Turkish empire, and was only prevented by the intervention of the quadruple alliance (Russia, England, Austria, Prussia), which forced him to evacuate Syria and renew his dependency on the Porte. He did much for the country by improving the irrigation, the cultivation and the security, but nearly ruined the people by innumerable taxes and monopolies. He died in 1849, his grandson, Albas Pasha, in 1854, Saïd Pasha in 1863. These pashas again brought the country to wealth. Ismail Pasha, who first received the title *khedive* or viceroy from the Porte, did much for the construction of the Suez canal by De Lesseps, conquered the enormous provinces of the Soudan (Darfur, Harar, etc.), and promoted European culture very much. He was forced by the Porte several times to reduce his too numerous army and navy. His externally splendid government led to so miserable a state of the finances that in 1875 he sold his 176,602 shares in the Suez canal for £4,000,000 to England. In 1876 the revenue was put under the management of European commissioners; in 1878, the khedive's private property went to help the payment of the interest on the public debt. When, in 1879, he dismissed his financial minister, Nubar Pasha, and refused the payment of interest, the European governments forced his abdication in favor of his son Tewfik. This interference on the part of foreign powers, and the resulting retrenchments in the Egyptian government's expenditure, caused such discontent that a revolt broke out, headed by Arabi Pasha (q.v.), a colonel in the army. The demands of the insurgents were, that the army should be increased to its normal strength, that the prime minister of the khedive, Riaz Pasha, should be deposed, and that a chamber of notables, or national parliament, should be convened to assume the government of the people as a representative body. Riaz Pasha had in the preceding February made himself unpopular by resisting the demands of Arabi and other protesting colonels, and laying a treacherous plot for their seizure. Tewfik, alarmed by the proportions which the revolt had assumed, agreed to substitute Sherif Pasha in the place of Riaz, and to convene the chamber; but he urged that he could not increase the numerical strength of the army without the consent of the foreign commissioners. A chamber of notables was summoned, which met at Cairo before the end of the year, and, in 1882 (Jan. 4), Arabi Bey was taken into the new cabinet as assistant secretary of war. When it was found that France and England, through the controller general, were inclined to resist all the demands of the chamber that would limit foreign interference in the management of the finances, the resentment of the popular or "national" party rose to fever heat. Sherif Pasha favored the European powers. He was therefore forced to resign (Feb. 2); and a new ministry was appointed, with Mahmud Sami and Arabi Pasha at its head. But the khedive and his ministers represented such opposite lines of policy that it was evident that a rupture between them was imminent. In the middle of May the crisis came. Some Circassian officers who were favorites of the Turkish sultan had been convicted of plotting the death of the ministers. The khedive commuted their sentence of loss of rank and banishment to simple banishment. His action was violently attacked by the nationalists, but was supported by the sultan and by the controllers. England and France each sent a fleet to Alexandria, May 17, to maintain the authority of the khedive, and demanded the resignation of the ministry and the exile of Arabi. The ministers obeyed, but a popular outbreak caused the khedive to reinstate Arabi. He was now the idol of the army and the populace, who, encouraged by their success, were breathing threats of violence against their foreign oppressors. While matters were in this condition an ordinary street fight in Alexandria culminated in a general uprising of the native pop-

place against the Europeans, June 11. Arabi was commissioned by the khedive to restore order, but his known sympathy with the rioters only increased the panic of the foreign colony, which fled from the city in dismay. England and France had vainly urged the sultan to send troops into Egypt to enforce the authority of the khedive and to suppress the growing power of Arabi, who was virtually dictator of the country. As the French hesitated to act, the English took matters into her own hands. A *casus belli* was found in the fact that certain forts in the Alexandrian harbor were being armed by orders of Arabi. The English admiral, Sir Beauchamp Seymour, accordingly bombarded the town. On the next day, the insurgents evacuated Alexandria, leaving it in flames, and entrenched themselves at Kafi Dowar about twelve miles distant. The khedive sought refuge with the English fleet. He was formally deposed by the nationalists, who organized a provisional government at Cairo, and intrusted the defense of the country to Arabi. Meanwhile the English, after an ineffectual siege of some weeks, abandoned the attack on Kafi Dowar, and an Anglo-Indian army of 40,000 men was sent across the isthmus of Suez under command of Sir Garnet Wolseley. They landed at Ismailia; and advanced to Tel el Kebir, where a large army of insurgents had thrown up intrenchments. After several bloody battles they finally succeeded in storming the enemy's lines, Sept. 13. A forced march was then made on Cairo, which was reached by nightfall. Arabi at once surrendered himself as a prisoner of war, the national army was disbanded, and the khedive restored to his authority. Arabi was sentenced to death, but the sentence was commuted to exile on the island of Ceylon. Various reforms were now introduced by the English, acting through Lord Dufferin, who was appointed special commissioner to Egypt. The so-called dual control was abolished 1883, in January, in spite of the protests of France; and in February, Sir Auckland Colvin was made financial counsellor to the khedive. An army of occupation was deemed necessary for a while to preserve tranquility; but it was promised that their numbers should be steadily diminished. This promise, owing to a serious outbreak of the Arabs in the Soodan (q.v.) and the inherent weakness of the khedival government, has not yet been redeemed; and at present (1893) Egypt has practically become a dependency of England, garrisoned by English troops and with a government whose policy is in all things directed by the representative of England, though still carried out in the name of the khedive. (See the following paragraphs.)

Government.—The administration of Egypt is carried on by native ministers, subject to the ruling of the khedive. From 1879 to 1883 two controllers-general, appointed by France and England, had considerable powers in the direction of the affairs of the country (constituting the so-called dual control). In the summer of 1882, in consequence of the military rebellion just described, England intervened, subdued the rising, and restored the authority of the khedive. In this intervention England was not joined by France, and as a result, on January 18, 1883, the khedive signed a decree abolishing the joint control of England and France. In the place of the dual control the khedive, on the recommendation of England, appointed an English financial adviser, without whose concurrence no financial decision can be taken. The financial adviser has a right to a seat in the council of ministers, but he is not an executive officer.

The Egyptian ministry is at present composed of seven members, among whom the department work is distributed as follows: 1. President—Interior; 2. Finance; 3. Justice; 4. War; 5. Public Works; 6. Instruction; 7. Foreign Affairs.

On May 1, 1883, an organic law was promulgated by the khedive creating a number of representative institutions, based on universal suffrage, with a view of carrying on the government of the country in a more constitutional manner. These institutions included a legislative council, a general assembly, and provincial boards.

The legislative council is a consultative body in matters of legislation, to which all general laws are submitted for examination; but the government is not obliged to act on its advice. The functions of the two other institutions are also of a limited character; but no new direct personal or land tax can be imposed without the consent of the general assembly, which has to be summoned every two years.

Egypt proper is administratively divided into 5 governorships of principal towns, and 14 *mudirihs*, or provinces, subdivided into *kisms*, or districts.

Army.—On September 19, 1882, the whole of the Egyptian army was disbanded by khedival decree. In December of the same year, the organization of a new army was entrusted to a British general officer, who received the title of Sirdar. There are about 60 English officers serving at present in the Egyptian army. The army has a total strength of 17,000.

Since the rebellion in 1882, an English army of occupation has remained in Egypt. Its strength, January 1, 1897, was 4500. The Egyptian government contributes a large sum each year to meet the cost of its maintenance.

Population.—The population of Egypt, inhabiting a total area of 400,000 sq. m., of which only 12,976 sq. m. are cultivated, was found to be, at the last census (June 1897), 9,654,323, including 125,000 foreigners. The principal towns, with their population in 1897 are Cairo, 576,400; Alexandria, 319,767; Damietta, 43,477; Tintah, 33,725; Mansourah, 26,784; Zagazig, 19,046; Rosetta, 16,671; Port Said, 35,000; Suez, 18,068.

Religion and Education.—The prevailing religion in Egypt is the Mohammedan, but some 300,000 Copts are Christians, over whom preside the Patriarch of Alexandria, three

metropolitans and 12 bishops. In 1895 there were about 9000 schools and 11,000 teachers. In most of these schools education is confined to the elementary branches.

Commerce and Finance.—In 1896 Egypt imported goods to the value of \$59,373,490, and exported products valued at \$46,330,000. Her chief product and article of commerce is cotton. In 1889 out of 3781 villages, 2685 were occupied in the culture of cotton.

The total debt of Egypt, Jan. 1897, was \$508,000,000. The budget for 1897 shows a revenue of \$51,000,000 and an expenditure of \$50,000,000.

Ancient Egyptian Language and Literature.—Egyptian was a branch of the Hamitic family of languages, connected with all the dialects of the light race of northern Africa, and it is incorrect to regard it as though nearer related to the Semitic family, since those African languages are known only in the form of 19th century Egyptian on monuments 5000 years old. This earliest branch is thus the link connecting the Semitic and Hamitic families and showing that they had one root. It is in about the same degree of development as the Semitic languages, having passed the agglutinative state; and only the peculiar kind of writing has induced many to believe it a monosyllabic and very simple tongue. The hieroglyphs express (as do the different Semitic systems of writing, except Assyrian) only the consonants of every word; the vowels are to be supplied by the reader, and therefore modern scholars disagree very much in their transcriptions. The language underwent many changes during its long history, and the difference between the archaic style and the living language became so great about 1400, that the popular style is called Neo-Egyptian as a special language. Later inscriptions, however, mostly are bad imitations of the earliest language. The hieratic writing is only a cursive and easy form of the hieroglyphic, used in daily life and in secular literature. After 700, the cursive forms developed a kind of shorthand, the Demotic, which is often wrongly called the popular dialect, although it is a style of writing and not a language. This stenography was in common use for papyri in the time of the Ptolemies and Romans, and therefore it was called "the popular writing" (*demotic*). The most recent demotic text dates from the 5th century B.C., an hieroglyphic inscription of 250 B.C. Christians wrote the language in its earliest form with Greek letters, adding five new letters and a syllabic sign, and this dialect was called *Coptic*, i.e., *Egyptian*, by the Arabs. The Coptic had a literature nearly exclusively religious. As a living language it died out some centuries ago, and now the Copts read their prayers without understanding them. The early literature was very rich, as can be seen from its many fragments. After the magic texts copied on the walls of the tombs, the *Book of the Dead* (q.v., under DEAD) is the earliest and most remarkable religious work, a collection of hymns and magic formulæ, serving as guide-book for the lower world, describing its stations, and giving magic protection against its dangers. Although the text in the form published by Naville, from manuscripts of the 17th to the 12th century B.C., is corrupted to senselessness, it never was very rich in thought. In general, all philosophical literature is wanting. Contrary to expectation entertained before the decipherment of hieroglyphics, collections of moral rules (*pap. Prisse, Prescriptions of Ani*) show no philosophic ideas. Many magic and ritualistic texts are found in the tombs, but the current literature consisted mostly of short tales and historic novels, being often pretty and fanciful. Love songs also have been found. Egyptian science bears, as has been said, a merely practical character. A short school-book on mathematics has disappointed expectation, as medical papyri have also done. The largest one (*pap. Ebers* in Leipzig, written about 1600 B.C.) shows at least little knowledge of anatomy. Many letters, acts, and deeds still exist. The larger papyri are mostly copies written in schools for practice. The classic style, of Dyn. 12, imitated in most poetical works, is not clear and simple enough for modern taste. The masterpiece of epic style, the song of Ramses II.'s victory at Kadesh, is too long and without action. Also the demotic papyri contain many copies of earlier books, tales, poems, etc. In general the literature is equal to most oriental literature, but without those features of learning and wisdom which the Greek writers lead us to expect.

Ancient Religion.—The religion of Egypt grew from a low kind of fetishism. Every village in prehistoric time had its own god or demon, worshiped in an object, a tree, or an animal. The towns united the gods of the surrounding places into one family, bringing them into relation with the town deity. Thus every town-god has a "divine circle" around him. Very soon solar worship began, Re probably being the earliest god. But his name was not accepted everywhere, several local deities also being identified with the sun. Horsus became a most general form of it; in Heliopolis the sun was called Atum; in Hermonthis, near Thebes, Montu, etc. Osiris, the local god of Abydos, thus became the setting sun, the ruler of the lower hemisphere, consequently the god of the region of the dead, and in this character, the most popular god of Egypt. As all local gods, with or without connection with the celestial phenomena, remained, and later were worshiped in the whole country, and none of the different sun-gods replaced another, the confusion which we find already in the earliest texts makes it impossible to construct any system. The Egyptians attempted such constructions very soon, but their families and genealogies of the gods, their identifications of one god with another (very few gods failed to receive a solar character in later times), or division of the natural forces among the gods, only increased the confusion. After the reformation of Amenophis IV., introducing a solar monotheism, had failed, the people

remained in an indescribable degree of uncertainty in religious belief, to which only the myth of Osiris gave some life. The religious movements among the priests did not touch them. These movements had led remarkably towards monotheism and a higher conception of the divinity before that revolution. Suppressed for some time, they ended in magic superstitions. Pantheistic ideas, which necessarily sprung up from the identifying systems, found their extreme after 600 and later. The principal and most popular personalities of the innumerable pantheon are: Osiris, worshiped especially at Abydos, and Busiris. Isis appears as his sister and wife, Horus (the young, i.e., rising sun), who had his most famous temple at Edfu, as his son. Nephthys, his other sister, is married to his brother and murderer, Set (Typhon). The shacal Anubis, the guardian of the inferior region, is a son of Osiris and Nephthys. Set, originally a personification of the earthly powers opposed to the sun, then of all irregularities in nature, later of everything violent, therefore also of war, after 1000 B.C. became a Satan. The parents of these four gods are Seb or Keb, and Nut, who are explained as earth and heaven. The parents of these are Shu, the æther, and Tefnut (emanation?), while the father of all the gods is Nu, the abyss (other personification Nun or, as woman, Nunet). The ibis Dhoute has become a moon-god and father of sciences, similar to the Greek Hermes. Ptah of Memphis is considered as a creator of the world, being a workingman and artist (Hephæstus). The cow-formed Hathor, whose principal temple was at Dendera, finally received the attributes of a love-goddess. At Thebes, we find Amon, after 1600 the general protector of Egypt, and with him Mut and Khonsu; at Eileithyia, goddess Nakhbet, to whom corresponds Udjoit (Buto), in the Delta; at Sais, the Libyan goddess Neit; in the Fayum, the crocodile Sobk (Souchos); the cat Ubastet (Bast) in Bubastos; the ithyphallic Min at Chemmis; at Elephantine the ram Khum (Chnuphis) and the goddesses Anuket and Satet; at Memphis, the god of medicine, Imhotp; etc. Under the New Empire many Semitic gods were introduced as: Baal, (Rashpu)=lightning, Bes,=Astarte, Anat, Kadesh. Many gods, as Khepre(r), another creator of the world, and many genii of the lower world, had no local worship. The animals worshipped as gods even in latest time were the bulls Apis at Memphis, Mnevis at Heliopolis, Bachis at Hermonthis, and the goat Mendes. Other animals were sacred to particular gods—everywhere the cat, in some places dogs, etc.—but were no incarnation of gods as those named above.

Ancient Inhabitants and their Culture.—Language and anatomy show that these belonged to that branch of the Caucasian race which inhabits northern Africa, and represented this race very purely in most ancient time, only later receiving some negro blood. Already in Dyn. 4, they appear perfectly civilized. Art and architecture were at their full height; the state was well organized. But the power of the country was in the hands of a few noblemen, and the whole of the population seems to have consisted of serfs. Only in the Middle Empire, a middle class of priests and scribes becomes remarkable. During the New Empire the princes of provinces were replaced by officials appointed directly by the crown. Military officials had precedence over priestly ones, as in that time of conquest the soldiers had gained the leading part in the state. However, the Egyptians themselves were not warlike, and from earliest times depended upon foreign mercenaries. Although in soldier-families the connection with the army commonly was inherited, the Greek reports concerning the division of the people into priests, warriors, and three or four other "classes" must not be mistaken for castes like those of India. There existed no restriction concerning the choice of business or intermarriage of classes. Education was rather common, although, of course, clerical offices and studies mostly remained with the priests. The commercial activity of Egypt was very great, but in the north soon passed into the hands of the Phenicians, because of the Egyptian disinclination to maritime sailing. The well-developed manufactures furnished material for exporting. It must be remarked that iron was always known and used, but that tools and weapons mostly consisted of bronze or copper, and stone implements were still in use after B.C. 2000. As money, metal in rings was used at least after B.C. 1600. The greater part of the people were devoted to agriculture. Although working with primitive means, they knew how to make their labor very successful, for Egypt had far more numerous a population than now (over 7,000,000 under Nero). The Egyptians were by no means a grave and philosophic people, but gay, and show us enough of their entertainments and pleasures, such as hunting, fishing, music, dancing, and many plays. They were also less sober than other oriental peoples, drinking much beer (less wine), and were hardly more moral than the Greeks. We cannot even say that they were religious, only many superstitious ceremonies and the great care bestowed upon the life after death led foreign peoples to believe this. The mummification was at first a privilege of the highest classes; later it was cheaper, and therefore general. Much expense was devoted to the equipment of the dead, their protection by talismans and magic papyri in the tomb, and the sacrifices for their souls. After B.C. 2000 the cult of the defunct lost something of its interest. On the contrary, the priests after that time gained more and more in property and influence, which was reduced only by the Ptolemies. The absolute power of the king, who enjoyed divine honors, was limited first by the counts (nomarchs), and then by the priests, and their foreign guards. The poor condition of the agricultural class, the serfs of the king or other great land-owners, was hardly changed during the whole history of Egypt. Justice was well developed, even modern

juries having their precedents in Egypt. The legal independence of the women is most remarkable. The wife was in property perfectly equal to the husband. Polygamy existed, but was rare. Marrying the sister was almost a common custom. In general, Egyptian civilization resembles the modern more than that of any oriental peoples.

Art of Ancient Egypt.—Sculpture and painting were bound by the canon of proportions, and the great conventionality of this caused stiffness, especially in the representations of human figures. The style was most free before 3000 B.C., and the finest works of Egyptian art (statues and bas-reliefs) date from that time. Although later art has left remarkable works, it did not follow any new and original direction. The reformation of Amenhotp IV. (1450), caused also a revolution in art and led to a most naturalistic tendency, favoring even the ugly, but disappearing with that king. The representations covering large walls and the architectural use of sculpture may have been developed a little later, but all originality was lost; also the "renaissance time," during Dyn. 26, produced only elegant imitations of the earliest art. Later, art sank to a very low degree. At all time, the manual skill of the Egyptians in cutting the hardest stones is admirable; we know that besides very imperfect tools, diamonds were also used. Also the architectural use of sculptures, in the brightest colors, is of high perfection. These sculptures are mostly bas-reliefs worked not out of the wall but in it, and not prominent but deepened (intaglio). All representations of animals are less stiff by the canon of forms, and are therefore good and naturalistic. A humorous tendency (caricatures have been preserved) is remarkable in most sculptures. Painting had only an architectural character; neither perspective nor shadow were observed. The art of casting bronze statues was known in the earliest times, likewise the manufacture of glass and of that glazed pottery which is erroneously called Egyptian porcelain. The influence of Egyptian art upon that of all nations of western Asia was very strong. Their music seems not to have reached a higher degree of excellence, though a great variety of instruments are represented.

The Architecture of Egypt was at first very simple, but it seems that at least before B.C. 2000 most of the different architectural forms were developed. The inclination of the walls thickened below on the outside, always remained the primitive style. All decorative forms were derived from the vegetation of Egypt, the lotus flower and button, the palm branches, the papyrus. The columnar forms imitate the same models, but the proto-doric columns of Beni-Hassan (2500 B.C.) and other forms show how much Greek art has borrowed from Egypt. Among architectural figures, the sphinx takes the first place. When used in alleys to protect the roads leading to the temples, it changed often with figures of rams or lions. All temples consisted of a shrine before which a number of rectangular courts, colonnades, halls, and pylons or tower-like door-buildings were constructed. Towers were not constructed with them. The arch was known but rarely used; enormous stones supported by pillars formed the temple roofs. Whether the gigantic blocks, hardly mastered by modern engineers, were moved by skillful machinery is doubtful; the combined forces of thousands seem to have placed them. The character of the private architecture was opposed to the solidity of the public buildings, light structures of wood and sun-dried bricks, of which no durability was expected. (See OBELISK, PYRAMID, SPHINX.)

For the monuments of Egypt see as references, Rosellini, *Monumenti* (1832-44); Champollion, *Monuments* (1835-45); Lepsius, *Denkmäler* (1849-58). For the history (no book in English is reliable), Maspero, *Histoire des Peuples Orientales*, 2d ed.; E. Meyer, *Geschichte Aegyptens*. For the manners and customs, Wilkinson, 2d ed. (1879); better, Erman, *Aegypten* (1885). For the religion, Lepage-Renouf, *Lectures* (1880). For the language, the dictionary of Brugsch (1867-80). No grammar has been written which is reliable: Lepage-Renouf (1875); better, Brugsch's *Grammaire Hiéroglyphique* (1872); Loret, *Manuel* (1887); two grammars of special periods by Erman (prof. in Berlin). Much material is found in *Zeitschrift für Aegyptische Sprache*, *Recueil des travaux*, *Proceed. of the Soc. of Biblical Archaeol.*, and *Papers of Egypt. Exploration Fund*. The most important inscriptions translated are in *Records of the Past* (London, 1874-79), but only the 2d edition can be recommended. For the art, Perrot and Chipiez, *History of Art*, and Maspero, *L'Archéologie Egyptienne*. For the modern conditions, a large number of traveler's day-books published yearly have not yet furnished anything equal to Lane, *Modern Egyptians* (1842). For statistics, see the *Statesman's Yearbook* for 1893.

EGYPTIAN MUSIC. Information regarding ancient Egyptian music is extremely meagre. Herodotus describes a festival in Bubastis, on which occasion "men and women embark together in great numbers. During the voyage some of the women beat upon small drums, while some of the men play on the flute. The rest of the people of both sexes sing, clapping their hands together at the same time. . . . Among other memorable customs the Egyptians sing the song of Linus, like that sung in Phenicia, Cyprus, and other countries, where it bears a different name. But the person they praise in this song is evidently the same whom the Greeks celebrate under the name of Linus. The Egyptians call him Maneros, and they say that he was the only son of the first king of Egypt. Happening to die in the prime of life, he is universally lamented by the people in this dirge, which is the only song of the kind in Egypt." The Egyptian hymns are thus described in the *Introduction to the Study of the Egyptian Hieroglyphs*, by Samuel Birch (London, 1857): "Plato speaks of the hymns of Isis.

which were apparently in the form of colloquies. Certain books which passed under the name of those of Horus and Isis are spoken of by Lucian. There were also ancient lyrical poems containing the praises of the gods and ancient heroes, and sung at ceremonies and entertainments, and deaths, when threnes, or funeral dirges composed in rhythm were chanted for the deceased. Among the encomiastic odes is mentioned one in the honor of Sesostris, which differed from the historical accounts. Hymns were also addressed to the rising and the setting sun, and to Ammon, to obtain his oracular responses to the Oasis. Of these the most important were the *threne*, i.e., the dirge, or lament for Maneros; another, addressed to Saturn; and a chant called the Genethlia, or Birth of Horus." The instrumental accompaniment to the singing of the men and women consisted of a lyre, a harp, and a double-pipe. A combination of flutes is represented on one of the tombs in the pyramids of Gizeh, and dates, according to Lepsius, from the 5th dynasty. Instruments were combined variously for orchestral music. In martial music instruments of percussion were employed. The Egyptians had no notation, and preserved their music in hieroglyphs. The song of the oxen treading out the corn is one of the oldest metrical poems of the Egyptians.

The Egyptian instruments known through sculpture, painting, and well-preserved specimens, are the harp, the trigonon, the lyre, the tamboura, pipes, flutes, double-pipes, trumpets, drums, tambourines, the sistrum, crotala, cymbals, bells, and curious stringed instruments, and instruments of percussion. The harps varied greatly in size, shape, number of strings, and in decoration. While performing, the player stood, knelt, or supported his instrument upon a stand. Of the scale to which these harps were tuned no reasonable idea can be formed. The Egyptian name for the harp was *buni* or *beni*. The most elaborate specimens of the Egyptian harp were found by the traveller, James Bruce, painted in fresco on the wall of an ancient sepulchre, at Thebes, supposed to be the tomb of Ramses III., who reigned about 1250 B.C. The *trigonon* was a triangular-shaped harp, resembling the lyre. A curious semi-circular instrument of this kind was discovered in Thebes in 1823. Its wooden frame was covered with red leather, and it was mounted with twenty strings of catgut, which still emitted sound when made to vibrate. In the ancient Egyptian trigonon the front bar, which would complete the triangle, is wanting. The lyre of the ancient Egyptians varies in shape and in the number of strings. Some resemble the Assyrian lyre; some were held perpendicularly when played upon, and others horizontally. The frame was frequently ornamented with the carved head of the horse, gazelle, or some favorite animal. The harps and lyres are supposed to have been tuned in the pentatonic order, without the addition of foreign intervals. The body of the tamboura was either oval or with the sides curved inwards, like the violin or guitar. Some instruments had four pegs, some only two, and in the representations of others these are left out, either through carelessness, or because they were situated under the neck. The tamboura was played with a plectrum, and sometimes was provided with frets. Its Egyptian name was *nofre*, and signifies "good" in the hieroglyphs. The instrument seems to have been held in high estimation, for its figure is found on vases and on other pottery. The Egyptians had another kind of tamboura, resembling our modern guitar, and the Arabian 'ood. The stringed instruments differed so much from our own that it is difficult to class them. These have been discovered in various states of preservation in tombs, and on hieroglyphs, and in paintings. They are of wonderful variety. Small pipes of reed with three, four, five, or more finger-holes have been discovered. In some pipes pieces of thick straw served the purpose of the so-called reed in our modern clarinet and oboe. The double-pipe was a favorite instrument. Its name was *mam*. A fragment of an Egyptian fresco painting in the British Museum represents a woman playing the double-pipe, while other women clap their hands in rhythmical accompaniment, and others dance. The ordinary flute, called *sêbi*, was very long. It was made of wood or reed. The various instruments of this order differed in length, dimension, and in the number of holes. The flute and single-pipe were played almost exclusively by men, and the double-pipe by women. Similar varieties of the flute exist in modern Egypt, and are called *nay*. The common *nay*, known as the "dervish flute," is used to accompany the songs of the dervishes at their religious dances. The trumpet was usually of brass, and of different shapes. There were three kinds of drums. A small hand-drum, still used in Asiatic countries, was two or three feet long, braced by cords, covered with parchment, hung in front of the performer by means of a band, and beaten on both ends with his hands. The second kind, found in Thebes, in 1823, was barrel-shaped, over a foot high, and two feet broad, beaten with slightly curved drumsticks, having knobs on their ends. The third drum is almost identical with the *dar abukkeh* of the modern Egyptians. The tambourine was either round, like the modern one, or of an oblong-square shape, slightly curved on the four sides. Sometimes a bar divided it across the middle, making it a double tambourine. Women appear to have played it more than men. The other instruments of percussion were various species of gongs, and the *sistrum*, a bronze frame of peculiar shape, and carried by women at religious performances. Another curious instrument was used to mark the rhythmic effects, like the *crotala* of the Greeks. This consisted of two balls, or knobs, sometimes carved in the shape of human heads, to which were affixed handles. One of these was held in each hand, and struck together to mark the time in religious performances and dances. The Egyptian cymbals

resembled our own in shape. They were made of bronze and brass, and sometime with an alloy of silver. Small bells of bronze were also known to the Egyptians. On some of them the head of Typhon, the evil spirit, is represented. These have been found in tombs, and necklaces of gold and silver are often made in imitation of little bells. The modern Egyptians are fond of music, but regard the study of this art as unworthy of serious attention. Their natural love for it is shown by the universal custom of laborers, boatmen and country people singing while at their work. Men and women are employed to sing at fêtes and entertainments. They have a variety of musical instruments. Those in most general use are: the *kemengeh*, *kánoon*, 'ood, and the *nay*. The *kemengeh* is a kind of viol. Its name is Persian, meaning bow-instrument. It is usually about 38 inches long; the sounding-body is of a cocoanut pierced with holes, over which is stretched a piece of fish-skin, on which rests the bridge; the neck is cylindrical, of ebony inlaid with ivory; the head is of ivory, and the two strings are of horsehair and gut. The bow is made of wood and horsehair. The *kánoon* is a species of dulcimer about 39 inches long and 16 broad. It is of wood with gut strings, three to each note. It is played with two plectra, one on each hand of the performer, who holds the *kánoon* upon his knees. The 'ood is a lute played with a plectrum. It is one of the oldest Arabian instruments, celebrated by numerous poets. It is held like the guitar, has seven strings of gut, and the plectrum is a slip of vulture's feather. The *nay* is a specimen of flute. It is usually 18 inches long, pierced with holes. The other instruments include tambours, tambourines, and various stringed and wind-instruments. The singing of the sailors on the Nile has frequently been noticed. It usually consists of solo and chorus, and varies with the nature of the occupation in which the men are engaged. Certain airs are sung when the sails are shifted; others when the boat is set afloat; others when it runs aground, etc. See Chappell's *History of Music* (London, 1874); Engel, *Study of National Music* (London, 1864); Forkel, *Geschichte der Musik*; and Edward William Lane, *Modern Egyptians* (London, 1842).

EGYPTIAN QUESTION, THE, was the outgrowth originally of the reckless extravagance of Ismail Pasha in his mania for internal reforms. Upon his accession, in 1863, the Egyptian debt was \$16,000,000; in 1879 it had risen to \$500,000,000. To meet this, and provide funds for his vast undertakings, in 1875 he sold 177,000 shares in the Suez Canal for \$20,000,000, and had also, at various times, negotiated loans with both English and French banking houses at exorbitant rates of interest. The condition of Egyptian finances became so hopelessly involved that several prominent English financiers were sent to Egypt to arrange a solvent system. In 1880, after many delays, a dual English and French control was established. Ismail had also promised a constitutional government, and failing to fulfill this, these European powers insisted upon his being deposed by the Sultan in favor of his son, Prince Tewfik, who was proclaimed Khedive in June, 1879. This latter intervention was based upon a sort of protection that England and France have exercised over the dynasty of Mehemet Ali since 1841. So much interference from foreign powers caused much discontent, and the result was a revolt, in 1882, headed by Arabi Pasha (q.v.). See also EGYPT. The Sultan had been urged without success to send troops to uphold the Khedive. He failed to do anything, and so English and French warships were sent for the purpose. Then came the massacre of Europeans in Alexandria, and the subsequent bombardment, in which the French hesitated to take part; neither did they co-operate with England in the re-adjustment of Egyptian affairs, and so, in 1883, the so-called dual control came to an end, in spite of the protests of France. Since this time, Egypt has been in everything but name a dependency of England, the French in the mean time trying to resume their share in its control, and sustained in their endeavors by Russia. They have even asked the Sultan to interfere and order the English from the country, but in August, 1891, a naval demonstration was made in the bay of Alexandria, as if to show that the English did not mean to discontinue the occupation.

EGYPTIAN VULTURE. See VULTURE.

EGYPTOLOGY. The study of the language, art, and antiquities of Egypt, especially of Ancient Egypt. One who engages in such study is technically known as an *Egyptologist*.

EHNINGER, JOHN WHETTON, born N. Y., 1827; a graduate of Columbia college, and pupil of Couture, the French painter. Among his works are "Portrait of Peter Stuyvesant;" a study from Irving's "Knickerbocker's History of New York;" "Love me, Love my Horse;" "The Sword;" "The Foray;" "Lady Jane Grey;" etchings for Hood's "Bridge of Sighs;" for Longfellow's "Miles Standish;" etc. D. 1889.

EH'RENBERG, CHRISTIAN GOTTFRIED, one of the most distinguished naturalists of Germany, was b. April 19, 1795, at Delitsch, in Prussian Saxony. Although he had been originally intended for the clerical profession, he early relinquished the study of theology in favor of medicine; and after having attended the classes at the medical faculty at Leipsic for two years, he removed in 1817 to Berlin, where he graduated in medicine in 1818. His favorite study at this period was botany, and his earliest publica-

tions are devoted to botanical subjects, and more especially to such as demand the use of the microscope—an instrument with which the name and reputation of E. must ever remain inseparably associated; for to him belongs the merit of having rescued it from the discredit into which it had fallen, and of having been one of the first fully to appreciate its capabilities. In 1820, E. accompanied his friend Hemprich on his travels to the east; and after having visited Egypt, Syria, and Arabia, returned, in 1826, to Berlin, where he was appointed to one of the medical chairs of the university, which he occupied until his death. The three years which intervened before he again set forth on a scientific expedition, were devoted to the arrangement and classification of some of the abundant materials which he had accumulated in his eastern travels; and to this period belong the composition of his *Akalephen des Rothen Meeres*—which has largely contributed towards our knowledge of the medusæ—and his *Symbolæ Physicæ*. In 1829, E. accompanied G. Rose and A. von Humboldt on an expedition to the Ural and Altai mountains, in the course of which he collected materials for his numerous memoirs on the Infusoria, and for his great work *Infusionsthierchen*, published at Leipsic in 1838, which have identified his name with the history and study of this department of animal life. E. divided the infusoria into rotatoria (now found to belong to higher orders of animal life) and polygastrica, which correspond more nearly with the infusoria as now admitted, although many of his polygastric organisms have been found to be vegetable structures, and some to be the larval forms of worms, etc. E.'s researches have not been confined to living organisms, but include fossil infusoria; and his great work, *Mikrogeologie*, on the application of the microscope to geology, contains the results of his investigation in this department of inquiry. E. was a member of most of the scientific bodies of Europe, and was for nearly fifty years an active contributor to the scientific literature of his country. He died Sept., 1876.

EHRENBREITSTEIN (Honor's Broad Stone), a t. and fortress of Rhenish Prussia, is picturesquely situated on the right bank of the Rhine, directly opposite Coblenz, with which it is connected by a bridge of boats. The town of E. has several mills, a tobacco-manufactory, a flourishing trade in wine, corn, and iron, two cattle-markets, and four annual fairs. Pop. '90, 5281. The fortress of E. occupies the summit of a precipitous rock 490 ft. high, and has been called the Gibraltar of the Rhine, on account of its great natural strength and its superior works. On three sides the fortress is so precipitous as to be perfectly inaccessible; on the fourth and only approachable side, the n. w., it is fortified by three successive lines of defenses, one within another. It is defended by 400 pieces of cannon; has cisterns capacious enough to hold a supply of water for three years, and a well sunk 400 ft. deep in the rock, and having communication with the Rhine. E. was besieged in vain by the French in 1688, but fell into their hands in 1799, after a siege of 14 months. Two years after, the French, on leaving E., at the peace of Luneville, blew up the works. It was assigned, however, to Prussia by the Congress of Vienna in 1814, and under that country was restored and thoroughly fortified, but it has ceased to be of importance as a fortress. It is capable of accommodating a garrison of 14,000 men, and provisions for 8,000 men for 10 years can be stowed in its vast magazines. The view from the fortress, which comprehends a considerable portion of the course of the Rhine, including its confluence with the Moselle, is picturesque in the highest degree.

EIBENSTOCK, a t. of the kingdom of Saxony, in the circle of Zwickau, and 16 m. s.s.e. from Zwickau. It stands in a high and bleak district. It has extensive manufactures of chemical products, muslins, lace, tobacco, and tinware, and a considerable trade in cattle. Medicinal plants are very extensively cultivated. Pop. '90, 7166.

EICHBERG, JULIUS, b. Germany, 1824; educated in the conservatory at Brussels; musical director in Germany and Switzerland. In 1856, he established a musical conservatory in Boston, Mass., where he was for several years teacher of music in the public schools. He has written *The Doctor of Alcantara*; *The Rose of Tyrol*; and other operas. He d. in 1893.

EICH HORN, JOHANN GOTTFRIED, one of the most distinguished scholars produced by Germany, was born at Dörnzimmern, in the principality of Hohenlohe-Oehringen, in 1752, and studied at Göttingen. He first became rector of the school of Ohrdruff, in the duchy of Gotha, afterwards, in 1775, professor of oriental languages in the university of Jena, and in 1788 removed to Göttingen in the like capacity. Of this university he continued a distinguished ornament till his death in 1827.

His scholarship was almost universal, and he has left numerous treatises on a multitude of subjects, both ancient and modern, classical and oriental, but he is chiefly known in this country as a Biblical critic, and a chief of what is called the rational school. E. examined the Scriptures from an anti-supernatural point of view, but applied to their elucidation and criticism an unrivaled knowledge of oriental and Biblical antiquities. Miraculous appearances recorded in the Bible are held by him to be explainable as natural events, and everything is to be brought to the test of reason. Rationalism in this form can hardly be said to exist now, even in Germany; but some of E.'s views as to the historical origin of the canonical gospels have been extensively adopted. His chief works on this subject are a *Universal Library of Biblical Literature* (*Allgemeine Bibliothek der Biblischen Literatur*, 10 vols., Leip. 1787-1801); an Intro-

duction to the Old Testament (*Einleitung in das Alte Testament*, 4th ed. 5 vols., Gött., 1824); an Introduction to the New Testament (*Einleitung in das Neue Testament*, 5 vols., Gött., 1824-27); and an Introduction to the Apocryphal Writings of the Old Testament (*Einleitung in die Apokryphischen Schriften des Alten Testaments*, Gött., 1798). In a work entitled *Primitive History (Urgeschichte)*, 2 vols., Nürnberg, 1790-93, he subjects the Pentateuch to bold criticism. His last work was a History of the House of Guelf, which he traces back to the 5th c. (*Urgeschichte des Hauses Welfen*, Han. 1817).

EICH STADT (earlier AICHSTÄDT, Lat. *Aureatum*, *Arborfelix*, or *Dryopolis*, the last signifying the same as Aichstädt—viz., Oak-town), a t. of Bavaria, is situated in a deep valley on the left bank of the Altmühl, about 40 m. w.s.w. of Regensburg, in lat. 48° 53' n., long. 11° 11' east. It consists of the town proper, with four suburbs, is well built, and has several fine squares, one of which is adorned with a fountain and a statue of St. Wilibald, the first bishop of Eichstadt. Among the notable buildings are the palace of the duke of Leuchtenberg, containing a museum of antiquities and some good portraits; the cathedral, founded in 1259, an imposing Gothic structure, with monuments in bronze and marble, good paintings, and fine painted glass; the town-house (1444), with a square tower; and the Wilibaldsburg, or castle of St. Wilibald, built on an eminence 1200 ft. high, and lately used as a barracks. The manufactures are woolen and cotton fabrics, ironmongery, and the preparation of lithographic stones obtained from quarries near by; there are also breweries, and several mills. Pop. '90, 7475. E. is of Roman origin, and in 908 was surrounded by walls. The bishopric of E. was founded as early as 745. E. came into the possession of Bavaria in 1805. In 1811, Eichstadt, along with the landgraviate of Leuchtenberg, was bestowed upon Eugène Beauharnais, duke of Leuchtenberg, but reverted to Bavaria in 1853.

EICHWALD, EDUARD, a Russian naturalist, was b. at Mitau, in Russia, 4th July, 1795, and studied the physical sciences and medicine at Berlin, 1814-17. After spending some years in travel, he returned to Russia, and in 1823 was appointed professor of zoology and midwifery at Kasan. In 1827, he accepted a call to Wilna as professor of zoology and comparative anatomy; and in 1838 he went to St. Petersburg as professor of mineralogy and zoology. E. was also a great traveler for scientific purposes; since he investigated the shores of the Caspian sea, the Caucasus, Persia, Germany, Switzerland, and France, traveled over the greater part of Russia, including the Scandinavian provinces, and in 1840 made a geological journey through Italy, Sicily, and Algeria. He has unquestionably been of more service to Russia by his geognostic, botanical, and zoological researches than any man since Pallas. His principal writings are *Zoologia Specialis* (Wilna, 1829-31), *Plantarum Novarum quas in Itinere Caspio-Caucas observavit, Fasciculi* (Wilna and Leip. 1831-33), *Travels to the Caspian Sea and the Caucasus* (Stuttg. (1834-37), *Memoir on the Mineral Riches of the Western Provinces of Russia* (Wilna, 1835), *Paleozoic Russia* (1840), and in 1851, *The Paleontology of Russia* (St. Petersburg, 1851). E. was a member of all the Russian, and of many foreign academies. He d. 1876.

EIDER, a river of n. Germany, forming the boundary-line between Schleswig on the n., and Holstein on the south. It rises 12 m. s.w. of Kiel, flows first n.w., then in a general westward direction, though with many windings, and enters the North sea at Tönning, its total length being 117 miles. It is navigable as far as Rendsburg, from which town the Schleswig-Holstein canal stretches e. to Kiel fiord, on the shore of the Baltic, thus establishing water-communication between the North and Baltic seas.

EIDER, or EIDER-DUCK (*somateria*), a genus of oceanic ducks, having the hind-toe furnished with a deep lobe, and the bill swollen and elevated at the base, and extending up the forehead, where it is divided down the middle by an elongated projection of feathers. The tertials are elongated, and fall down over the wing. This genus is further characterized by the very abundant development of a fine elastic gray down, particularly on the breast, the valuable *eider-down* of commerce.—The COMMON E. (*S. molleissima*) is intermediate in size between a common duck and a goose; not much exceeding the common duck in entire length, because of the comparative shortness of the neck, characteristic of the oceanic ducks, but being about twice its weight. The male is larger than the female; and in the breeding season, has the under parts black, the upper parts and the neck white, the crown of the head velvety black, the cheeks greenish white. After the breeding season, the white color almost disappears from the upper parts, and gives place to black, without change of feathers. The female is of a pale-brown color, tinged with red, and varied with transverse marks of dark brown. Young males at first resemble the females, and do not acquire the full adult plumage till their third winter. The young are termed brattocks in many parts of Scotland. The E. is an inhabitant of the northern parts of the world, abounding on arctic and subarctic shores, and becoming rarer in more southern and temperate regions. It is merely an occasional winter visitant in the middle latitudes of Europe, and the Fern islands are its most southern breeding-place on the British coast. In North America it seldom breeds further s. than the bay of Fundy. Great numbers breed on the coasts of Labrador and more northern parts of America, where hitherto the gathering of the down has been generally neglected; but in Iceland and Norway the breeding-grounds of eiders are carefully protected, and are transmitted as valuable inheritances from father to son. Cattle are sometimes removed from islets, in order to induce the eiders

to settle upon them, and a strict watch is kept against dogs and foxes. Promontories are sometimes even formed into artificial islets, on the same account, as the E., like many other sea-birds, prefers islands for its breeding-places, probably on account of their greater quiet and security. The nest is formed of fine sea-weeds, mosses, and dry twigs, if they are to be had, matted and interlaced. The eggs are usually five, sometimes six or seven in number, about 3 in. long, and fully 2 in. broad, of a uniform pale green: they are at first deposited without any down, but as incubation proceeds, the mother strips the down from her breast, and places it about them. By it they are kept warm when she at any time has occasion to leave them, but it seems to be indispensable to their being hatched; for if the eggs and down are removed, and if this is done a second time, so that the female cannot afford a further supply, the male comes and contributes for the third set of eggs the down of his breast, which is of a paler color. The common practice in Norway and Iceland is to take away the eggs and down twice, leaving the third set of eggs to increase the number of the species. The eiders of the Icelandic and Norwegian breeding-grounds show so little alarm at the approach of visitors that the females will permit themselves to be touched as they sit on their nests, the males moving about close beside them, but agitated and disturbed. The nests are often placed so close together that great care is necessary in walking among them to avoid trampling upon them. In the islet of Vidöe, a valuable breeding-ground near Reikiavik, the capital of Iceland, almost every little hollow place between the rocks is occupied by the nests of these fowls; they readily take possession of holes cut for them in rows in the sloping side of a hill; nay, garden-walls and the interiors of buildings are in like manner occupied. In Orkney and Shetland the E. is commonly known by the name of dunter-duck.

The E. is sometimes called **ST. CUTHBERT'S DUCK**, from a rock called St. Cuthbert's isle, one of the Fern islands. It seems probable that, with due care, the number of the eiders at the Fern islands, and some of the Scottish islands, might be greatly increased, and their down yield a considerable revenue; but at present their eggs are indiscriminately taken with those of other sea-birds, and no protection is extended to them. The eggs are remarkably fine. The flesh of the birds, also, is not unpleasant, and is said to become of superior excellence when they are partially domesticated, and when farinaceous food is mixed in considerable quantity with their natural diet of marine mollusks, crustaceans, etc. The complete domestication of the E. has been successfully attempted.

About half a pound of eider-down is said to be annually obtained from each nest, but this is reduced by cleaning to a quarter of a pound. The elasticity of the down is such that three quarters of an ounce of it will fill a large hat, although two or three pounds of it may be pressed into a ball and held in the hand. Its extensive use, particularly in Germany and other parts of the continent of Europe, for stuffing the bed-coverings, which there usually supply the place of blankets, etc., is well known. The down taken from birds which have been killed is inferior in quality to that obtained from the nests. The latter is known in commerce as *live down*, the former as *dead down*.

The **KING EIDER**, or **KING DUCK** (*S. spectabilis*), also yields no inconsiderable part of the eider-down of commerce, especially of that which is brought from the Danish settlements in Greenland. This bird belongs to still higher northern latitudes than the common eider. On some parts of the coasts of Greenland, on those of Spitzbergen, Nova Zembla, the North Georgian islands, etc., it occurs in great numbers. A few breed in Iceland and the Faröe islands. In Britain, the bird is a rare visitant. It is of about the same size as the common eider. The female is very similar to the female of that species; but the male has a remarkable large protuberance over the base of the upper mandible, and the white color of the neck extends only over the upper part of the back.

EIFFEL, THE, is a bleak and barren plateau situated in the extreme southwestern part of Prussia. It is bounded on the west by Belgium, and on the other three sides by the rivers Roer, Rhine, and Moselle. Its elevation averages from 1500 to 2000 feet, and is diversified by depressions and ridges that show plainly its volcanic origin, which, as it approaches the rivers, become wooded and rocky ravines. The plateau belongs to the Devonian formation, and the volcanic irruptions have brought near the surface in some portions a limestone that is particularly rich in fossils. Above this in some parts is found another formation, containing considerable quantities of zinc and lead. The soil is so poor that it is but little cultivated, and above 1700 feet the climate is so raw and bleak that little grows beside heather.

EIFFEL, GUSTAVE, engineer, was born at Dijon, France, in 1832; studied at the École Centrale; and in 1858 constructed the iron bridge over the Garonne at Bordeaux, and later that over the Douro at Oporto; also the remarkable viaducts of Garabet in Contal, and of Montuçon; the designs for the locks of the Panama canal; the framework on which Bartholdi's statue of "Liberty Enlightening the World" was built; and the celebrated Eiffel tower (q.v.), on the completion of which he was made an officer of the Legion of Honor. In 1893 he was sentenced to fine and imprisonment for complicity in the Panama canal frauds.

EIFFEL TOWER, THE, the colossal structure erected in the Champs de Mars at Paris by the famous engineer, Gustave Eiffel, from whom it derives its name, was completed

March 31, 1889, in time to serve as one of the notable features of the exposition of that year. It contains three stories, reached by a series of elevators; and the platform at the top is at a distance of 985 feet from the ground. In its construction nearly 7000 tons of iron were used; and the cost was estimated at nearly \$980,000, of which about \$292,000 was voted by the government, while the remainder was supplied by M. Eiffel, who trusted for his reimbursement to the receipts from admission fees during the twenty years for which he is entitled to the profits from the tower. The profits for the year 1889 alone nearly paid for the cost of the tower.

EIGHT, PIECE OF, a name once popularly given to the Spanish dollar, as being divided into 8 reals.

EIGHT-HOUR LAW, an act adopted by the U. S. congress in 1868, and subsequently by the legislatures of a number of the states, providing that in all government employment eight hours shall constitute a day's work. It was expected that this would have an influence on the practice in private employment. However desirable this result, the expectation has as yet been realized in only a small degree, as the labor-market seems to develop its own laws in its own time and way.

EIKON BASILIKÉ, a work presumed to have been written by Charles I. during his confinement, but now more correctly imputed to another writer. The following are the explanations of M. Guizot on the subject, in his *History of Oliver Cromwell and the English Commonwealth*: "It is to the *Eikon Basiliké* that Charles I. is principally indebted for the name of the royal martyr. The work is not by him; external testimony and internal evidence both combine to remove all doubt on the matter. Dr. Gauden, bishop, first of Exeter and afterwards of Worcester, under the reign of Charles II., was its real author; but the manuscript had probably been perused and approved, perhaps even corrected, by Charles himself during his residence in the Isle of Wight. In any case, it was the real expression and true portraiture of his position, character, and mind, as they had been formed by misfortune; it is remarkable for an elevation of thought which is at once natural and strained; a constant mingling of blind royal pride and sincere Christian humility; heart-impulses struggling against habits of obstinate self-consciousness; true piety in the midst of misguided conduct; invincible, though somewhat inert devotion to his faith, his honor, and his rank; and as all these sentiments are expressed in monotonous language, which, though often emphatic, is always grave, tranquil, and even unctuous, with serenity and sadness, it is not surprising that such a work should have profoundly affected all royalist hearts, and easily persuaded them that it was the king himself who addressed them." See GAUDEN, JOHN.

EIKONOKLASTES (*Iconoclastes*, "Image-Breaker"). A famous work written by John Milton (q.v.), Oct. 1649, in answer to the *Eikon Basiliké* (Royal Image), usually credited to Charles I. of England. An enlarged edition was published in 1650, which, with other works, called attention to the Commonwealth (q.v.) and to Milton himself, so that it came near causing his execution.

EILDON HILLS, three peaks in Roxburghshire, Scotland, near the romantic village of Melrose, commanding a view of the splendid scenery of the region. The story is that the renowned wizard, Michael Scot, found but one mountain there but divided it into three peaks. None of them are over 1400 ft. in height.

EILENBURG, a t. of Prussian Saxony, is situated on an island of the river Mulde, 26 m. e.n.e. of Merseburg. It is reached by two bridges, is surrounded by walls and ditches, and consists of the town proper with four suburbs. The manufactures of E. consist of calico, woolen yarn, tobacco, chemicals, beer, and agricultural implements. Pop. '90, 12,477.

EILETHY IA, a city of Egypt, anciently Nuben, and known at present by the name of El Kab. The town was anciently walled. The present ruins consist of the remains of small temples dedicated by Rameses II. to Ra; a Ptolemaic temple dedicated to the Eponymous goddess by Physcon or Euergetes II., with additions by Ptolemy Alexander I., and Cleopatra; and another temple dedicated by Amenophis III. to the local deities. The names of other monarchs are also found in the ruins; but the most interesting and important remains are the rock-tombs excavated in the vicinity. That of Aahmes-Pensuben, a functionary, records his military services in the wars of the early monarchs of the 18th dynasty against the Shos or shepherds, and other Asiatic and Nigritic races. Another, of Pahari, is decorated with paintings representing the pursuits of agriculture. Swine were sacred to the local goddess. The town itself, during the 18th dynasty, appears to have been governed by princes, and some of the tombs appear as late as the 19th and 20th dynasties.—Wilkinson, *Modern Egypt*, vol. ii. p. 270; Champollion, *Notice Descriptive*, p. 265; Brugsch, *Reiseberichte aus Aegypten*, p. 214.

EIMBECK, or **EINBECK**, an old t. of Hanover, is situated on the Ilme, 40 m. s.s.e. from Hanover, in lat. 51° 49' n., long. 9° 50' east. It was a place of considerable importance in the 15th c., and was a Hanse city, but has decayed greatly in recent times. The minster is large and beautiful. The houses of E. are antiquated; its streets narrow, tortuous, and badly paved. Pop. '90, 7676.

EINSIEDELN, a small t. of Switzerland in the canton of Schwyz and 9 m. n.n.e. of the town of that name. It is worthy of mention on account of its Benedictine abbey, containing a black image of the Virgin, to which about 200,000 pilgrims annually repair. The town has many inns and alehouses, supported chiefly by the pilgrims. The dedication

festival of the abbey, 14th Sept., is the great pilgrimage season. The present abbey, one of the finest in Switzerland, was built at the beginning of the 18th c., and is the fifth since the foundation of the abbey, in the 10th century. Its treasury was rifled by the French in 1798. Pop. '88, 8512.

EIRE, EYRE, JUSTICES IN (corruption of Lat. *in itinere*). By this term, both in England and Scotland, were the judges of assize (q.v.) formerly designated. Justices in eire were first established in England by the statute of Northampton (1176 A.D.), in the reign of Henry II. At first, they made the circuit of the kingdom once in seven years; but by Magna Charta, c. 12, the chief justices are directed to send justices through every county once in the year. In Scotland, the chief justiciar, says Erskine, i. 3, s. 25, was originally bound to hold yearly two justice courts or aires at Edinburgh and Peebles. This court gradually became fixed at Edinburgh. Besides this court, special "justice aires" were frequently held in the more remote parts of the country by the king in person, or by judges named by him, twice in the year, in spring and autumn (st. Robert III. c. 30, 1440 c. 5, 1491 c. 29). These courts were discontinued, but revived by 1587, c. 81. The term is still in use in Scotland, where, at the commencement of every circuit, proclamation is made to the lieges to attend the "circuit eire."

EISENACH, a t. of Germany, Saxe Weimar, is beautifully situated amid finely wooded hills on the Hörsel, 45 m. w. from Weimar. Once the capital of a principality to which it gave name, E. is still a prosperous and industrious town, and is well built, with wide, clean, and well-paved streets. E. has a ducal palace, a large and handsome building, now used as a court-house; a spacious market-place, including a handsome civic school; numerous churches; and a school of design. Its manufactures are woolen, cotton, and linen goods, soap, white lead, meerscham pipe-bowls, leather, and carpets; there are also breweries and tanneries, and oil, powder, and spinning mills. Pop. '90, 21,399.

On a lofty eminence in the immediate vicinity, surrounded by forests, stands the castle of Wartburg, now used as a prison, but formerly a residence of the landgraves of Thuringia, and worthy of notice as the spot where the Minnesingers (q.v.) assembled to hold a trial of skill in 1207, but chiefly as being the asylum to which Luther, at a time of great danger, was carried by his friend the elector of Saxony, who, waylaying the great reformer, seized him, with an appearance of violence, and hurried him to this fastness, where he remained in safety from May, 1521, to Mar., 1522. The chapel in which Luther preached, as well as the chamber which he inhabited, and in which he discomfited the evil one by throwing the inkstand at his head, is still pointed out. Another portion of the castle contains a fine armory, with suits of the 16th and 17th, and even, it is said, of the 13th and 14th centuries.

EISENBERG (Ger., Iron Mountain), a small t. of Germany, in the duchy of Saxe-Altenburg, is situated on an eminence near the Saale, 26 m. e. of Weimar. It is well built, its chief edifices being the castle, the observatory, the lyceum, and the town-house. E. has manufactures of woollens, porcelain, and earthenware, and has annual fairs. Pop. '90, 7349.

EISENBURG, or VAS VARMEGYE, a co. in w. Hungary, on the border of Styria; 1945 sq. m.; pop. '90, 389,854. It is mountainous, fertile, and well watered. The productions are coal, mineral waters, quicksilver, corn, wine, fruit, and tobacco. Chief town, Szembathely, or Stein-am-Anger.

EISENERZ, a small t. of Austria, in the n. of the province of Styria, 20 m. w.n.w. of Bruck. Its appearance is dirty and unprepossessing, and it is worthy of mention only for its connection with the Erzberg (ore mountain), at the southern base of which the town lies. This mountain, which is about 2,840 ft. high, and about 5 m. in circumference at the base, is literally a solid mass of iron ore, of a quality so rich, that, instead of cutting mines into it and following the metal in veins—which process was formerly adopted here—the top and sides of the rock are quarried from the outside, and the ore is then broken small, and conveyed to the smelting-house without further preparation. Mines have been worked on this mountain for upwards of 1000 years. Arragonite (*eisenblüte*, or *flos ferri*), resembling branching coral in form, and of the most beautiful and purest white, is found in grottoes in the interior of the mountain. Nowhere else does it occur in equal perfection. Pop. 1890, 2433.

EISENSTADT, a free t. of e. Hungary, stands in lat. 47° 50' n., and long. 16° 30' e., 12 m. n.n.w. of Oedenburg. It is a walled town, has two gates, and consists principally of three main streets. It has also a Franciscan monastery, containing the burial-vault of the Esterhazy family, who are the proprietors of the palace, which forms the chief architectural feature of Eisenstadt. This palace was built in 1683, but was altered and enlarged in 1805. It contains 200 chambers for guests, and has a saloon sufficiently large to dine 1000 people. Its library contains a magnificent collection of church-music—masses, litanies, oratorios, etc., with some of Handel's MSS. In the suburbs is a conservatory, one of the largest in Europe, containing 70,000 specimens of exotic plants. Pop. '90, 2972.

EISLE'BEN, a t. of Prussian Saxony, is situated about 20 m. w. of Halle. E., once capital of the counts of Mansfeld, is the centre of a rich mining district, and consists of old town, new town, and suburbs. E. makes large quantities of beer, and has manufactories of potash and tobacco; in the vicinity are copper and silver mines, producing yearly about 1000 tons of copper, and 25 tons of silver. Pop. '90, 23,903. Here, on Nov. 10, 1483, Luther was born, and here also he died, Feb. 16, 1546. The house in which he was born was partially consumed by fire in 1689. An interesting remnant of it, however, is still extant, having the portrait of Luther placed over the entrance. In the church of St. Andrew are the cap, cloak, and other relics of the great reformer, and the city contains a bronze statue of him, erected in 1883.

EISTEDDFOD, the name given to a gathering of Welsh bards and musicians for competition in national minstrelsy, and for the preservation and cultivation of the national poetry and music. In 1887 the regular meeting was held in London, and in 1890 Queen Elizabeth, of Roumania (Carmen Silva), was the chief guest. Eisteddfods are frequently held in the United States. See **BARD**, and **WELSH LANGUAGE AND LITERATURE**.

EJECTMENT, ACTION OF, an action brought to recover possession of land, and also to obtain damages for its being wrongfully withheld from the person who brings the suit. This, in the common law practice, is the only surviving instance of a mixed action; that is, one partaking in part the nature of a real action, in part that of a personal action. The process of establishing title to real estate by this action was formerly—and still is, in a few of the states in this country—a most intricate and serious one. It was carried on by a series of legal fictions, and it is interesting to examine this process as the best possible illustration of the use in law of fictions. The action took the place of a former strictly personal action of ejectment. Such an action was brought, not to recover the title of land itself, but by the lessee to recover damages for the injury sustained on account of being deprived of the use of the land for a certain term. To maintain such an action the plaintiff was obliged to show: 1, good title in the owner alleged; 2, a lease by him; 3, entry on the land by his lessee; 4, ouster from the land. But as, when it was desired to test the question of title, this state of facts very likely might not exist, and as common law procedure had provided no other way of testing the title, a series of fictions was introduced into the case. It was alleged, let us say, that A, the plaintiff who claims title to the land, had entered upon it and had made a lease to an imaginary person, John Doe; that John Doe had possession, but had been ousted therefrom by another fictitious person, Richard Roe; and that finally Richard Roe claimed his right of possession as tenant from B, the real defendant, whose title A wished to impugn. It was not necessary that actual entry should have been made by A, and a lease given to John Doe, as above; that part of the transaction might also be fictitious. The method of proceeding was to notify B, or any actual tenant of B's in possession, that his alleged tenant, Richard Roe, had been sued; that Roe was what was called a "casual ejector," that he would make no defence, and that B must, therefore, appear to defend his own title. When by this elaborate and ingenious method the real tenant or owner was brought into court, the fictitious legal machinery which had been used for that purpose was cast aside by the simple process of refusing to allow such a defendant to appear in the case until he had confessed formally the alleged fictitious lease and other proceedings between John Doe and Richard Roe. Thus the question of the possession by a lessee, the ostensible cause of the action, was thrown out, and the only issue remaining to be tried was that of title. An amusing account of the absurdities that might be involved in such a process was given in the novel called "Ten Thousand a Year," by Dr. Warren. In England this form of action of ejectment was abolished in 1852, though the name was still retained. By the Judicature Acts of 1875 actions for the recovery of land were placed on the same footing as other actions, and what had been retained of the old common law action was superseded by a simple and uniform method. Legislation to a similar effect has been adopted in several of the states in this country; in others the action of ejectment is maintained in much the same condition in which it was left after the English act of 1852; in a very few others the ancient form is still in use. The remedy given by an action of ejectment is one that may be used for the recovery only of corporeal property, not of incorporeal hereditaments, such as an easement or a dower right; nor will such an action lie to recover personal property. An action of ejectment may be brought by any one who has the legal right to enter and possess the land without regard to the exact character of his estate therein; and any person may be made defendant who has wrongfully seized or held the property under a claim of right against one holding a lawful estate therein. The burden of proof of title lies with the plaintiff, the presumption of law being in favor of the actual possessor, who need not, therefore, prove his own title otherwise than against the plaintiff. The verdict in an ejectment suit is for the plaintiff to recover peaceable possession of the land, or for the defendant to retain his possession. Under the old practice the damages which might be given to the plaintiff, together with possession, were purely nominal; a supplementary suit might be brought if substantial damages were really demanded. But under the later English practice, and certainly in several of our states, substantial damages may be granted on the original trial. Such damages may also be in the nature of an accounting for mesne, or intermediate profits.

EJOO. See GOMUTO.

EKATERINBURG, a fortified t. of Russia, in the province of Perm, is situated on the eastern slope of the Ural mountains, on both banks of the Isset, in lat. $56^{\circ} 50' \text{ n.}$, long. $60^{\circ} 7' \text{ e.}$ The majority of the houses are of wood, but there are also many very handsome stone buildings. In the southern portion of the town, which is connected with the northern by a fine bridge, are the government magazines, the mills, factories, and the market-place. The opposite side, however, is the handsomer. It contains the dwellings of the mine proprietors and of the merchants, and is laid out in elegant and spacious streets. E. is the seat of administration for the Ural mines, and is in the center of the mining districts of these mountains. Among its institutions, it has a museum of mineralogy, an excellent chemical laboratory, a school for educating miners, an imperial mint, numerous works for cleansing and amalgamating metals, and for cutting and polishing precious stones. The greater number of the inhabitants are supported by the productiveness of the neighboring mines. E. stands on the high-road between Russia and Siberia, and is therefore a place of brisk trade. In the vicinity are the gold mines of Niviansk and Beresoff. Pop. '92, 36,825. E. was founded by Peter the Great in 1723. Its average temperature during the year is $31^{\circ} 9'$.

EKATERINODAR, a t. of Russia, and capital of the country of the Cossacks of the Black sea, is situated on the right bank of the river Kuban, about 100 m. from its mouth, in lat. $45^{\circ} 5' \text{ n.}$, long. 39° east. It is surrounded on all sides by swamp and morass. Its houses are almost all of earth, have thatched roofs, and are of one story in height. The streets are broad, regular, and straight, but exceedingly dirty. Pop. '92, 77,060.

EKATERINOGRAD, a t. and fortress in the s. of Russia, in the government of Caucasus, is situated on the left bank of the Terek, in lat. $43^{\circ} 40' \text{ n.}$, and long. $44^{\circ} 3' \text{ e.}$ It is an important military post of the Cossacks; its houses are regular, but miserably built. A stone triumphal arch was erected at E. by Catharine II., in memory of prince Potemkin, who founded the town in 1777.

EKATERINOSLAV, a government of Russia, in the province of South Russia, bounded on the n. by Little Russia, and on the s. reaching in one part to the shores of the sea of Azov. The government of E., together with that isolated portion of it which lies on the eastern border of the sea of Azov, and comprises the district of Taganrog and the country of the Azovian Cossacks, has, in all, an area of 26,148 sq. m., and in 1892 had 1,676,563 inhabitants. The greater part of the area is an undulating steppe, or plain, which slopes gradually towards the south. The province is watered by the Dnieper, Don, Donets, and their affluents, some of which are navigable. In the east are extensive veins of coal and other ores, and the province is an important mining centre. There are deposits of fireproof clay, clay for earthenware, and gypsum. The climate is mild and a great many highly esteemed fruits, such as apricots, peaches, cherries, etc., which do not occur in the more northern parts of Russia, are found here. A large part of the soil is cultivated and fertile, and the chief source of wealth is the raising of wheat. There are also extensive orchards, and large numbers of cattle and sheep are raised. At the mouth of the Don are valuable fisheries. Only a small portion of the province is covered with forests. Russians began to people the province toward the end of the 18th century, but since that time it has developed into one of the most populous of the governments. The bulk of the population is Little-Russian, but it includes Greeks, Jews, Germans, and Armenians.

EKATERINOSLAV, a fortified t. of South Russia, is situated on the right bank of the Dnieper, 250 m. n.e. from Odessa, in lat. $48^{\circ} 27' \text{ n.}$, long. $35^{\circ} 5' \text{ east.}$ It was founded in 1787 by the empress Catharine II. E. has manufactures of silk and woolen goods, and an important annual wool-fair. It is the residence of an archbishop. In the vicinity is a palace, now in a ruinous condition, formerly the residence of prince Potemkin. Pop. '92, 83,736.

EKERÖE. One of the Aland Islands, in the Gulf of Bothnia, west of Aland, and about 12 m. in length.

EKHMIM, or AKHMIM, a t. of Upper Egypt, 53 m. s.s.e. from Siout, on the right bank of the Nile, and about a quarter of a mile from it. It occupies the site of the ancient *Chemmis*, or *Panopolis*, one of the great cities of the Thebaid. Remains of ancient buildings exist. Cotton fabrics are manufactured here. Pop. supposed to be about 18,800.

EKRON, the most northerly of the five cities of the Philistines. It was assigned to Judah, but afterwards given to Dan. Before the monarchy it again came under the rule of the Philistines. It was the last place to which the captured ark of the covenant was taken by the Philistines, before its restoration to the Israelites. After David's victory over Goliath, the Philistines were pursued as far as this place. The name occurs in cuneiform inscriptions and on Syrian monuments. The site has been recognized in Akir, a Moslem village 5 m. s.w. of Ramleh. It has a dreary and forsaken appearance.

ELÆAGNUS, a genus of exogenous plants, of the natural order *elagnaceæ*. This order consists of trees and shrubs, usually covered with scurfy scales, and having alternate or opposite entire leaves, without stipules. There are only about thirty known species of this order, all natives of the northern hemisphere, but found both in its warm and cold regions. The sallowthorn (q.v.) is the only British species. *Shepherdia argentea*, a North American shrub of this order, yields a pleasant fruit. The genus *elæagnus* consists of a number of deciduous shrubs or low trees, with male and female flowers on the same plant. *E. angustifolia*, the OLEASTER, sometimes called wild olive, is a native of the s. of Europe and the Levant, a spiny tree of 15 to 20 ft. in height, with lanceolate leaves, which, as well as the young shoots, are hoary with stellate hairs. It is frequently planted in England, for the sake of its silvery white foliage, beautifully contrasting with the green of other trees, and its very fragrant flowers, which are small and of a dull yellow color.

ELÆIS. See OIL PALM.

ELÆOCARPACEÆ, according to some botanists, a natural order of exogenous plants, but regarded by others as merely a sub-order of *tiliaceæ*; the chief distinctions being deeply cut or fringed petals and anthers opening at the apex. The E. are mostly East Indian trees. The fruits of some are eaten; those of some are dried and put into curries; those of *elæocarpus serratus* are pickled in brine and eaten with oil in Ceylon, and much resemble olives. *E. cyaneus*, a native of New Holland, is here figured. The deeply wrinkled seed or stone of the fruit of some, particularly *elæocarpus ganitrus* and *monocera tuberculata*, being very hard, and having a fine sculptured appearance, are made into beads for necklaces and bracelets, and are sometimes set in gold. They are often called OLIVE NUTS. These beads are frequently worn by religious devotees in India, and are sometimes sold as ornaments in the shops of Europe.

ELÆOCOC'CA, a genus of *euphorbiaceæ*, the seeds of some of which yield useful oils. The oil obtained from *E. verrucosa* is used for food in Japan, notwithstanding considerable acidity. The tree is cultivated in the Mauritius, and the oil is there used only for burning. That obtained from *E. vernicia* is used in painting in China.

ELÆODENDRON, a genus of trees of the natural order *celastraceæ*, having a 5-partite calyx, 5 petals, a 5-angled disk, 5 stamens, the ovary immersed in the disk, and a drupaceous fruit. *E. glaucum*, a native of Ceylon and the s. of India, is sometimes called the *Ceylon tea-tree*, from the resemblance of its leaves to those of the tea-shrub. The timber of *E. croceum*, called SAFFRONWOOD at the cape of Good Hope, is much used there in building and cabinet-making; it is fine-grained, hard, and tough. The fruit of *E. kuba*, another South African species, is eaten by the colonists. That of *E. argan* yields an oil similar to olive oil, much used by the Moors.

ELAGAB'ALUS, or HELIOGABALUS, emperor of Rome, was b. at Emesa in 204 A.D. His real name was Varius Avitus Bassianus, but having, when a mere child, been appointed high-priest of the Syro-Phœnician sun-god Elagabal, he assumed the name of that deity. Soon after the death of his cousin Caracalla, E. was proclaimed emperor by the soldiers, in opposition to the legitimate sovereign, Macrinus, who had become obnoxious to the troops from the severity of his discipline. The rivals met in battle at Antioch in 218 A.D. Macrinus was defeated, and E. quietly assumed the purple. His reign, which lasted rather more than three years and nine months, was infamous for nearly unparalleled debaucheries of every kind in which he indulged. He was murdered in an insurrection of the prætorians in 222 A.D., and was succeeded by his cousin and adopted son, Alexander Severus.

ELA'IN. See OLEINE.

ELAM, or SUSIANA, an ancient name of the mountainous district e. of Babylonia, stretching from India to the Persian gulf, including a low tract of fertile land in which are the marshes around the mouths of the Tigris and Euphrates. Its inhabitants were mostly nomadic. In certain portions it produces large quantities of grain. The chief city and capital was Shusan, or Susa.

ELAND, *Antilope oreas*, a species of antelope, abounding in s. Africa, wherever there are fertile plains and low hills, except in the longest settled and most cultivated parts of Cape Colony, where it has been too much hunted to be any longer of very frequent occurrence. It is described by Livingstone as "the most magnificent of all antelopes." It is one of those which are sometimes called *bovine* antelopes, because they seem to approximate a little in some of their characters to the ox-tribe, having a broader muzzle, less slender limbs, and greater bulkiness of form than the antelopes in general. The E., however, is a very graceful and beautiful animal; it is as large as a horse, fully 5 ft. in height at the shoulder, and weighs from 7 to 9 cwt. The horns—which in the male are about a foot and a half long, and in the female longer and more slender—are almost straight, inclining backwards and outwards; they are pointed, and their great strength is increased by a spiral wreath. The E. has a large protuberance on the larynx, in this resembling the elk, from which, probably on this account, it has derived its name. It is also known as the *impoof* or *impoofoo*. Its tail very much resembles that of an ox, and terminates in a tuft of long black hair. It is a gregarious animal, and the

herds are often large. It is generally very fat, and not difficult of pursuit, its gentleness also increasing the facilities of the hunter. Its flesh is very much esteemed, particularly the muscles of the thighs, which are dried like tongues. It is surprising that no attempt has been made to domesticate, for useful purposes, an animal possessing so many valuable qualities. See *illus.*, ANTELOPES, vol. I.

Livingstone discovered a variety of the E. in regions to the n. of the Cape Colony, having the body marked with narrow white transverse bands. According to the figure given in his travels, it seems even more bovine in form than the common variety.

E'LANET, *Elanus*, a genus of *falconidae*, allied to the kites, which they resemble in many of their characters; but from which they differ in having the short tarsi half covered with feathers, and the claws, except that of the middle toe, rounded beneath. The tail is very little forked. One species (*E. melanopterus*) is common in Africa, from Egypt to the cape of Good Hope, and is found also in India. Another species is the black-shouldered hawk (*E. dispar*) of America, the northern limit of which appears to be South Carolina. Both of these feed chiefly on insects, which they catch on the wing, but they also prey on small birds and reptiles.

ELASTIC CURVE, according to James Bérnoulli, the figure which would be taken by a thin horizontal elastic plate if one end was fixed and the other loaded with weights.

ELAPS, a genus of venomous serpents, inhabiting the warm parts of the world, and chiefly the Indian islands, New Holland, and tropical America. They are of slender and cylindrical form, with an elongated head, and often of bright and beautiful colors. They are not very agile, are said to prey chiefly on other reptiles, and live among the luxuriant vegetation of meadows or of forests.

EL-ARA'BAH is the name of the great depression of country which extends from the Dead sea to the gulf of Akabah. From the foot of Mt. Hermon to the Elanitic gulf of the Red sea there is a deep valley that is classed by geographers among the most remarkable depressions on the globe. It is divided by a line of chalk cliffs, which cross it about 6 m. s. of the Dead sea. North of these the valley, at the present day, is named El-Ghor (q.v.); s. of them the old Hebrew name El-Arabah is retained. The whole length of this part is about 100 miles. Its greatest width, 60 m. n. of the gulf of Akabah, is from 10 to 12 m.; its least at the gulf, not more than 3 or 4 miles. On the *western* side are the horizontal lines of the Tih, white and desolate, mounting up 1500 or 1800 ft. from the valley by huge steps, with level barren tracts on their tops, and crowned by the plateau of "the wilderness of the wanderings." This range has two principal passes; one, very steep and difficult, is close to the gulf, and is known simply as "the pass." Through it the Mecca pilgrims climb. The other, on the road from Petra to Hebron and leading up from the plateau to a level 1000 ft. higher, is probably the point at which the Israelites, when attempting against the divine command to "go up" into the promised land, were repulsed by the Amalekites coming down from the hill. On the *eastern* side are the mountains of Edom, which rise to a height of more than 2,000 ft., and are crowned by Mt. Hor, 5,600 ft. high. These mountains are verdant, and in many parts cultivated, yielding good crops. Ruined towns and villages abound, attesting the former prosperity of the country. The numerous wadys, which come down from the mountains, generally contain streams sufficient to keep vegetation alive. One of these begins near the Akabah, leading by the back of the range to Petra, and thence to the Dead sea. Along it there are traces of a Roman road. Another gives the most direct access from El-A. to Petra. After the discovery that a prolonged depression exists from Mt. Hermon to the Red sea many persons naturally assumed that the Jordan formerly flowed through its whole extent. But this theory is sufficiently disproved by the levels, imperfect as they are, which have lately been taken of the Jordan and the Dead sea. These have been found to be below the level of the gulf of Akabah and the drainage of the northern portion of El-A. is into the Dead sea, and that of the southern portion into the gulf. A ship canal is proposed from the gulf to the Mediterranean.

EL-ARAISH, or L'ARAISH (Fr. Larache), a t. in Morocco, on the Atlantic ocean, 45 m. s. of Tangier, well situated on a rocky height, and the seat of a military governor. It is one of the most frequented ports on that part of the coast. Pop. about 5000.

ELASMOSAU'RIANS, gigantic marine saurians of the cretaceous epoch. One species had vertebræ nearly as large as those of an elephant. It was like a whale in bulk, with a long flexible neck, paddles short, tail serpent-like, skull light with a long flat muzzle with nostrils or spout-holes near the orbits, teeth sharp and well fitted for seizing fish. It reached 45 ft. in length. Its remains have been found especially in New Jersey.

ELASTICITY, or **SPRING**. When an external force acts upon a solid body, it produces at first slight alterations in the relative positions of the particles; and if before these alterations exceed a certain limit, the force ceases to act, the particles return to their former position, and the disfigurement disappears. This power or property of recovering their previous form after alteration, is called E., and we are justified in ascribing it to all bodies, though in very different degrees. It was once believed that there were definite limits within which changes of form produced by pressure or other

forces disappeared completely. It was thought, for instance, that when a weight of no great magnitude is suspended from a metallic wire, the slight increase of length which the wire is observed to undergo, is completely lost when the weight is removed; and the limit to which the wire might thus be stretched, and still suffer no permanent increase of length, was called the limit of its elasticity. But recent more accurate experiments have shown that no such limits exist, at least in the case of metals; or, which is the same thing, that permanent lengthening results, however slightly the wire be loaded—it never contracts again quite so far as it was stretched. It is necessary, therefore, to fix the limit arbitrarily; and this is done by agreeing that it shall be held to begin when the metal in question suffers a permanent elongation of 0.00005 of its length. To get the elastic extensibility of a wire, then, we must compare its length suspended, with its length when the weight is removed. In this way it is found that the extensions produced are proportional to the extending forces or weights. From this law, then, we can calculate what weight it would require to stretch a wire or rod of a sq. in. in section to double its own length; supposing it possible to proceed so far without breaking it, and that the law of E. continued up to this point unaltered. This weight, which is different for every metal or kind of wood, is called the *co-efficient* or *modulus of elasticity* of the particular substance; and is used in mechanics in calculating how far a given weight will extend a wire or rod of given diameter. This co-efficient is not constant for the same metal; for all circumstances that increase the density of the metal, increase the modulus of elasticity. Bodies manifest E., not only when extended in length, but also when compressed, when bent, or when twisted. If an ivory ball be dropped from a height upon a marble slab smeared with fat and lampblack, when caught after the rebound, it is seen to have touched the marble, not in a point, but in a circle of several lines in diameter; and must therefore have lost for a time its spherical shape over that extent. In the same way the mark of a well-hit golf-ball is pretty broadly shown upon the face of a club after the stroke. The E. shown by wires and threads of glass when twisted, has been turned to account in the torsion-balance (q.v.), for measuring other weak forces. Steel, ivory, caoutchouc, etc., are well known for their elastic properties, to which they owe much of their utility.

The propagation of waves of sound through solid bodies depends upon their E.; and from observations of this kind made with different substances, the modulus of E. for each may be deduced; the results, however, differ slightly from those arrived at by attaching weights, owing to the heat produced by the vibratory movement.

All solid bodies are only imperfectly elastic—that is, they do not quite recover their form and volume when the disturbing force ceases. Liquids and gases, on the contrary, are perfectly elastic, or return exactly to their original bulk or volume when the pressure is removed. The elasticity of liquids and gases, however, acts only in expanding after compression, while that of solids acts also in contracting after extension. The expansive elasticity of liquids and gases is equal to the force used to compress them. Water and other liquids are easily seen to be compressible, by the fact of their conveying sound—a sound-wave being merely a *state* of compression, propagated from each layer of the liquid to the next. The coefficient of elasticity of water determined by Colladon and Sturm, from the velocity of sound in the lake of Geneva, agrees very well with that determined by direct measurements in Oerstedt's apparatus. The discovery of the compressibility of water is an English one, due to Canton, in 1762. Previous attempts, by Italian and Dutch philosophers, to compress water by hammering a silver shell filled with that fluid, had failed to give any certain result, as the water was forced through the pores of the metal. At a temperature of 50°, one atmosphere compresses water to about 0.999995 of its volume. From the existence of a maximum density temperature for water, some curious consequences arise with regard to the effects of pressure on the fluid. The volumes or bulks which a given quantity of any gas assumes under different pressures, are nearly in inverse proportion to the pressures. See **MARIOTTE'S LAW**. The elasticity of gases is usually measured by the height of the column of mercury that they sustain. The elasticity of gases is a force much and variously employed in the arts of life. See **AIR-GUN**, **AIR-PUMP**, **GUNPOWDER**, etc.

ELASTIC TISSUE, known also as yellow fibrous tissue, is one of the forms of fibrous tissue. It derives its name from the remarkable physical property which it possesses of permitting its fibers to be drawn out to double their length, and again returning to their original length. It occurs in various ligamentous and other structures of the animal body in which elasticity is required, as, for example, in the vocal cords, the membranes connecting the cartilaginous rings of the trachea, the middle coat of the arteries, the skin, etc.

ELATEA (anc. CITHÆRON), a mountain range in Greece, between Bœotia and Attica, frequently mentioned by the early poets. The highest peak is a little over 4600 ft. above sea-level.

EL'ATER, a Linnæan genus of coleopterous insects, now divided into many genera, and forming the tribe or family *elateridae*. They have a narrow elongated body; the head is in almost all cases inserted deeply into the thorax; a strong spine on the under part of the thorax at its base, fits into a groove; the legs are short, and rather slender.

They are generally found upon the flowers and leaves of plants, which are their food. When disturbed, they fold their legs and antennæ close to the body, and let themselves drop to the ground. If they fall on their back, or are placed on it, the shortness of their legs incapacitates them for obtaining another position by the means common to other insects; but they are enabled to do so by a violent muscular exertion, arching the body a little, and suddenly straightening it again, so that they fling themselves into the air with a jerk and a *click*. Hence the names click-beetle (q.v.) and SKIP-JACK. The spine and groove of the thorax are supposed to be of use in this. The larvæ are long, rather slender, with six feet near the head, and a tough skin. Many feed on rotten wood; others, wire-worms (q.v.), on the roots of plants. Many are British. Some of the *elateriæ* of tropical regions diffuse from spots on the thorax a strong and beautiful light, and are called fire-flies (q.v.).

ELATERIUM, a drug obtained from the fruit of the SQUIRTING CUCUMBER, or SPIRTING CUCUMBER (*ecbalium agreste*, formerly known as *momordica elaterium*), also called the wild cucumber, an annual plant of the natural order cucurbitaceæ, a native of the s. of Europe, common on rubbish in the villages of Greece and the archipelago. The whole plant is rough, with stiff hairs; it has a trailing branching stem, without tendrils; the leaves are heart-shaped, somewhat lobed and toothed, on long stalks; the flowers axillary, yellow, the male flowers in small racemes; the fruit oblong, about an inch and a half long, grayish green, covered with soft prickles, and finally parting from its stalk, and expelling its seeds along with a thin mucus through the aperture where the stalk was inserted. This remarkable phenomenon is ascribed to osmotic action within the fruit; a thin membrane separating a mucus which immediately surrounds the seeds from a less dense juice which abounds in the succulent part of the fruit, and the quantity of the former being gradually increased at the expense of the latter, till, on the perfect ripening of the fruit, the much distended central cell is opened, to permit its ejection. It is this mucus surrounding the seeds—a thick green mucus of a very peculiar character—which contains the elaterium. To obtain the drug, the juice of the nearly ripened fruit is allowed to stand for a short time, when it becomes turbid, and deposits a sediment. The sediment, carefully collected and dried, is elaterium. It is of a pale grayish-green color, light and friable, with an acrid taste, and a peculiar not unpleasant odor. It is an exceedingly powerful or drastic purgative, used chiefly in dropsies, and in very small often-repeated doses. It should not be used except under medical advice. It acts as an irritant not only on the eyes, if it comes in contact with them, but even on the fingers of those who handle it. Its properties seem to depend chiefly on a crystalline principle called *elaterin*. The use of E. was known to the ancients.

ELATH, or **ELANE** (now **AILAH**), a t. in Idumea on the shore of the Elanitic gulf of the Red sea; the place where Solomon fitted out his ships for bringing treasures from Ophir. David captured it from the Edomites. It is an important point in the route between Medina and Cairo.

ELATMA. See **JELATOM**.

ELBA (Lat. *Ilea*, Gr. *Æthalia*), an island belonging to the kingdom of Italy, in the Mediterranean sea, between Corsica and the coast of Tuscany, from the latter of which it is separated by the channel of Piombino, a strait 5 m. in breadth. Its greatest length is about 18 m., and its breadth varies from 3 to 10 m., this irregularity being caused by indentations both on its northern and southern shores. Its area is about 90 sq. miles. The coast is bold and precipitous. The surface is traversed from w. to e. by a chain of mountains, which divides into two spurs at the eastern extremity of the island; the highest summit, Monte della Capana, attaining an elevation of 3,500 ft. above sea-level. These mountains are for the most part bare; but on their lower ridges and in the valleys, the vine, olive, mulberry, and other trees flourish. The climate, except in the low-lying districts on the shore, is temperate and healthy. There are few streams in E., but it has numerous wells. The principal products are wine, white, red, and sweet, and of good quality; wheat, Indian corn, vegetables, and water-melons. Great quantities of salt are produced annually from the salt-pans on the shore. Sheep, goats, pigs, and asses abound, but horned cattle and horses are scarce; the coasts supply fish plentifully. Iron of excellent quality is obtained from a mountain in E., 2 m. in circumference, and 500 ft. in height. This hill, which stands on the e. coast, is almost entirely a mass of ore, and so rich that it yields from 50 to 75 per cent. E. also yields loadstone, alum, vitriol, and marble. Porto Ferrajo, the capital and residence of the governor, has a population of about 4,000. E. has been rendered famous in history from having been Napoleon's place of exile from May, 1814, till Feb. 1815. Pop. about 24,000.

EL BASSAN, **ALBASSAN** or **ILBASSAN**, a t. of European Turkey, in the province of Albania, on the Scombi, 35 m. e. from the mouth of the river. It stands in a fertile plain, surrounded by mountains, is the capital of a sanjak, and the seat of a Greek bishop. It has manufactures of iron and copper wares. Pop. about 15,000.

ELBE (called by the Romans *Albis*—i. e., white—and by the Bohemians *Labe*), an important river of northern Europe. It originates in the confluence of numerous

streams which rise at the south-western base of the Schneekoppe (Snowcap), one of the highest summits of the Riesen-Gebirge, a mountain-range on the northern border of Bohemia. The course of the E. begins near lat. $50^{\circ} 45'$ n., long. $15^{\circ} 36'$ e.; at an elevation of about 4,400 ft. above sea-level. Its total length, including windings, is estimated at from 700 to 720 m. and its basin at 56,000 sq. miles. The average depth of the E. is 10 ft., and its mean breadth 900 ft., although occasionally it has a width of upwards of 1000 ft., and at its mouth of several miles. In the course of its progress to the sea, it is joined by 17 rivers and upwards of 70 streams. From the base of the Schneekoppe, it flows s. to Pardubitz, whence it proceeds w. to Brandeis, and afterwards in a general n.w. direction past Melnik, Leitmeritz, Aussig, and Tetschen, where it quits the Bohemian territory, and enters Saxony. At this point, it is 355 ft. wide. Its principal affluent in Bohemia is the Moldau. On its course n.w. through Saxony, the E. passes Pirna, Dresden, and Meissen, and entering Prussian Saxony, about 7 m. above Mühlberg, it advances to Rorgau and Wittenberg, from which point it flows first w., then n.w. to Magdeburg, receiving in its progress the Mulde and the Saale, both from the left. From Magdeburg flowing n.e., the E. arrives at the border of Brandenburg, receiving the Havel from the right; then turning n.w., it forms the boundary between Prussian Saxony and Brandenburg, and enters Hanover, through which it flows for upwards of 30 miles. Then still flowing n.w., it forms the boundary of Lauenburg, the Hamburg territory, and Holstein on the n., and Hanover on the s., until it empties itself into the North sea at Cuxhaven, where it attains a breadth of upwards of 10 miles. At this point, the tide rises 12 or 13 feet. The E. is divided into several branches between Hamburg on the n., and Harburg on the s., by the numerous islands that there interrupt its course. Vessels of 14 ft. draught can at all times ascend to Hamburg. The scenery of the valley of the E., although generally pleasing, is not remarkable in any portion of its course, except that which extends between Aussig and Dresden. Between these two towns, the course of the E. is generally between bold cliffs, and high natural battlements of rock; the banks covered with foliage, wherever a tree can support itself; and occasionally varied by a strip of green glade. It has been said that here the E. has all the variety of the English Wye, on a scale nearly as majestic as that of the Rhine. Its waters are stocked with abundance of highly esteemed fish; beavers likewise build in the stream. Steam-boats ply from Dresden up the river, and down as far as Torgau, as well as from Magdeburg to the sea. The navigation of the E. was formerly impeded by all manner of imposts and monopolies.

ELBERFELD, one of the most important manufacturing towns in Germany, is situated on both sides of the Wupper, an affluent of the Rhine, 16 m. e.n.e. of Düsseldorf. Its site, in the narrow and hill-girt valley of the Wupper, is picturesque and healthy. The old parts of the town are poorly built, straggling, and irregular, but the more recently erected portion is well built, with numerous spacious and imposing buildings, in a high architectural style. E. is chiefly famous for its dyeing, bleaching, and printing establishments, also for its extensive and important manufactures of cotton, silks, tapes, ribbons, merinos, fancy woollen goods, velvets, etc. Bleach-fields occupy a great part of the environs of E., and of the banks of the Wupper, the waters of which are said to possess very valuable bleaching properties. At E., the well-known dye, Turkey red, is imparted to yarns, at a cheaper rate, and with more clearness and firmness of color, than at any other town in Europe. The patterns for the printed goods are designed at Elberfeld. E. supports, amongst its numerous educational institutions, an important establishment, in which young manufacturers and overseers are taught the management of the Jacquard-loom, pattern-drawing, etc. Like the rest of the Wupper valley, E. is notable for religious zeal and orthodoxy. Pop. of Elberfeld, '95, 139,168. E. is connected by a tramway with the neighboring town of Barmen (q. v.), also the seat of extensive manufactures.

ELBERT, a co. in e. Colorado, bordering on Kansas; formed 1874; intersected by Bijou, Kiowa, and Big Sandy creeks, and Union Pacific railroad; surface, an elevated treeless plain; soil arid. Area, 1880 sq. m. Pop. '90, 1856. Co. seat, Kiowa.

ELBERT, a co. in n.e. Georgia, on the Savannah river; 406 sq. m.; pop. '90, 15,376. Surface hilly, with much forest land; soil fertile, producing corn, cotton, etc. Co. seat, Elberton.

ELBERT, SAMUEL, 1743-88; b. S. C.; served in the revolutionary army, rising to brevet brigadier-general. In 1785 he was elected governor of Georgia.

ELBEUF, or **ELBEUF**, a manufacturing t. of France, in the department of Seine-Inférieure, is delightfully situated in a picturesque valley on the left bank of the Seine, about 75 m. n.w. from Paris. It was originally badly built, but it has been greatly improved. Large factories also have arisen rapidly; and a spacious market-place (*champ de foire*), adorned with rows of chestnut-trees, has been erected. The two principal public buildings of E. are the churches of St. Étienne and St. Jean-Baptiste, both containing fine specimens of richly painted glass. The factories of E. and the vicinity, which are very numerous and are for the most part worked by steam-power, give regular employment to a great part of the population. The manufactures are principally double-milled and waterproof cloth, flannel fabrics, billiard table-

covers, and light woollens of every color and description. E. has active steam communication with Paris, Havre, and Rouen. The pop. in '91, was 21,097. E. which has been called the Leeds of France, had 80 cloth manufactories as early as the 16th century. In consequence of the revocation of the Edict of Nantes, the greater number of the cloth manufacturers emigrated; and it was not till after the revolution of 1789, and more particularly since the separation of Belgium and France, that industry again began to flourish.

ELBING, a considerable trading and manufacturing t. in West Prussia, is situated in the midst of a fertile valley, on the navigable river of the same name, 34 m. e.s.e. of Danzig, and 5 m. s. of the s.w. extremity of the Frisches Haff, into which the Elbing flows. It is connected by a canal with the Nogat, the eastern arm of the Vistula. The town was formerly surrounded with walls and mounds, of which, however, there are now but few remains. Of the numerous churches, the most remarkable is the Marienkirche, erected in the 14th century. The gymnasium, founded in the year 1536, contains the town library. There are likewise several well-conducted educational and charitable institutions. Among its manufactures are machinery, linen and cotton cloths, leather, tobacco, soap, and chicory. There are also oil manufactories, iron foundries, breweries, dye and print works, and a shipbuilding yard. E. was founded about the beginning of the 13th c. by colonists from Lübeck and Bremen, who settled round the fortress erected by the German knights. After various vicissitudes it was annexed to Prussia in 1772, and after a period of decline, has again risen to a thriving condition. The larger vessels unload at Pilau, which serves as the harbor of Elbing. Pop. '90, 41,578.

ELBOW. See ARM.

ELBOW-PIECES, in armor, or *coudières*, were the metal-plates used to cover the junction of the rere-brace and vant-brace, by which the upper and lower half of the arm were covered. They increased to an enormous size, as in the effigy of sir Thomas Peyton, in Isleham church, but again decreased to their normal size. An *elbow gauntlet* was a gauntlet of plate reaching to the elbow, adopted from the Asiatics in the 16th century.—Fairholt's *Costume in England*, p. 494.

ELBURZ', a lofty mountain-range that runs longitudinally along the entire southern border of the Caspian sea. It frequently divides itself into subordinate parallel ridges, inclosing extensive and fertile valleys, many of which are well inhabited and carefully cultivated. Demavend (q.v.), said to be 21,000 ft. in height, is one of the highest summits.—**ELBURZ**, or **ELBRUZ**, is also the name of one of the summits of the Caucasus, 18,500 ft. high.

ELCHE (anciently, *Alíce*, or *Illice*), a t. of Spain, in the province of Alicante, and 13 m. s.w. of the town of that name, is picturesquely built on both sides of a steep ravine, near the Elda, a tributary of the Segura, and about two leagues from the sea. It has an oriental appearance. The climate is eastern, winter is unknown, and around the town rises a huge encircling plantation of palms; the Arab alone is wanting to complete the likeness to an eastern city. E. is a flourishing town, is well built, its streets in general are wide and clean, and it has numerous squares and public walks. The church of Santa Maria is an imposing edifice, with a large dome, five gates, a famous organ, and a tabernacle made of precious marbles. The dates gathered from the palm plantation around E. are exported from Alicante; they are not so good as Barbary dates, though sold as such. Its manufactures are linens, woollens, cottons, brandy, wine, cigars, oil, soap, etc.; in these articles, and in cattle, rice, and wool, there is a considerable trade. Pop. 1887, 23,854.

ELCHINGEN, a village of Bavaria, on the left bank of the Danube, about 8 m. n.e. of Ulm. It is noteworthy as the scene of a battle fought on the 13th Oct., 1805, between the French under Ney and the Austrians under Laudon, in which the latter were defeated. Ney's victory obtained for him the title of duke of Elchingen.

ELCHO, FRANCIS WEMYSS-CHARTERIS-DOUGLAS, Lord, b. Aug. 4, 1818, is eldest son of the eighth earl of Wemyss. This ancient Scottish family has a traditional descent assigned it from the house of Macduff, earl of Fife. Sir Michael de Wemyss in 1290 was sent to Norway by the lords of the regency in Scotland to conduct the young queen Margaret to her dominions. He swore fealty to Edward I. in 1296, and was a witness to the act of settlement of the crown of Scotland by king Robert I. at Ayr in 1315. From him lineally descended Sir John Wemyss, who was created a baronet in 1625; raised to the peerage of Scotland as baron Wemyss of Elcho in 1628; and advanced to the dignities of earl of Wemyss in the county of Fife, and lord Elcho and Methel, in 1633. Although indebted for his honors to Charles I., he was engaged during the subsequent civil wars on the side of the parliament. David, fourth earl, was appointed by queen Anne lord-high-admiral of Scotland, and one of the commissioners for concluding the treaty of union. The eldest son of the fifth earl having taken part in the rising of 1745, escaped to France after the battle of Culloden, and was attainted. At his death, the family honors were taken up by his brother Francis, sixth earl, who, having inherited the estates of his maternal grandfather, Col. Charteris, of Amisfield, co. Hadding

ton, had assumed the surname of Charteris before that of Wemyss. Francis, his grandson, became heir to the titles of earl of March, viscount Peebles, and baron Douglas of Niddpath, on the demise of William, third earl of March, and fourth duke of Queensberry, in 1810. In 1821, he was made baron Wemyss of the United Kingdom, by which title the possessor of the earldom holds his seat in the house of lords. A parliamentary reversal of the attainder of lord Elcho, obtained in 1826, put beyond question the succession to the Scottish honors. His son, the present earl, is lord-lieut. of Peebleshire, and lieut.-gen. of the royal archers.

Lord E. was educated at Christ Church, Oxford, where he graduated B.A. in 1841. He was returned to the house of commons as M.P. for East Gloucestershire from July, 1841, to Feb., 1846, and has sat for Haddingtonshire since 1847 to the present time. He took his seat on the conservative benches, but accepted office, with other members of the party of sir Robert Peel, in the coalition government of the earl of Aberdeen, and was a lord of the treasury from Jan., 1853, to Feb., 1855. In 1859, the menacing attitude of France, and the periodical recurrence of seasons of alarm, caused by the unprotected state of our shores, and the possibility of invasion, led to an organization of rifle volunteers in Great Britain. In this movement, lord Elcho took the earliest and most prominent part. He organized a regiment of London Scottish volunteer rifles, of which he was appointed maj. in 1859, and lieut.-col. in 1860, and went to Hythe barracks to receive instruction in the use of the Enfield rifle, and to the camp at Shorncliffe, in order to become familiarized with regimental duties and brigade movements. Lord Elcho also projected the national association for the promotion of rifle-shooting, the first shot at which was fired by her majesty, July 2, 1860, at Wimbledon. He and other patriotic noblemen and gentlemen associated with him in the volunteer movement, had the satisfaction of assisting, in 1860, at two grand reviews by the queen of various brigades of volunteer rifle corps—of 20,000 men in Hyde park, and 22,000 men in Edinburgh. The war office assisted in organizing the force, and thus was consolidated the volunteer army of Great Britain, who adopted as their motto "Defence, not Defiance." The national rifle association, mainly under the auspices of earl Spencer and lord E., has become an established institution—the center and keystone of the volunteer movement. Lord E. has since given additional efficiency to the volunteer movement by watching, in his place in parliament, its financial relations with the government. In 1865, lord E. took a more active part in parliamentary politics than had been possible during his labors in promoting the volunteer movement. He spoke against the £6 franchise proposed by Mr. Baines, and gave notice of a motion for a royal commission to examine into the extension of the franchise. When the government of earl Russell brought in the reform bill of 1866, lord E. organized a secession from the Whig party, under the leadership of earl Grosvenor, which was nicknamed the "Cave of Adullam," but which succeeded in defeating the bill, and displacing the government. Lord Derby, on his accession to the premiership, offered a post in his government to lord E., but the offer was declined. In 1867, his party found themselves powerless to prevent the passing of a more democratic reform bill than that which in the previous year they had thrown out. Lord E. is a fluent and pleasant speaker, and he is exceedingly popular with the volunteers both of England and Scotland. Lord E. is an LL.D. of Edinburgh university. In 1871, he published *Letters on Military Organization*. In 1883, on the death of his father, he succeeded to the earldom of Wemyss.

ELDER, *Sambucus*, a genus of plants of the natural order *caprifoliaceæ*, consisting chiefly of shrubs and trees, with pinnate leaves, small flowers of which the corolla is wheel-shaped and 5-cleft, and 3-seeded berries. The wood of the young shoots contains a very large pith. The species are very widely distributed.—The COMMON E. (*S. nigra*), the *bouree* of the Scotch, is a native of Europe, the n. of Asia, and the n. of Africa. It is found in all parts of Britain. It is a very large shrub, sometimes a small tree, with rather large leaves, and large terminal cymes of cream-colored flowers, which are followed by small black—or rarely whitish—berries. Its leaves and young shoots diffuse a narcotic odor, and it is said to be dangerous to sleep under its shade. The inner bark has a bitter acrid taste. The leaves possess the same properties in a rather milder degree. The flowers have a peculiar sweetish and rather sickening smell, but are much used for making a distilled water—*elder-flower water*—which has a very agreeable odor, and is employed both in perfumery and confectionery. Distilled with water alone, they yield a volatile oil, which, on cooling, assumes a buttery consistence. A popular cooling ointment is made by boiling them in lard. They are also used for imparting a flavor to currant-wine and jelly, being added at the time of a slight fermentation which takes place in the spring of the year, after the currant-wine is made; and a wine is made from them which in scent and flavor resembles Frontignac. The clustered flower-buds are pickled, and used like capers. A grateful wine, well known in England, especially about Christmas, is made from the berries; and in some parts of Kent there are large plantations of E. to supply the London market for its manufacture. It is generally drunk hot or *muddled*. The berries are subacid and sweetish, with a rather unpleasant flavor. A rob made from them is a gentle aperient, diuretic, and sudorific, easily administered to children. In some parts of Germany, the poorer people use them as an ingredient in soups. They are said to be used to no small extent in England in the

adulteration of port wine, and the manufacture of spurious port wine.—The wood of the E. is yellow; that of old trees is very hard and tough, takes a fine polish, is used by turners, and as a substitute for box-wood in making mathematical instruments and other articles. Tops of fishing-rods are sometimes made of it. The pith of the young shoots, being very light, is generally used to make pith-balls for electrical experiments. Toys for children are also made of it; and few boys are unacquainted with the use of E. branches, from which it has been expelled, for making pop-guns. The E. is very useful as a screen-fence near the sea and in other exposed situations, as it grows with remarkable vigor, and makes great shoots, the destruction of the more tender and less matured parts of which in winter only tends to make it more bushy and useful for shelter. It is readily propagated by portions of its shoots stuck into the ground.—The SCARLET-FRUITED E. (*S. racemosa*), a native of the s. of Europe and of Siberia, much resembles the common E., but has softer and more herbaceous shoots, remarkably large buds, which are conspicuous in winter, and racemes of greenish-white flowers, which are followed by scarlet berries, the racemes of ripe fruit having much the appearance of beautiful pieces of coral. It is a frequent ornament of shrubberies in Britain, and when in full fruit, is almost unrivaled in beauty, but more frequently produces its fruit in cold districts than in those where the milder winter induces it to flower before the spring frosts are over. The juice of its berries is a powerful sudorific.—The DWARF E., or DANEWORT (*S. ebulus*), is a rather rare British plant, a coarse, herbaceous plant, with fetid smell. The inner bark has been employed in dropsical complaints as a hydragogue cathartic, and is given in the form of a decoction prepared by boiling down 1 oz. of the bark in 2 pints of water till the whole is concentrated to 1 pint. The dose is about 4 fluid ounces. In smaller quantities, it is useful as an aperient in certain chronic disorders. The flowers are white when freshly plucked, but become yellow in drying, and consist of a volatile oil, certain gummy, resinous, albuminous, and saline matters, and are stimulant and sudorific. They are employed in the preparation of elder-flower water by adding 2 gallons of water and 3 ozs. of rectified spirit to 10 lbs. of the flowers, and distilling off about 1 gallon. It is a good perfume. White elder ointment is procured by boiling equal weights of lard and elder flowers, and pressing through a cloth. It has an agreeable odor, and is employed as a cooling application to flesh. *S. canadensis* and *S. pubens* are North American species; the former, which is very common along roadsides and fences, resembles *S. nigra* closely, and *S. pubens* approaches *S. racemosa*, being very showy when in fruit. *S. glauca* of the Pacific states, and *S. mexicana* of the south-west are larger species.

ELDER, an office-bearer in Presbyterian churches. The name is an exact translation of the Greek *presbyteros*, which occurs frequently in the New Testament, and from which the English word *priest* is derived. That the *presbyteroi* of the churches of the apostolic age were not *priests* in the special sense of that word, in which it denotes a person appointed to offer sacrifice on behalf of others, and to appear for them before God, is admitted by Protestants in general; but there remains much division of opinion as to the precise meaning of the term, and the bearing of the passages in which it occurs on the subject of church government. See BISHOP, INDEPENDENTS, and PRESBYTERIANISM. All are agreed, indeed, that *bishops* and all pastors of congregations are included among *elders* in the Scriptural use of the term; but the ordinary use of it is now limited to Presbyterian churches, and in them it has become the usual designation of the office-bearers associated with the minister of each congregation in the care and oversight of the flock. The argument for this class of office-bearers will be found briefly stated in the article PRESBYTER. They exist in the greater number of the churches of the reformation; and even in the church of England, bishop Burnet states that their introduction was only prevented by queen Elizabeth's dislike to a proposal, in which, with Burleigh and others of her advisers, she saw danger of an abatement of her prerogative, "since, if the concerns of religion came into popular hands, there would be a power set up distinct from hers, over which she could have no authority." In some Protestant churches, elders are appointed only for a certain term of office; but more generally it is until death, resignation, removal from the bounds of the congregation, or deposition. The appointment of elders takes place variously: in the established church of Scotland, they have generally been nominated by the kirk-session (consisting of the minister and elders); in the other Presbyterian churches of Britain and America, they are elected by the congregation. In most of the churches of the continent of Europe, which have any kind of connection with the state, there is some regulation of the civil law or of the civil authorities in this matter. The ordination of elders takes place in the congregation, but usually without imposition of hands; a difference between the mode of ordination of elders and ministers for which it is not easy to account, and which has certainly tended to produce a general impression that a greater difference of office subsists than the advocates of Presbyterianism admit. In the established church of Scotland, the elders have very generally discharged the functions of deacons (q. v.), at least as much as those which, according to the theory of Presbyterianism, belong to their own office; an example which, until recently, was almost universally followed in other Presbyterian churches. According to the *Second Book of Discipline* of the church of Scotland, it is the duty of elders to watch over the spiritual welfare of the people, to admonish, to visit the sick, to assist in the examination of persons seeking admission to the Lord's table,

etc. Elders, along with ministers, compose all the courts or assemblies of the Presbyterian churches, and have equal votes on all questions.

ELDER, WILLIAM HENRY, D.D., b. Baltimore, in 1819; educated in that city and at the coll. of the Propaganda, Rome; was prof. and pres. of Mt. St. Mary's coll., Emmetsburg, Md.; and was consecrated Rom. Cath. bishop of Natchez, Miss., 1857. He endeared himself to the people of his diocese by his labors among the sick and wounded during the late civil war. For some time coadjutor to abp. Purcell, he was elevated to the archiepiscopal see of Cincinnati, upon the death of the latter prelate, 1882.

ELDEST SON OF THE CHURCH (*Fils aîné de l'église*), a title applied to the king of France with the same general motive as that with which he was styled Most Christian King, i.e., to show his relation to the Church. The title, Eldest Son of the Church, is not as common as Most Christian King.

ELDON, BARON, Lord High Chancellor of England. John Scott, better known as lord Eldon, was b. 4th June, 1751, in Love lane, Newcastle, of obscure but respectable parents. William Scott, his father, began life as an apprentice to a "fitter," a sort of water-carrier and broker in coal; later in life, he became a "fitter" himself, and kept a public-house near the quay, to supply drink to his keelmen on the truck-principle; he engaged also in speculations in shipping and marine insurance. By his various occupations he became wealthy, and died worth about £20,000. John Scott's mother was a daughter of a Mr. Atkinson of Newcastle, and to her, lord Campbell, in his *Life of Lord Eldon*, traces the talent inherited by her sons William and John. William became baron Stowell, and was the head for many years of the high court of admiralty. See **STOWELL, BARON**.

John Scott was educated under the Rev. Hugh Moises, at the grammar-school, Newcastle, and as a boy gave no promise of his subsequent splendid career. On finishing his education under Mr. Moises, he, on 15th May, 1766, entered University college, with a view to the church; the following year he obtained a fellowship, and in the summer of 1771, won the prize for the English essay, but did not otherwise distinguish himself. A clandestine marriage, into which he entered with a Miss Surtees in 1772, nearly ruined him; however, by the advice of his brother, he returned with his wife to the university. Here, during the year of grace, he lived on his fellowship and gains as a private tutor; and the year expiring without a church living falling vacant, he betook himself to the study of law. In 1776, he was called to the bar. By this time, his wife's friends had become reconciled to her, and made her some provision; and by the death of his father, in the year of his passing at the bar, E. found himself in possession of £3,000. On his own and wife's money, he found he could just manage to live, and so settled on the northern circuit. His success on his first circuit was not great; but in his second year his prospects, through the aid of his brother and friends, began to brighten. It was not, however, till 1780, that prosperity could be said to have dawned upon him. A happy chance then occurred of showing both his talents and powers of work. The result was speedy affluence. Business poured in upon him; and by 1787, his practice at the equity bar had so increased, that he was forced to give up the eastern half of his circuit.

With success in his profession, E.'s ambition expanded, and he became political. A silk-gown, and then, through the favor of lord Thurlow, a seat in parliament, were but steps toward knighthood and the post of solicitor-general conferred on him by Pitt. From this point, his progress was secure, and effected much in the way in which political lawyers usually succeed. In 1793, he became attorney-general. In 1799, the office of chief-justice of the court of common pleas falling vacant, his claim to it was not overlooked; and after 17 years' service in the house of commons, he entered the house of peers as baron Eldon. In 1801, on the formation of the Addington ministry, E. ascended the woolsack—a post given to him nominally because of his great anti-Catholic zeal, but really because of his part in the intrigue which ousted his old patron Pitt from office. From this time till 1827, with little intermission, E. continued to occupy the woolsack under successive governments. He was in succession chancellor under Addington, Pitt, and lord Liverpool; and when, after the two brief administrations of Canning and Goderich, the duke of Wellington constructed a cabinet, E. again expected the woolsack, and resented his non-appointment to it. His love of office indeed continued to the last, and in 1835, we find him actually in hopes of office under Peel. In 1834, he ceased to speak in parliament. In 1821, E. was made an earl by George IV. He died, Jan. 3, 1838.

E. is said to have been a man of very winning and courtly manners, and of a handsome, prepossessing appearance. In the circle of his friends he is said to have been irresistible, and probably to the charms of his manner his success in life was somewhat owing. His career amply proves that he was a man of the greatest talent, sagacity, and power of managing men. He was undoubtedly a great lawyer, and his judgments, which have been much praised for their accuracy, fill a small library; at the same time, he took so long to arrive at them, that he has been charged with having caused more injustice by delay than worse judges by the iniquity of their decisions.

EL DORADO (the golden or rather the gilded land) existed originally in the imaginations of the Spanish conquerors of America, whose insatiable avarice loved to dream of richer rewards than those of Mexico and Peru. The Castilians found an imitator in sir Walter Raleigh, who twice visited Guiana in quest of this fabulous region. The name has at last made for itself an abiding-place beyond the furthest limits of Spanish possession. It indicates a co. in the n.e. of California, in which the town Coloma stands, near the spot where the first discovery of gold was made in that state. The district in question is drained by some of the northern feeders of the Sacramento, which empties itself into the bay of San Francisco.

ELDORA'DO, a co. in e. California, reached by the Southern Pacific railroad, drained by branches of the American and the Cosumne rivers; 1790 sq. m.; pop. '90, 9232, includ. Chinese. It is mountainous, and much of the surface is yet covered with forests of oak and pine. The Sierra Nevada mountains cross the e. part. In the low lands the soil is fertile; but gold-mining is the leading business. Co. seat, Placerville.

ELDREDGE, NATHANIEL BUEL; b. N. Y., 1813; practiced medicine for 15 years; then law for 20 years; served through the civil war and became a colonel of volunteers; and afterward engaged in farming. He was a member of the Mich. legislature, 1848; and was elected to congress as a democrat in 1882 and 1884. He d. in 1893.

EL'EANOR OF AQUITAINE, 1122-1204, Queen of France and afterwards of England, was the daughter of William IX., the last duke of Guienne. She succeeded her father in 1138, and was married the same year to Louis VII. of France. Her lively and somewhat frivolous manners, and her love of pleasure, did not fit her for the society of a husband who was naturally austere, and who from religious conviction had adopted many ascetic habits. They became gradually estranged, and in the Holy Land, whither she accompanied him in 1147, their quarrels became so frequent and so bitter that at last a divorce was agreed upon, which, on their return to France, was completed under the pretext of kinship, 1152. Six months afterwards she gave her hand and her possessions to Henry of Navarre, who in 1155 mounted the throne of England as Henry II. That the duchy of Guienne should thus become permanently annexed to the English crown was naturally displeasing to Louis, and the indirect consequence of his displeasure was protracted wars between France and England. In other respects, the marriage had unhappy consequences. The infidelities of Henry, and the special favors he showed to one of his mistresses, so greatly aroused Eleanor's jealousy that she incited her son Richard to rebellion, and also intrigued with her former husband to get him to lend his influence to the great league formed against Henry in 1173. Her son had fled to Louis, and she was preparing to follow him when she was arrested and placed in confinement, where she remained till the death of her husband, 1189. As soon as he died she regained her liberty, and reigned as regent until Richard's arrival from France. She also held this position during Richard's absence in the Holy Land, for which he left in 1190. After his escape in 1194 from the captivity which befell him as he was returning home, she retired to the abbey of Fontevrault, where she died. There is a curious story told of Eleanor by Higden, monk of Chester, relating to one of Henry's mistresses known as "Fair Rosamond," of whom the queen was extremely jealous. Higden says: "She was the fayre daughter of Walter lord Clifford, concubine of Henry II., and poisoned by queen Eleanor, A.D. 1177. Henry made for her a house of wonderful working, so that no man or woman might come to her. This house was named Labyrinthus, and was wrought like unto a knot in a garden called a maze. But the queen came to her by a clue of threddele, and so dealt with her that she lived not long after."

ELEATIC SCHOOL. The group of ancient Greek philosophers so called begins with Xenophanes of Colophon, who settled in Elea, a Greek city of lower Italy (whence the name), and includes Parmenides and Zeno, who both belonged to Elea, and also Melissus of Samos. The most flourishing period of this philosophy falls from 540 to 460 B.C. In opposition to the physical philosophy of the Ionic school, and to the doctrine of Heraclitus (q.v.), who denied all being or existence, the Eleatic philosophers made this conception of pure being, unmixed with all marks or properties derived through the senses, the foundation of all their speculations. As being, one and unchangeable, seemed to them to exclude all plurality and alteration of appearances, they gave up, with remarkable consistency, all attempts to explain scientifically the world as we see it; and the startling abruptness of their simple fundamental principle, taken in conjunction with the opposite doctrine of Heraclitus, was one of the chief causes that led Plato at a later period to attempt a reconciliation between the notions of *being* and *becoming*, or of absolute existence and phenomena.

ELECAMPANE, *Inula*, a genus of plants of the natural order *compositæ*, sub-order *corymbifera*, nearly allied to *aster*. The only important species is the common E. (*I. Helenium*), a native of damp meadows in the middle and s. of Europe, rather rare in Britain. This plant was formerly much cultivated for its root, which was used in

medicine, and still retains its place in the pharmacopœias, although comparatively neglected. The root has a faint aromatic odor; and a bitter, acrid, and somewhat camphor-like taste. It acts as a gentle stimulant to the organs of secretion, promotes expectoration, and is diuretic and sudorific. It contains a peculiar principle called *inulin*, which resembles starch, but is deposited unchanged from its solution in boiling water on its cooling, and gives a yellowish instead of a blue color with iodine; also another peculiar principle called *helenin*, or *elecampane camphor*, which resembles camphor in some of its properties.

ELECTION denotes, in theological language, the divine act by which certain individuals are chosen to salvation in Christ, and the doctrine of election is the doctrine of "God's everlasting purpose, whereby He hath constantly decreed by his secret counsel to deliver from curse and damnation those whom He has chosen in Christ out of mankind, and to bring them by Christ to everlasting salvation as vessels made to honor." These words, taken substantially from the articles of religion of the church of England, may be said to represent, in a moderate form of expression, the orthodox doctrine on the subject of election. Besides this form of the doctrine, there is a lower and a higher form of it, which, apart from technical and polemical language, may be said to spring—the one from the supposed subordination of the divine act or purpose to the divine foreknowledge of human conduct—the other from the exaltation of the divine act or purpose into an absolute and arbitrary supremacy, having no relation whatever to human will or conduct. The former of these extremes corresponds to the Pelagian or Arminian doctrine of election, the latter to the hyper-Augustinian or Calvinistic. The Arminian aims to condition or limit the absolute character of the divine act in redemption in some way or another; the Calvinist aims to give to this act the most arbitrary and irresponsible character. The one, while not altogether repudiating a doctrine of election, yet gives such prominence to the human conditions of the elective purpose, as (in the view of Calvinists) to destroy it altogether; the other maintains not only a doctrine of election or predestination, but also the correlative doctrine of reprobation. In the view of the Arminian, salvation is within the choice of the human will; in the view of the Calvinist, the human will is of little or no account—the decree of God is everything—and this decree (which Calvin admitted to be a "*decretum horribile*") absolutely determines some to everlasting life and some to everlasting death. The separation has its source in the will of God, and not in the moral conditions of mankind.

It is obvious, in the mere statement of such views, how audaciously theology has sought to settle questions beyond all human scrutiny and settlement. In the nature of things, the relations between the divine and human will appear indeterminable; and, notwithstanding all the labor of inquiry devoted to such subjects in the past history of opinion, it cannot be said that any advance of thought has been made regarding them. If the mere logic of the question be kept in view, the Calvinistic opinion has the advantage over the Arminian—setting out, as it does, from the recognition of the divine will as absolutely supreme, and the source, consequently, of all subordinate action—a thought which is in the highest degree logically consistent. But then the moral perplexities which arise out of the practical application of this view, and the ease with which it may be perverted into a fanatical and dangerous error, will always repel many minds from its adoption.

Although the expressions election, elect, etc., are frequent in Scripture, it cannot be said that what is known as the theological doctrine of E. was acknowledged by the Christian church till the time of Augustine. The Greek fathers confined their attention almost entirely to questions purely theological—that is to say, relating to the character and constitution of the Godhead. Gnosticism and Arianism, the two main forms of heretical opinion before Augustine, indicate the channels into which theological discussion had previously run. It was not till the Latin mind had taken up this discussion, that the more practical question of the relation of the divine and human will in redemption came to receive special attention. The controversy between Pelagius and Augustine in the beginning of the 5th c., brought out almost all the aspects of the question which have since, at successive epochs in the history of the church, risen into renewed prominence. The contests between the Scotists and Thomists in the 14th c., between the Arminians and Calvinists, and, within the Roman church, between the Jansenists and Molinists in the 17th c., are recurring expressions of the same radical conflict or divergency of opinion. The spirit of modern theology is adverse to the logical disquisitions engendered by such discussions, and finds its more appropriate and useful field of labor in the province of critical and historical inquiry.

ELECTION, in law, the choice between alternating and incompatible rights or claims; as when an insurance company, according to the terms of its policies, elects whether it will pay in cash for property insured and destroyed, or replace the same in kind and value. This right of alternative choice is of special importance in equity practice, in which instances are constantly occurring.

ELECTION, in politics, is the choice of public officers by popular suffrage, in distinction from "appointment" of those in a lower by those in a higher grade. Popular elections were not unknown in ancient times and in the middle ages. The system has had a slow development in England, and has been imitated and improved by other

countries. In the United States, elections are of three grades—1. Local or municipal; 2. State; 3. National. State elections are for executive and legislative, and sometimes for judicial officers. National elections are held once in two years for the choice of members of congress, and once in four years for the choice of electors of president and vice-president of the United States. Elections are also sometimes held for the adoption or rejection of state constitutions or of amendments of the same. The provisions for local, municipal, and state elections are made in each state by the legislature thereof. The arrangements of national elections are made in part by state and in part by the national authority, the latter being supreme within its sphere, defined by the constitution.

ELECTION CAKE. A rich loaf-cake, which, in the days when Connecticut held an annual election, formed an important part of the refreshments offered to visitors to the state capital. The influx of relatives and friends at that time was the occasion of a generous hospitality, and inasmuch as the preparation of large batches of "election cake" was usually begun a week beforehand, and the ambitious housewife often had to sit up all night to watch her oven, no more important event, so far as the kitchen was concerned, occurred during the year.

ELECTION COMMITTEE. See PARLIAMENT

ELECTION LAWS. See PARLIAMENT ; BALLOT.

ELECTION OF SCOTTISH PEERS. See PARLIAMENT, PEER.

ELECTIVE STUDIES in colleges and universities are required studies of which the student must choose one or more, in distinction from prescribed studies in which there is no choice; sometimes, less properly, called optional studies, the latter name being better applied to extra studies which may be taken or not. In view of the modern additions to the departments of knowledge some colleges have established separate courses in arts, science, letters, philosophy, etc., with corresponding degrees. Other colleges, while giving the old degree of Bachelor of Arts, allow the student a choice of equivalent studies leading to this degree. According as the college regards its training as real rather than gymnastic it will admit electives, consideration being had of the age of the students as a factor in their ability to judge for themselves and in their fitness to pursue special studies. The univ. of Virginia, founded 1819, was one of the first to give electives. Harvard college, during the period 1825-56, made about one-fourth of the studies elective, beginning with Latin, Greek, and modern languages, and enlarging the list to include in the senior year also mathematics and the sciences. The system was again introduced, 1867, and has been continued with enlargement, and (as is claimed) with success. At present prescribed studies occupy the larger part of the Freshman year, but in the last three years only certain written exercises are prescribed. In Johns Hopkins univ. the student selects his studies under the guidance of a member of the faculty who acts as his adviser, without whose consent he may not enter any class. At Cornell there are no electives in the Freshman year; in the Sophomore year four hours a week out of 15 are elective; in the Junior and Senior years an average of 11 hours. Electives are also given in the scientific and other courses. In the univ. of Michigan, 24 "full courses" are required for the degree of A.B.; of these 10½ are prescribed. Of the 26 "full courses" required for the other degrees, 13½ are prescribed for science, 10½ for philosophy, etc. At Columbia, Princeton, and Yale, the electives are practically confined to the last two years of the course. In Yale, the plan introduced, 1885, enlarges the range of electives, but not by permitting immature students to choose or refuse every separate study. Instead of this, the studies are arranged in groups balanced and adjusted according to long experience, and these groups, varying widely in their total effect, are at the due time offered to the student's choice. From this new elective system much is expected, as combining the advantages of the old and the new. The whole question of elective studies in our colleges must be regarded as in a state of flux: distinguished authorities are ranged on either side. See COLLEGES, AMERICAN.

ELECTORAL COLLEGE, in the political system of the U. S., is the name given to the body of electors in each state who have been chosen to vote for a president and vice-president. These electors are chosen simultaneously by the people of every state on the Tuesday next after the first Monday in November. Their number is equal to the whole number of representatives which the state sends to both branches of congress; they are to meet at some place designated by the legislature of their state on the first Wednesday in December, and vote by ballot for president and vice-president, of whom one, at least, shall not be a resident of the same state with themselves. Each electoral college then makes a list of the names of all its candidates for president and vice-president, with the number of votes for each; the list is signed and certified by every member of the college, is authenticated by the governor of the state, and transmitted to the president of the senate of the U. S. On the second Wednesday in February the electoral votes are opened and counted in presence of both houses of congress, assembled in the chamber of Representatives, and the result is announced by the president of the senate. The persons who receive the highest number of votes, respectively, for the offices of president and vice-president are declared elected, provided they have received a majority of all the votes. In case of a

tie, the house of representatives, voting by states, each state having one vote, is to choose between the equal candidates for president, a majority of all the states being necessary to a choice. The senate has the power to choose in case of a tie on vice-president. In the same way, in case there is no tie, but the leading candidates fail to receive a majority of all the votes, the election for president is thrown into the house, and that for vice-president into the senate. Under the constitution as originally framed the electoral colleges did not designate their choice for president or vice-president, but when the total votes were counted by the president of the U. S. senate, the candidate receiving the highest number of votes was declared to be elected president, and his nearest competitor vice-president. But the 12th amendment to the constitution changed the mode of voting for the two officers, the electors being required to vote separately for president and vice-president.

The constitution states that "each state shall *appoint*" the electors "in such manner as the legislature thereof may direct;" and it had not been expected that they would be voted for. The electors, too, were to name and vote for such candidates as they individually preferred; but, never exercising this power, they always cast their votes in bulk for the candidates previously nominated in the national convention of their respective parties. The people, consequently, elect the president and vice-president in their state capacity, and the college is a cumbrous machine for formally conveying to Washington the wishes of the majority. The immediate cause of this change was the passage, 1801, of the 12th amendment, ostensibly to minimize the chances of a tie, but the result was that the president and vice-president were both chosen from the same party, and thus the fact of the existence of parties received its first constitutional recognition. Since 1801 the vote of an elector has been known with certainty several weeks before it is cast, and several months before it is officially announced. The electoral system has constantly endangered the state, on account of the absence, until recently, of any general law to govern the president of the senate in his canvass of the votes, and the tendency of congress to decide every case of doubt or disputed returns arbitrarily as it arose. Nothing was accomplished, however, until 1887, when a law was passed (approved February 3, 1887) to cover the contingency of rival electoral colleges and disputed returns. Under the terms of this act, each state is conceded to have the right of determining all controversies or contests regarding the appointment of its own presidential electors; and in case of any such contest, congress is to accept the state's settlement of the same as conclusive, and it cannot reject any electoral vote, duly certified, unless both houses concurrently decide that that vote has been irregularly given. If more than one return from a state is received, only those votes are to be counted which the state itself has endorsed as regular; but if the state has been unable to settle the question, owing to its having two or more rival sets of authorities, or from any other cause, then the two houses are to decide the dispute. In other words, the new law aims at preventing congress from setting aside or interfering in any way with the electoral returns from the various states, except in extreme cases, where the states have neglected or shown themselves unable to exercise their sovereign prerogatives in the matter. It is hoped that the law will prove an ample defense against all absolute danger pertaining to the electoral system; but no emendations can rid the system of its inherent faults. See CONVENTIONS, NATIONAL POLITICAL.

ELECTORAL COMMISSION, the body of men provided for by act of Congress, Jan. 29, 1877, to settle certain disputed questions in regard to the electoral votes of several states in the presidential election of 1876. The commission was composed of 5 senators, chosen by the senate; 5 members of the house of representatives, chosen by that body; and 5 associate justices of the supreme court, 4 of whom were designated by the act of congress, and the fifth selected by the four. The senate at the time was controlled by the republican party, the house of representatives by the democratic party, and there was thought to be danger of civil commotion in regard to certain questions likely to arise in the counting of the electoral votes of the several states in presence of the two houses. In these circumstances, a majority of each of the two political parties in congress, acting in a spirit of patriotism honorable to themselves and the country, agreed to create a commission to be constituted as above described, to which should be referred for judgment and decision the question which of two or more conflicting certificates received from any state of the votes cast by the electoral college of such state for president and vice-president in the election of 1876 was the certificate provided for in the constitution of the United States: the judgment of said commission in any matters referred to it, unless set aside by the concurrent action of the two houses of congress, was to be final. The proposed law was thereupon enacted, and in conformity with an understanding between the two political parties, the senate appointed 3 republicans, and 2 democrats, and the house of representatives 3 democrats and 2 republicans as members of the commission. Of the 4 associates of the supreme court who were named in the law, 2 were understood to be democrats and 2 republicans; and these selected, as the fifth associate justice to serve with them upon the commission, Mr. Justice Bradley, a republican. The commission was constituted as follows: Justices Clifford, Strong, Miller, Field, and Bradley; Senators Edmunds, Morton, Frelinghuysen, Thurman, and Bayard; and Representatives Payne, Hawton, Abbott, Garfield, and Hoar. Justice Clifford, by seniority of appointment to the bench, was by law president of the commission. As the counting of the electoral votes in the presence

of the two houses of congress proceeded according to custom, it was found that there were conflicting certificates from four different states—Florida, Louisiana, Oregon, and South Carolina; and the two houses were unable to agree in either case which certificate should be received as genuine. The certificates and accompanying papers were therefore successively referred to the commission, who proceeded to hear argument upon the questions involved. The result in each case was a decision of the commission, by a vote of 8 to 7—the vote following the exact line of party division in the body—that the certificate of the electoral votes cast for Hayes and Wheeler, the republican candidates for president and vice-president of the United States, was the certificate which contained the lawful electoral vote of said state, and that the other certificates were illegal and void. The republican senate concurred in this judgment in each case, while the democratic house of representatives dissented. The decision of the commission, therefore, according to the terms of the statute, became irrevocable, and the said electoral votes were counted accordingly; and Rutherford B. Hayes and William A. Wheeler were found duly elected, by a majority of one electoral vote, respectively president and vice-president of the United States for the term of 4 years, from the 4th of Mar., 1877. The controlling question before the commission was whether an electoral certificate being in form confessedly according to law, it was competent for congress or the commission to go behind the same and take evidence *abundant* in support of alleged irregularities and frauds committed before such certificate was issued. Upon this question the democrats in congress and in the commission took the affirmative, while the republicans took the negative.

ELECTORAL VOTES, as counted Monday, April 6, 1789, were as follows: George Washington, 69; John Adams, 34; Samuel Huntington, 2; John Jay, 9; John Hancock, 4; Robert H. Harrison, 6; George Clinton, 3; John Rutledge, 6; John Milton, 2; James Armstrong, Edward Telfair, Benjamin Lincoln, each 1.—The votes, as counted Wednesday, Feb. 13, 1793, were: George Washington, 132; John Adams, 77; George Clinton, 50; Thomas Jefferson, 4; Aaron Burr, 1.—The votes, as counted Wednesday, Feb. 8, 1797, were: John Adams, 71; Thomas Jefferson, 68; Thomas Pinckney, 59; Aaron Burr, 30; Samuel Adams, 15; Oliver Ellsworth, 11; George Clinton, 7; John Jay, 5; James Iredell, 3; Samuel Johnston, George Washington, John Henry, each, 2; Chas. C. Pinckney, 1.—The votes, as counted Wednesday, Feb. 11, 1801, were: Thomas Jefferson, Aaron Burr, each, 73; John Adams, 65; C. C. Pinckney, 64; John Jay, 1.—The votes, as counted Wednesday, Feb. 13, 1805, were: for *President*, Thomas Jefferson, 162; C. C. Pinckney, 14; for *Vice-President*, George Clinton, 162; Rufus King, 14.—The votes, as counted Wednesday, Feb. 10, 1813, were: for *President*, James Madison, 128; De Witt Clinton, 89; for *Vice-President*, Elbridge Gerry, 131; Jared Ingersoll, 86.—The votes, as counted Feb. 12, 1817, were: for *President*, James Monroe, 183; Rufus King, 34; for *Vice-President*, Daniel D. Tompkins, 183; John E. Howard, 22; James Ross, 5; John Marshall, 4; Robert G. Harper, 3.—The votes, as counted Feb. 14, 1821, were: for *President*, James Monroe, 231; John Q. Adams, 1; for *Vice-President*, Daniel D. Tompkins, 218; Richard Stockton, 8; Daniel Rodney, 4; Robert G. Harper, Richard Rush, each, 1.—The votes, as counted Feb. 9, 1825, were: for *President*, John Q. Adams, 84; William H. Crawford, 41; Andrew Jackson, 99; Henry Clay, 37; for *Vice-President*, John C. Calhoun, 182; Nathan Sanford, 30; Nathaniel Macon, 24; Andrew Jackson, 13; Martin Van Buren, 9; Henry Clay, 2.—The votes, as counted Feb. 11, 1829, were: for *President*, Andrew Jackson, 178; John Quincy Adams, 83; for *Vice-President*, John C. Calhoun, 117; Richard Rush, 83; William Smith, 7.—The votes, as counted Feb. 13, 1833, were: for *President*, Andrew Jackson, 219; Henry Clay, 49; John Floyd, 11; William Wirt, 7; for *Vice-President*, Martin Van Buren, 189; John Sergeant, 49; William Wilkins, 30; Henry Lee, 11; Amos Ellmaker, 7.—The votes, as counted Feb. 8, 1837, were: for *President*, Martin Van Buren, 170; William H. Harrison, 73; Hugh L. White, 26; Daniel Webster, 14; Willie P. Mangum, 11; for *Vice-President*, Richard M. Johnson, 147; Francis Granger, 77; John Tyler, 47; William Smith, 23.—The votes, as counted Feb. 10, 1841, were: for *President*, William H. Harrison, 234; Martin Van Buren, 60; for *Vice-President*, John Tyler, 234; Richard M. Johnson, 48; Lyttleton W. Tazewell, 11; James K. Polk, 1.—The votes, as counted Feb. 12, 1845, were: for *President*, James K. Polk, 170; Henry Clay, 105; for *Vice-President*, George M. Dallas, 170; Theodore Frelinghuysen, 105.—The votes, as counted Feb. 14, 1849, were: for *President*, Zachary Taylor, 163; Lewis Cass, 127; for *Vice-President*, Millard Fillmore, 163; William O. Butler, 127.—The votes, as counted Feb. 9, 1853, were: for *President*, Franklin Pierce, 254; Winfield Scott, 42; for *Vice-President*, William R. King, 254; William A. Graham, 42.—The votes, as counted Feb. 11, 1857, were: for *President*, James Buchanan, 174; John C. Fremont, 114; Millard Fillmore, 8; for *Vice-President*, John C. Breckinridge, 174; William Dayton, 114; A. J. Donelson, 8.—The votes, as counted Feb. 12, 1861, were: for *President*, Abraham Lincoln, 180; John C. Breckinridge, 72; Stephen A. Douglass, 12; John Bell, 39; for *Vice-President*, Hannibal Hamlin, 180; Joseph Lane, 72; Herschel V. Johnson, 12; Edward Everett, 39.—The votes, as counted Feb. 8, 1865, were: for *President*, Abraham Lincoln, 212; George B. McClellan, 21; for *Vice-President*, Andrew Johnson, 212; George H. Pendleton, 21.—The votes, as counted Feb. 10 1869, were: for *President*, Ulysses S. Grant, 214; Horatio Seymour, 80; for *Vice-President* Schuyler Colfax, 214; Frank P. Blair, Jr., 80.—The votes, as counted

Feb. 12, 1873, were : for *President*, Ulysses S. Grant, 286 ; Thomas A. Hendricks, 42 ; Horace Greeley, 18 ; Charles J. Jenkins, 2 ; David Davis, 1 ; for *Vice-President*, Henry Wilson, 286 ; B. Gratz Brown, 47 ; G. W. Julian, A. H. Colquitt, each, 5 ; J. M. Palmer, T. E. Bramlette, each, 3 ; W. S. Groesbeck, W. B. Machen, N. P. Banks, each, 1.—The votes, as counted Feb. 14, 1877, were : for *President*, Rutherford B. Hayes, 185 ; Samuel J. Tilden, 184 ; for *Vice-President*, William A. Wheeler, 185 ; Thomas A. Hendricks, 184.—The votes, as counted Feb. 9, 1881, were : for *President*, James A. Garfield, 214 ; Winfield S. Hancock, 155 ; for *Vice-President*, Chester A. Arthur, 214 ; William H. English, 155.—The votes, as counted Feb. 11, 1885, were : for *President*, Grover Cleveland, 219 ; James G. Blaine, 182 ; for *Vice-President*, Thomas A. Hendricks, 219 ; John A. Logan, 182.—The votes, as counted Feb. 13, 1889, were : for *President*, Benjamin Harrison, 233 ; Grover Cleveland, 168 ; for *Vice-President*, Levi P. Morton, 233 ; Allen G. Thurman, 168 ; as counted in 1893, for *President*, Grover Cleveland, 277 ; Benjamin Harrison, 145 ; J. B. Weaver, 22 ; for *Vice-President*, A. E. Stevenson, 277 ; W. Reid, 145 ; J. G. Field, 22 ; as counted Feb. 10, 1897, for *President*, William McKinley, 271 ; William J. Bryan, 176 ; for *Vice-President*, Garret A. Hobart, 271 ; Arthur Sewall, 149 ; Thomas E. Watson, 27.

ELECTORS, in the German empire, were those great princes who had the right of electing the emperor or king. In the earliest times under the Carolingians, the crown was hereditary ; afterwards, Germany became formally an elective monarchy, but the election was practically almost limited to the reigning family. Under the emperor Charles IV., the right of election became limited to the holders of the highest ecclesiastical and civil offices, some of which gradually became hereditary, and connected with territorial principalities, as in the case of the Hohenstaufens and of the dukes of Bavaria, Saxony, Suabia, etc. Thus there arose seven E., those of Mayence, Treves, and Cologne (as being the chief primates and chancellors of the empire), the E. of the Palatinate and of Bavaria long exercising the right by turns, and the E. of Brandenburg, Saxony, and Bohemia. From 1400 to 1708, the right was never exercised on the part of Bohemia, but otherwise no change took place from the middle of the 14th c. to the peace of Westphalia. By the peace of Westphalia, an eighth electorate was established, Bavaria and the palatinate being each allowed the full right ; and in 1692, a ninth was added, that of Brunswick-Lüneburg, but not without resistance by the E. and states of the empire, so that the new electorate was not fully recognized till 1710. In 1777, the number was again reduced to eight, the elector palatine inheriting Bavaria. The E. held a high and very peculiar position in the German empire. The Golden Bull describes them as "the seven pillars and lamps of the holy empire." They had certain important rights and privileges. They were leagued from the year 1398 for the maintenance of their freedom of election against the pope.

ELEC'TRA. See AGAMEMNON ; ORESTES.

ELECTRICAL EXECUTION. See CAPITAL PUNISHMENT.

ELECTRIC BELLS. The arrangement required to ring a bell or system of bells by electricity is simple. Some form of galvanic battery requiring little attention is placed in any convenient corner, and from it an insulated wire, with the necessary branches, is conducted to the various rooms, thence to perhaps as many bells, and, finally, back to the battery to complete the circuit. Each single bell is provided with a clapper, to which is fixed a piece of soft iron. Near this is fastened an electro-magnet, wound with a quantity of insulated wire, to which the main wire is connected, so that upon the passage of the signal current the magnet attracts the piece of iron fastened to the clapper, and the clapper strikes the bell. In this way any number of bells may be rung at once by sending a powerful current through the wire to which they are all connected. Such arrangements of bells are used very extensively for giving signals simultaneously in a number of rooms or buildings—for example, for striking the hours in all of the rooms of a school building ; for sounding alarms of fire throughout hotels or large buildings, etc.

Bells for continuous vibratory ringing, such as are used for summoning servants, etc., are of the same construction as those previously described, excepting that they are provided with a device for continuously vibrating the current while the bell is being rung. The wire, instead of being connected directly to the coil around the magnet, is connected to a post, against which the clapper rests after striking the bell. The coil is connected to the clapper, and the current passes through the post, and the clapper to the coil. When a signal on the wire causes the magnet to attract the clapper and strike the bell, the connection is immediately severed by the clapper leaving the post, and no more current can pass until the clapper has returned after striking the bell. Instantly when this occurs the connection is re-established, the clapper retracted, and the bell again struck. Thus a continuous ringing is produced as long as the person presses the calling button. This button, or "push button," now found in all well-appointed houses, is simply an ornamental cap covering the terminals of the wires leading to the bells. A slight pressure of the hand upon the button in the center forces the spring-shaped terminals of the wires into contact with each other, and allows the current to pass from the battery to the bell.

ELECTRIC BURGLAR ALARM. The use of wires and electric bells for giving alarms has been very successful. The simplest and most common arrangement consists in an electric bell with wires leading to all of the windows, doors, and other parts of the building to be guarded. The terminals of these wires are set in the framing of the windows and doors, so that if either is opened the action presses the springs together, and rings the bell in precisely the same way as in pressing the ordinary push button. See ELECTRIC BELLS.

All special kinds of the alarms for house protection consist of modifications in the method of making the contact, suitable for special purposes, such as laying sheets of tin under the carpet to make contact with the wires when the carpet is stepped upon. Means are also now generally introduced for indicating which window the signal comes from. This is done by leading the wires from each window separately through an annunciator, which shows through which wire, and consequently from which window the signal came. The entire wiring of houses is also frequently connected with the police office by wire, so that they are notified of any tampering with the house in the absence of its occupant. An ingenious method of protecting safes of great value by surrounding them with a wire net is also in extensive commercial use. The safe is completely enclosed in a wooden cabinet, the sides and doors of which are lined with a complicated network of fine wires. When the doors of the cabinet surrounding the safe are closed, the wires in the doors are connected with the rest of the wires by springs, and a continuous circuit is formed all around the safe, through which a delicate current is passed by the central office watchmen until the hour for reopening the safe. The complication of the wires is such that it would be impossible to disconnect any of them, or even substitute other wires without disturbing the delicate current which is kept on them. For further safety there is sometimes introduced a machine, which automatically changes the combination of wires during the night, at times known only to the watchmen.

ELECTRIC CLOCKS AND ELECTRIC TIME SYSTEM. Electricity is used in connection with clocks in several ways. It is used in place of a spring for actuating the clock; for moving the hands of a number of dummy clocks, in accordance with the motions of the hands of a standard clock; for sending the pendulum beats of a standard clock over wires to observatories, the shops of clock-makers, etc., and for periodically winding up the springs of ordinary clocks. For the first class—that of furnishing the motive power of clocks—the use is based upon the idea of securing greater uniformity of running by keeping the pendulum in motion by electricity instead of by spring or weight. For this purpose a great many special devices have been made, none of which are of particular importance. The use of electricity for keeping a number of clocks in agreement with a standard clock is of more importance. The pendulum of the standard clock is arranged to make an electric contact at each swing. By touching a spring, or better, by dipping its lower extremity into a trough of mercury at the lowest point of the swing, the pendulum and the trough being made the terminal of an electric circuit, an impulse is sent over the wire at every vibration of the standard pendulum. Upon this wire, in all desired buildings, are placed receiving clocks, consisting of a dial with hands fastened to toothed wheels. A magnet connected to the wire moves the wheel of the second hand one tooth as each impulse comes over the wire, thus keeping the second hand, and consequently the connected minute and hour hands, in positions corresponding exactly to those of the hands of the standard clock. This is the foundation of a considerable business known as time telegraphing. The use of the telegraph for simply transmitting taps representing the pendulum beats of a standard clock, for the use of observatories, is the most important division of the subject. The standard clock is arranged to close the circuit at each vibration, as previously described. The signals so produced are carried to clock-makers, observatories, etc., on suitable wires. In New York city, where this system is extensively used, and where several distributing circuits are required, the impulses of the standard clock are used to operate a multiplying instrument, which reproduces them at the same moment on a number of different wires.

The time-ball dropped at noon in New York city by the Western Union telegraph co. is an application of this system. At a few minutes before twelve, the standard clock in the Naval observatory at Washington is connected with one of the wires running to New York. At the same time the ball is hoisted to the top of the flag-staff in New York, and the hoisting rope is secured by a catch controlled by an electro-magnet. This magnet is connected to the wire to Washington. At the beat of twelve o'clock the pendulum itself of the clock at Washington sends the impulse which loosens the catch, and the ball on the flag-staff at New York falls. To guard against error due to slow descent caused by high winds, etc., the ball is arranged to strike a lever when it reaches the bottom, and send another signal back to Washington. This shows the Washington observer whether the ball was behind time in falling. If it is found to be late, it is immediately hoisted again as a signal of error.

The fourth class—namely, of clocks in which electricity is used to wind up the main spring periodically, is not of much importance. The object is to save the trouble of winding up, and secure a little greater uniformity of action. The spindle, ordinarily turned by the winding key, is provided with a small electric-motor actuated by a battery placed in any convenient closet. At uniform intervals the motor winds up the clock.

ELECTRIC FUSE is an apparatus for firing explosives in mines by means of the heating effect of electricity in a wire. The faculty of electricity of traveling quietly through a wire of large size and developing suddenly into intense heat when it meets a small wire, affords an excellent means of setting fire to explosive charges from a safe distance and at will. The use of electric fuses has therefore developed very rapidly, and they are now employed exclusively for firing all large submarine mines and torpedoes and for the majority of ordinary blasts. The fuse consists of a suitable small box, A, con-

taining a piece of wire, fig. 1, sufficiently fine to be made red hot by the current which is to be used. This wire is soldered to supports on the inside of the box, which are led through its walls from rigid connectors on the outside, to which the main cables, C, are attached. The object of arranging the fine wire in this manner is that the strain of the heavy connecting cables may be spent on the box and not on the fine wire within; the wire, being extremely thin, would be broken by even a very slight pull. The box is then filled with fine-grained powder, B, and the lid tied down. The wires of the fuse are then carefully joined to the long conducting wires which lead to the battery. They should be of copper and as thick as is convenient, so as to offer very little resistance; No. 16 gauge copper wire is a suitable size. The fuse is then introduced into the charge to be fired: if it is for a submarine explosion the powder is contained in a canister, the neck of which, after the introduction of the fuse, is carefully fastened by means of cement. When contact is made with the battery, which is effected through the intervention of a suitable key, the current traversing the platinum wire renders it incandescent, which fires the fuse, and thus the ignition is communicated to the charge in which it is placed.

The heating effect depends more on the size than on the number of the plates of a battery, for the resistance in the connecting wires is small. An iron wire may be melted by a single Wollaston's element (see GALVANIC BATTERY), the zinc of which is 8 in. by 6. Hare's battery has received its name, deflagrator, on account of its greater heating effect, produced by the large surface of its plates. Batteries for this purpose are now made up in boxes suitable for carrying, fig. 2, and provided with a key for starting the current which is to fire the mine.

When any circuit is closed, a definite amount of heat is produced throughout the entire circuit; and the amount of heat produced in any particular part of the circuit is greater the greater the proportion which the resistance of this part bears to the entire circuit. Hence, in firing mines, the wire to be heated should be of as small section and of as small conductivity as practicable.

These conditions are well satisfied by platinum, which has over iron the advantage of being less brittle, and of not being liable to rust. Platinum too has a low specific heat, and is thus raised to a higher temperature by the same amount of heat than a wire of greater specific heat.

On the other hand, the conducting wires should present as small a resistance as possible, a condition satisfied by a stout copper wire; and again, as the heating effect of any circuit is proportional to the square of the strength, and as this is directly as the electro-motive force and inversely as the resistance, a battery with a high electro-motive force and small resistance, such as Grove's or Bunsen's, should be selected.

ELECTRIC FISHES. See ELECTRICITY, ANIMAL.

ELECTRIC GAS LIGHTING. Electricity is very extensively used for lighting gas. In cases where the fixtures are out of reach, as in public halls etc., the wire is carried around the gas fixtures, being interrupted by a small break or space over each burner, so as to cause sparks at these points when a current is passed. For these lighters an electrical machine is provided which will generate sufficient electricity when its crank is turned to travel through the wire and jump over all the breaks. The sparks produced at the breaks are sufficient to set fire to the gas, which of course has been previously turned on, and all the burners are lighted at once. Another system which can be used only when each burner is within reach is employed where it may be desired to light each burner separately. It consists of a number of wires permanently connected to a galvanic battery and induction coil, each wire being led separately to one of the burners, and provided with a trigger for bringing the wires in contact, and so producing a spark when any particular burner is to be lighted. In this arrangement the closing of either one of the circuits at its burner produces a considerable spark by the inductive action of the induction coil, and ignites the gas.

ELECTRIC HEATING. Heat is developed by the passage of a current through any conductor, and the greater the resistance of the conductor the higher will be the temperature to which it is raised by the passage of the current. This is the principle upon

FIG. 1.

FIG. 2.

which all electric heaters are constructed. These heaters have come into considerable use since 1895 for both heating apartments, street cars, etc., and for cooking. Their general construction is as follows: Wire of high resistance is embedded in asbestos, fire clay, or other refractory material and built up into plates of large radiating surface, these being generally enclosed between iron plates. The current is passed through the resistance wire which at once becomes very hot and in turn heats up the refractory material and the enclosing iron. When the heater has been brought up to the required temperature the current may be turned all or partly off, and owing to the nature of the materials used the heater will retain its heat for a long time.

ELECTRICITY. The name given to the unknown matter or force, or both, which produces electric phenomena. Electricity, however produced, is believed to be one and the same thing, although static, voltaic or galvanic, magneto, thermo, and animal electricity are used as convenient terms to signify the origin of the electricity. They are no longer considered as different kinds of electric force. There have been numerous hypotheses as to the nature of electricity, the three most important of which are known as the single fluid theory, the double fluid theory, and Hertz's theory of electro-magnetic radiations, the latter theory being at the present time most generally accepted. The single fluid theory assumes that electricity is due to the presence of a single, tenuous, imponderable fluid, whose particles mutually repel each other but which are attracted by all matter and that every substance possesses a definite capacity for holding this electric fluid. When this capacity is just satisfied, no electrical phenomena are manifest; when less than this quantity is present the body becomes negatively excited, and when more, positively excited. Another view considers electricity to be due to differences of ether pressure, electricity being the ether itself and the pressure or electromotive force being the differences of ether pressure. The double fluid theory assumes the presence of two imponderable fluids, one negative and the other positive. The particles of positive fluid are assumed to repel one another, as do also the particles of negative fluid, but particles of opposite polarities attract each other. The two fluids are strongly attracted by matter, and when both are present in matter to an equal extent no electrical phenomena are present, as the two fluids neutralize each other, but when two bodies are rubbed together the fluids separate, one remaining in one body and the other passing to the other body. Hertz's theory assumes electricity to be due to vibrations of the ether, and his remarkable researches have shown that when an impulsive discharge is passing through a conductor, ether waves are propagated and radiated in all directions in the space surrounding the conductor. These waves are similar in all respects to those of light except that they are much longer. These electro-magnetic waves possess the same velocity and the same characteristics as light vibrations. When impulses of electricity pass from one end of a long conductor to the other, the pulses are supposed to travel through the universal ether surrounding the conductor rather than through the conductor itself. In the free ether the velocity is the same as that of light, but in the intermolecular ether of conductors the velocity depends upon the nature of the medium.

Friction between two substances always produces electrical separation. In general when two bodies are thus electrified that one becomes negative whose particles are more easily removed by friction. Differences of temperature also affect the electrical condition of bodies, a warm body being usually negative when rubbed on a cold piece of the same substance. It has been found that the degree of electrification produced by rubbing two substances together is independent of the pressure and the amount of surface in contact but depends on the materials and the velocity with which they are rubbed against one another. The amount of the charge is not proportional to the actual mechanical friction, so it is doubtful if the friction is the real cause of electrification.

Incidentally, the minute quantities of electricity produced in this way have enormously high pressure enabling them to form sparks of considerable length; and the identity of different kinds of electricity was not known till the time of Franklin, when it was proved that the sole difference was one of quantity and pressure. See **ELECTRICITY, STATIC.** Electricity of the continuously flowing form was first derived from galvanic batteries (q. v.), and its properties and applications as far as developed with these sources, were known and treated under the title of Galvanism. The production of electricity from chemicals, however, was too expensive to permit of its being extensively used in industrial processes. The invention of dynamo-generators, first known as magneto-generators (q. v.), during the last twenty years, has reduced the cost of electricity to one hundredth of its cost from chemical batteries, and it is now used extensively in many arts. The wide usefulness of electricity results from the peculiarity of its powers or properties, and its possession of them in a very high degree. It travels with incredible velocity. This has rendered the telegraph possible. It attracts objects at a distance, hence its value for moving the clappers of bells, running motors, etc. It decomposes chemicals, giving us electrolysis, electro-plating, electro-chemistry, electro-metallurgy, etc., and the analysis of compounds previously unknown. It is readily convertible into heat in a wire, giving us the electric light. It is attractive to the engineer as a force because its laws of action are very accurate and well understood. Any results of electrical action can therefore be predetermined with a degree of certainty exceeding that found in any other branch of engineering.

$$\text{Current} = \frac{\text{Pressure}}{\text{Resistance}}, \text{ or Ampères} = \frac{\text{volts}}{\text{ohms.}}$$

This is Ohm's law. By transposing the terms of the equation, we may get an expression for either of the three elements—current, pressure, or resistance, in terms of the other two. This relation holds true, and is completely accurate, in every possible case and condition of practical work. This remarkable precision and definiteness of action renders possible the creation of an extensive art of electrical testing, by which we are enabled not only to make accurate measurement of electrical apparatus, but to make determinations in other subjects through the agency of electricity. For example, when an ocean cable is injured or interrupted, the precise location of the trouble is ascertained by measuring the electrical resistance of the parts of the cable on each side of the break, or by observing the quantity of electricity which the parts of the cable will hold, etc. See Kempe's *Electrical Testing*.

Electricity and the capacities of electrical apparatus are measured and the magnitudes of the measurements expressed in the following convenient electrical units.

- Ampère = unit of current. The amount of current at unit pressure that would flow through a circuit of unit resistance per second, or such a current as will deposit .00111815 gramme of silver per second.
- Volt = unit of electric pressure. The pressure that would cause a current of one ampère to pass through a circuit of unit resistance. The value of the electromotive force of a current is called its voltage.
- Ohm = unit of electrical resistance. The ohm is a resistance equal to that of a column of mercury of 106 centimeters in length, and one square millimeter of cross section, at 0° C. temperature.
- Coulomb = unit of quantity. The quantity of electricity that flows per second past a cross section of a conductor conveying one ampère.
- Farad = unit of electrical capacity. The capacity of a conductor that would enable it to hold one coulomb under a pressure of one volt.
- Joule = unit of electric work. The work required to raise a coulomb one volt in pressure, or .73732 foot-pound.
- Watt = unit of electric power, = 1 joule per second $\frac{1}{748}$ horse-power. Watts = ampères \times volts.

The conversion of electrical energy into energy of other kinds for practical use, is accomplished by taking advantage of the peculiar properties of electricity in the different ways in which it can be done with especial advantage. It should be remembered that electricity is only utilized as a means of transmitting energy from one point to another, and is not a form of energy itself. It may be compared to the belt between a steam engine and a machine, which serves to transmit the power of the engine over to the machine when the power is utilized. In the same way the electric current transmits the power of an engine or any other prime mover over any distance through conductors, at the other end of which the power is utilized in the form of heat, light or mechanical energy. The relation between electricity and heat is very close, hence, the transition from electricity to heat is extremely simple. Upon this fact and principle the processes which depend upon the conversion of electricity into heat are founded. The chief example is the electric light (q. v.), which is produced by converting an electric current into intense heat by means of the resistance of the conductor at the desired point. The relation of light to heat and electricity is also known to be very close, the difference being simply a matter of different rates of vibration. The class of uses of electricity for producing mechanical power depends upon its faculty of attraction, which is now explained by the following theory: A wire through which a current of electricity is passing is found to be surrounded always with a circular region of attractive force. The attraction is found to exist in the form of rings around the wire; and lines so drawn to represent the position of these imaginary attractable objects, are called "lines of force" (see COMPOSITION OF FORCES). These imaginary lines, or the direction in which a current-carrying wire attracts, are invariably found to be at right angles to the wire. A magnet or magnetic needle placed near the wire will swing around and place itself at right angles to the wire and parallel to these lines. This shows that the direction in which magnetism acts is at right angles to the direction in which electricity acts—that is, the electric current creates, at right angles to itself, an artificial magnetism. The lines of force around a wire are found to be magnetic lines, and to have strong power of attraction, as if they were magnets laid crossways to the wire. A conclusion from this is that if we wind a quantity of wire on a cylinder of soft iron, since the axis of the cylinder will be at right angles to all of the wire, we shall find that the cylinder becomes strongly magnetic, and this effect increases in proportion to the number of turns of wire about the cylinder and the current which is passed through it. This is the electro-magnet, which, together with the solenoid (q. v.), is the foundation of most electrical apparatus, such as regulators, telegraph instruments, motors, etc. It is seen from this that the relation between electricity and magnetism is very close. According to Ampère's theory, magnetism consists in the circulation around a bar of iron of minute electric currents which throw out lines of force, and produce the attraction as above described, which in this case we happen to call magnetism.

The breaking up of chemical unions by electrical action, giving rise to the arts of electro-plating, electro-chemistry, etc., remains to be considered. The subject has not as yet been extensively investigated. The effects probably depend upon the disturbing effect which the molecular or atomic motions known as electricity produce upon the chemical unions. The vibrations of heat are a common means of producing

chemical change or separation; and the vibrations of electricity probably act in the same way. The production of electricity by the action of chemical batteries also depends upon the conversion of the energy of chemical affinity into the energy of electrical vibrations in some way similar to its easy conversion into heat. It is known also that the amount of electricity produced will in every case be proportional to the affinity of the chemicals about to combine. See titles under ELECTRIC, ELECTRO; also MAGNETO ELECTRIC MACHINES, TELEGRAPH, etc. See Gordon's *Electricity and Magnetism* (London); Sprague's *Electricity: its Theories, Sources, and Applications* (London); Fleeming Jenkin's *Electricity and Magnetism* (New York); Ganot's *Physics*; Sylvanus Thompson's *Dynamo-Electric Machines* (London); Kempe's *Electrical Testing* (London); *The Electric Motor and its Applications*, by Martin and Wetzlar; Caillard, *Electricity* (1891); Brackett, *Electricity in Daily Life* (1891).

ELECTRICITY, ANIMAL. In this article we shall notice (1) the electricity developed by the so-called electrical fishes; (2), the electric properties of muscle and nerve; and (3) the electric phenomena of membranes and glands.

1. Although the peculiar powers of the torpedo and of the gymnotus were well known to the ancients, the first scientific discovery in this department of electricity was the determination of the electrical character of the shock of the torpedo by Walsh in 1772 ("Of the Electric Properties of the Torpedo," *Philadelphia Transactions*, 1773). From that date to the present time, the electric organs of certain fishes, which will be immediately mentioned, have been made the object of special study by some of our greatest anatomists and physiologists, among whom may be named John Hunter, Galvani, Rudolphi, Knox, Valentin, Pacini, Matteucci, Goodsir, and Jobert de Lamballe, who has published a special work, entitled *Des Appareils Electriques des Poissons Electriques* (Paris, 1858), accompanied by a magnificent volume of plates.

The species of electrical fish which has been the longest known, is the *raia torpedo*, or electric ray, which has much the appearance of a skate. It is common in the bay of Biscay and in the Mediterranean, but is seldom met with on the shores of Britain. It grows to a considerable size, and is often above 80 lbs. in weight. It is now usually regarded as not a true ray, but as constituting a distinct genus, to which the terms *torpedo* and *narcine* have been applied by different naturalists—the latter name being derived from the Greek word *narke*, which was given to it by Aristotle. The electric organs or batteries are placed on each side, in the spaces between the pectoral fins, the head and gills. See TORPEDO. Each battery consists of a number (varying according to the age of the animal) of hexagonal prisms, which extend perpendicularly between the dorsal and abdominal surfaces, and present somewhat of a resemblance in shape and arrangement to the cells of a honey-comb. Four nerves, which are branches of the fifth and eighth cerebral pairs, go to each battery; and the nervous center of the electrical apparatus is, therefore, the *medulla oblongata*. Several species of *narcine* are known, all of which possess the electric property.

The ordinary rays and skates possess an organ in the tail which closely resembles the electric organ of other fishes, but its function is still doubtful; and in opposition to the view of its electric nature, it may be mentioned that while Dr. Starke (to whom the discovery of this organ is due) found it in the tail of every species of true ray, both professor Goodsir and M. Robin ascertained it to be wanting in the tail of the *torpedo*.

The *gymnotus electricus*, or electrical eel, is little inferior in celebrity to the *torpedo*. It is common in all the streams which flow into the Orinoco, and is generally procured from Surinam. It is usually 3 or 4 ft. in length, but may reach a length of 6 feet. The whole of its viscera lie close to the head, and the anal aperture is only 2 in. behind the mouth; all the rest of the body inferiorly is occupied by the electrical apparatus, which consists of four batteries—viz., two on either side, and one above the other—the uppermost or dorsal being the larger. These batteries consist of a number of piles placed horizontally in a direction from head to tail; and from this circumstance, as well as from their peculiar structure, they were compared by Redi to galvanic troughs. The number of these piles in the greater battery, is from 30 to 60; in the lesser, from 8 to 14. These batteries are supplied by about 224 pair of nerves on each side, derived from the inferior or motor roots of the spinal nerves.

Humboldt, both in his *Personal Narrative* and in his *Views of Nature*, gives a graphic account of the mode in which the Indians catch wild horses through the agency of the gymnotus. Faraday made numerous observations on a specimen 40 in. in length, which was exhibited in the Adelaide gallery some years ago. He calculated that, at each medium discharge, the animal emitted as great a force as the highest charge of a Leyden battery of 15 jars, exposing 3,500 sq.in. of coated surface. The strongest shocks were obtained by touching the fish simultaneously near the head and near the tail; scarcely any shock being felt if the hands be placed one on each side of the fish, at the same distance from either extremity; the amount of the shock, as might have been expected, varying with the length of the column which produces it. The shocks have sufficient power to stun, or even to kill fish; and the same discharge produces a more powerful effect upon a large fish than it does upon a small one, since the larger animal exposes a larger conducting surface to the water, through which the electricity is passing, and, consequently, it receives a more violent shock. On one occasion, when a live fish was put into the tub, which was 46 in. in diameter, the animal was seen to coil itself into a

semicircle, the fish lying across the diameter ; this was the most favorable position for giving the strongest shock ; an instant afterwards, the fish floated dead upon its side, and was then devoured by the *gymnotus* (q.v.).

The shock of both the *torpedo* and the *gymnotus* gives rise to momentary currents of sufficient intensity to deflect the galvanometer, to magnetize a needle, and to decompose iodide of potassium ; and from both fish sparks have been obtained.

We next come to the electrical fishes of the genus *malapterurus*. The only fish of this genus whose electrical organs have been examined and described is the *M. electricus* of the Nile, called raash or thunder-fish by the Arabs. It has barbules dependent from the region of the mouth, like the common barbel ; and its smooth skin is diversified with irregularly shaped spots. Its length is from 8 to 14 inches. The batteries are two in number, "separated," to adopt Prof. Goodsir's description, "but at the same time intimately connected to one another in the mesal plane along the dorsal and ventral margins of the body, so as to form a continuous layer of a gelatinous consistence closely adherent to the skin, and enclosing as in a sac the entire animal, except the head and fins." The structure of these batteries is very complicated, and we shall not attempt to explain it.

In the year 1854, a new electrical fish became known to us, belonging to the same genus as the one just described. It is found in the muddy brackish water of the river Old Calabar, which empties itself into the bight of Benin. The fish has accordingly been named the *malapterurus Beninensis* by Mr. Andrew Murray, who has described and figured it in the *Edinburgh Philosophical Journal* for July, 1855. It is much smaller than the Nilotic species, and the formulæ of the number of fin-rays differ in the two species. We believe that this new species was dissected by the late Prof. Goodsir, but we are not aware that the results were ever published. See MALAPTERURUS.

Our limits will not allow of our noticing the successive opinions which have been entertained regarding the action of the electric organs in fishes. There does not seem to be room for doubt that the electrical organs of fishes have been developed from muscular tissue. In order to generate an electric current it is only necessary to establish a difference of electrical pressure, and we know that muscular contraction does produce such a pressure. A gymnotus in the possession of M. d'Arsonval, of Paris, was able to give a discharge of about 2 ampères at over 100 volts pressure. The electrical organ was situated underneath the animal, the positive pole being at its head and the negative at its tail. In giving violent shocks the animal rolls itself into a circle, and completes the circuit from its head to its tail through the object attacked. The discharge is at the will of the animal, which may be touched, if not irritated, without causing a discharge.

2. The study of the electrical properties of muscle and nerve dates from the period (1786-94) in which Galvani made his great discoveries. Having first ascertained that contractions were produced by electricity in the muscles of a recently killed frog, he subsequently found that similar contractions occurred when two dissimilar metals in contact with one another were brought in contact with the nerve and muscles respectively of the frog's leg. The experiment may be readily made in the following manner : Expose the crural nerve of a recently killed frog ; touch it with a strap of zinc, and at the same time touch the surface of the thigh with one end of a bit of copper wire. At the moment that the other end of the wire is brought in contact with the zinc, the limb is convulsed ; but the convulsions cease when the two metals are separated from each other, though they are still in contact with the animal tissues ; and they are renewed when the zinc and copper are again made to touch. At first, Galvani believed that the contractions were due to electricity evolved by the metals, but finally he concluded that it is produced by the animal textures themselves. No important step in this direction was afterwards taken till 1827, when Nobili, with his improved galvanometer (q.v.), discovered the electric current of the frog. He found that when the circuit of the nerve and muscles of the leg is closed by the instrument, a deviation of the needle, to the extent sometimes of 30°, occurs, due to a current which passes in the limb from the toes upwards, and which could be increased when several frogs were simultaneously included in the experiment. Undoubted proof was thus afforded that electricity is developed in connection with muscle and nerve.

The researches of Matteucci, confirmed by the subsequent investigations of Dubois Reymond, have demonstrated the existence of what is termed the *muscular current* in living animals. They show that in the living animal an electrical current is perpetually circulating between the internal portion and the external surface of a muscle—a current due probably to the chemical changes which are always occurring in the animal tissues. This muscular current ceases in warm-blooded animals in a very few minutes after their death ; but in cold-blooded animals, as in the frog, it continues for a much longer period. The following is perhaps the best experiment for showing the existence of the muscular current : Five or six frogs are killed by dividing the spinal column just behind the head ; the lower limbs are removed, and the integuments stripped off them ; the thighs are next separated from the legs at the knee-joint, and are cut across transversely. The lower halves of these prepared thighs are then placed upon a varnished board, and so arranged that the knee-joint of one limb shall be in contact with the transverse section of the next, and thus a muscular pile is formed, consisting of ten or twelve elements ; the terminal pieces of this pile are each made to dip into a separate small cavity in the board, in which a little distilled water is placed. If the wires of a sensitive galvanometer be attached to a pair of platinum plates, and these plates be placed simultaneously, one into each cavity in connection with the muscular pile, a deviation of the galvanometer needle will be ob-

served in a direction which indicates the existence of a current passing from the center or cut transverse surface of the muscle towards its exterior.

Dubois Reymond has subsequently shown by the use of extremely sensitive instruments, that even the smallest shreds of muscular tissue exhibit proof of the existence of such a current; and he has established the general law, that any point of the natural or artificial *longitudinal* section of a muscle is positive in relation to any point of the natural or artificial *transverse* section.

3. The electrical relations of membranes and glands have been especially studied by Mr. Baxter, whose "Experimental Inquiry, undertaken with a View of ascertaining whether any or what Signs of Current Electricity are manifested during the Organic Process of Secretion in Living Animals," is published in the *Philosophical Transactions* for 1848 and 1852.

His chief conclusions regarding the electrical condition of the intestinal mucous membrane are:

1. When the electrodes of a galvanometer are brought into communication—one with the mucous membrane of the alimentary canal, and the other with the blood flowing from the same part—a deviation of the needle takes place, indicating that the mucous secretion and the blood are in opposite electrical states.

2. The effect ceases after death, and may be considered as arising from the decomposition of the blood—viz., from the changes which occur during the formation of the secreted product and venous blood.

His conclusions regarding the electrical relations of the secretions and blood of the liver, kidney, and mammary gland, are as follows:

1. During biliary secretion, the bile and the venous blood flowing from the hepatic veins are in opposite electrical states.

2. During urinary secretion, the urine and the venous blood flowing from the renal vein are in opposite electrical states.

3. During mammary secretion, the milk and the venous blood flowing from the mammary veins are in opposite electrical states.

For further information on this subject, the reader is referred to Matteucci's *Lectures on the Physical Phenomena of Living Beings*, translated by Dr. Pereira; to his series of "Electro-Physiological Researches," published in the *Philosophical Transactions*; and to Dubois Reymond's *Untersuchungen über Thier-Electricität*.

ELECTRICITY, DEATH CURRENT OF. This term is exceedingly vague, as the exact amount of current necessary to cause death has not been satisfactorily determined. It also depends upon what path the current takes through the body, and what vital organs lie in this path. It depends both upon the ampères and the voltage of the current. Incandescent light circuits of about 100 volts are not at all dangerous to handle, although there might be a possible danger in making very large contacts with the moist skin, so that a large current was passed through some vital organ of the body. An alternating current of about 1500 volts and 120 alternations per second is used in electrocution. But with a higher voltage and number of alternations the danger seems to decrease. In the experiments of Tesla he has passed currents of 1,000,000 volts and 1,000,000 alternations through his body with perfect safety. See **CAPITAL PUNISHMENT**.

ELECTRICITY, DIRECT CONVERSION OF. The problem of producing electricity directly by the combustion of coal, precisely as heat is obtained, is one of the most promising fields for future investigation. Since, as has been stated, electricity is now considered to be a form of vibration similar to that of heat, there seems to be no absolute obstacle in the way of burning coal directly into electricity.

At present we are dependent upon the steam-engine to drive the mechanical generator of electricity, and there is at once a loss in this first step of 90 per cent. of the energy of the coal, while the dynamo-electric generator loses only about 10 per cent. of the power brought to it by the belt from the steam-engine. The solution of this problem will greatly cheapen electricity. It would entirely revolutionize the arts, and the furnace and electric motor would probably displace the steam-engine and boiler.

ELECTRICITY, MEDICAL. Electricity, in its application to medicine and surgery, is employed in the following forms: 1. *Electrization*, by electricity of high tension, as obtained by friction of glass in the common electrical machine; 2. *Galvanization*, by current electricity of quantity, as set in motion by the voltaic battery; and 3. *Faradization*, by induced or interrupted currents, produced by magneto-electric or electro-magnetic induction coil machines.

Electrization.—Frictional electricity is now seldom employed in therapeutics, on account of the inconvenience experienced in the management and insulation of the glass or common electrical machines; yet the powerful stimulant and counter-irritative effect of sparks drawn from the affected parts is still recommended in paralytic affections, in chorea and other nervous diseases; and the succussion produced by shocks from the Leyden jar is undoubtedly the most effectual remedy in amenorrhœa.

Galvanization.—The effect of passing a voltaic current from a battery of many elements through the living body, is to cause a shock or contraction of the muscular tissues, succeeded with a distinct interval by a momentary sensation or flow of heat due to the electric and nervous (?) polarization of the circuit. During the continued passage of the current, slight tingling sensations and elevation of temperature are observed, especially in those parts in contact with the electrodes or poles, which become painful and congested, and finally inflamed and ulcerated. On opening the circuit, the depolarization of

the tissues which ensues is accompanied by a second shock and subsequent glow of heat, which are powerful in proportion to the length of time the circuit has remained closed. The amount of contraction in the muscle has relation to the *intensity* rather than the *quantity* of electricity passed through it—that is, to the rapidity with which the electric state is changed, rather than the amount of that change. The calorific effect of the current is proportionate to its *quantity*. Thus, a single pair of plates of platinum and zinc, an inch square (charged with chromic acid), will, under ordinary circumstances, exercise little or no physiological effect; but if the same pair be divided so as to form a compound battery of twelve smaller pairs, its application will be attended with the shocks and calorific effects described. A further division into 24 or more pairs increases the shock, but the sensation of heat becomes less marked. With certain limitations, therefore, the shock of the battery depends on the number of its elements, without regard to their size, its calorific effect to the area of its plates. The nerves of the organs of special sense, when subjected to galvanization, evidence phenomena peculiar to their proper function. Thus, the passage of the current through the retina is attended by the sensation of a flash of light, which is bluish when the positive pole is applied to the eye, and tinged with the complementary orange when the force is transmitted in the opposite direction. A faint sensation of light is also perceived when the skin of the face or mucous membrane of the mouth is galvanized, caused by reflex action from the sentient filaments of the fifth pair of nerves which are distributed to those parts. Galvanization of the ear gives rise to bubbling, ringing, or cracking sounds, and occasionally to distinctly musical tones; that of the tongue, to an acid taste under the positive pole, and an alkaline taste under the opposite one; that of the lining membrane of the nose, to sneezing and a peculiar smell, which differs with the direction of the current. The continuous gentle action of small single and compound voltaic arrangements has been more or less successfully employed in paralysis, amaurosis, and neuralgia, either by application to the surface of the body, or carried directly to the affected parts by needles thrust into them (galvano-puncture). More powerful batteries, consisting of six or eight cells of the carbon battery of Bunsen, the nitric acid battery of Grove, or the platinized zinc battery of Strethill Wright, have been used to coagulate the fibrinous contents of aneurismal sacs—to decompose calculi in the bladder (?)—and to render platinum plates or wires incandescent, for the surgical cauterization of internal parts not otherwise easily accessible.

Faradization.—The instruments employed for the exhibition of interrupted or induced currents are the magneto-electric and the electro-magnetic coil machines. In the first, the electricity is set in motion in a long thin wire coiled round a bar of iron or keeper maintained in constant whirling motion before the poles of a permanent horseshoe magnet, the magnet with every half revolution magnetizing the keeper alternately in opposite directions, while the constantly recurring magnetism of the keeper in its turn induces impulses of alternating currents in the coil-wire. The disadvantages of the magneto-electric machine, therefore, are, that it is not self-acting, and that its currents pass alternately in opposite directions. In the electro-magnetic machine, the thick coil-wire, wound over a core of iron, is made to conduct the current from a single voltaic pair which magnetizes the iron. When the battery-current is interrupted, the iron core becomes instantly demagnetized, and this change in its magnetic condition is attended with a rearrangement of the polarity of the coil-wire, and the passage through it of an impulse of induced electricity. By a simple arrangement, the magnetized iron is made to interrupt and renew the battery-current; and the machine, thus rendered self-acting, furnishes a rapid succession of momentary currents passing in the same direction, and of much greater quantity than those of the magneto-electric machine. Currents higher in tension, less in quantity, and more resembling frictional electricity, may be obtained from an additional coil ("secondary coil") of very thin and long wire wound over the former one, but they are not of much importance in medical practice. The accompanying figure represents the latest form in

which this useful apparatus for administering electricity for medical purposes is constructed for physicians' use.

The induction coil described above is placed in a suitable case, of a shape convenient for carrying, and in addition, a battery of two Smee's cells, permanently connected to the coil. This furnishes the power for operating the coil.

The physiological action of the coil-machines is equivalent to that of rapidly repeated discharges from a large Leyden jar weakly charged; and as the time engaged by the passage of each impulse in the succession of discharges is too short to permit the development of any decided polarization of the tissues, the distinct calorific effects which accompany the commencement and cessation of the *galvanic* discharge do not occur.

Faradization is applicable to a great variety of chronic diseases in which a deficiency of functional energy exists; in paralytic affections unconnected with active disease of the nervous centres, mercurial and lead palsy, and in that produced by rheumatic affection and exposure to cold; in nervous or hysterical aphonia, or loss of voice; in amaurosis (q.v.), when not connected with inflammatory or organic disease; in nyctalopia, or night-blindness; in amenorrhœa, when uncomplicated with active disease of the uterus; in suppression of the lacteal secretion; in constipation (q.v.) from deficiency in the peristaltic action of the intestines; in paralysis of the bladder (?), and with very doubtful effect in the induction of uterine contraction; in suspended animation from drowning, narcotic poisons, etc. In spasmodic and neuralgic diseases the benefit of faradization is less to be depended on; but a very gentle and long-continued application of it has afforded relief in the distressing starting of the lower limbs which occurs in paraplegia or paralysis of the lower half of the body; in "writers' cramp" and spasmodic forms of hysteria; in tic douloureux, sciatica, and hysterical neuralgia. Faradization by electro-puncture has been successfully employed to induce the union of non-united fractures, the currents being passed between the disjoined ends of the bones; and to excite absorption in bronchocele and hydrocele, though with more doubtful effect. The intense sparks from the "secondary coil" have been used in place of those obtained by frictional electricity; and lastly, it has been proposed to employ the brilliant streams from powerful induction coils confined in fine "vacuum tubes" of glass, to illuminate internal parts of the body for the performance of surgical operations, etc.

The possibility of introducing certain medicines into the system by electricity is shown by the following experiment made in France in 1886. The negative pole of a battery was applied over a rubber plate moistened with a solution of iodide of potassium and placed upon the surface of the body. When the positive pole was placed on the part to be affected, the iodide left the potassium and passed rapidly through the tissues to the positive pole.

ELECTRICITY, EVAPORATION PRODUCED BY. In July, 1891, Prof. William Crookes made public certain discoveries regarding a principle which he calls Electrical Evaporation. The first of these discoveries is represented by the scientific toy called the Radiometer, a small mill enclosed in a vacuum. The metallic vanes of this mill are set in motion by solar rays, mechanical motion being here the outcome of radiant energy. A powerful stream of electricity is then passed through two platinum wires into the vacuum. It is well known that with any vacuum a discharge of electricity takes place between the platinum wires; but by carrying the exhaustion to an extent previously unattempted a new phenomenon appears. Reduced to a small fraction of their previous number, molecules fly from the electrified points through considerable distances before they produce light. A dark space in the exhausted vessel now appears, which is occupied by matter in rapid motion. Matter in this condition represents a fourth condition of matter, as distinct from gas as gas from liquid or liquid from solid. It is found that the stream of molecules can be deflected into a curved line by a magnet, and that small mills inside the vessel can be set in motion by the application of a magnet to the outside of the glass. Now, during the discharge in vacuo it is known that on the inside of the glass near the platinum wires, and especially near the negative pole, a deposit of metallic platinum is formed. It is clear that the electrical energy produces a volatilization of the metal. This is properly described as *electrical evaporation*.

ELECTRICITY, STATIC. Thales, about 600 B.C., refers in his writings to the fact that amber, when rubbed, attracts light and dry bodies. This was the only electric fact known to the ancients. The science of electricity dates properly from 1600 A.D., when Gilbert of Colchester published a book, entitled *De Arte Magnetica*, in which he gives a list of substances which he found to possess the same property as amber, and speculates on magnetic and electric forces. He is the inventor of the word, which he derived from the Greek word *electron*, amber. Otto von Guericke, burgo-master of Magdeburg, in his work *Experimenta Nova Magdeburgica* (1672), describes, among his other inventions, the first electric machine ever made, which consisted of a globe of sulphur turned by a handle, and rubbed by a cloth pressed against it by the hand. Hawksbee (1709) constructed a machine in which a glass cylinder, rubbed by the dry hand, replaced Guericke's globe. Grey and Wehler (1729) were the first to transmit electricity from one point to another, and to distinguish bodies into conductors and non-conductors. Dufay (1733-45) showed the identity of electrics and non-conductors, and of non-electrics and conductors, and was the first to discover the two kinds of electricity and the fundamental principle which regulates their action. Between 1733 and 1744, much attention was given in Germany to the construction of electric machines. Up to this time, notwithstanding the inventions

of Guericke and Hawksbee, the glass tube rubbed by a piece of cloth, which Gilbert first introduced, was used in all experiments. Boze, a professor at Wittenberg, taking the hint from Hawksbee's machine, employed a globe of glass for his machine, and furnished it with a prime conductor. Winkler, a professor at Leipsic, was the first to use a fixed cushion in the machine. The Leyden jar was (1746) discovered accidentally at Leyden by Muschenbroek; but the honor of the discovery has been contested also in favor of Cuneus, a rich burgess of that town, and Kleist, canon of the cathedral of Camin, in Pomerania. Franklin (1747) showed the electric conditions of the Leyden jar, and (1752) proved the identity of lightning and electricity by his kite experiment. The last was performed with the same object about the same time, and quite independently, by Romas of the town of Nerac, in France. In 1760, Franklin made the first lightning-conductor. Canton, Wilke, and Æpinus (1753-59) examined the nature of induction. Ramsden (1768) was the first to construct a plate-machine, and Nairn (1780) a two-fluid cylinder-machine. The electrophorus was invented by Volta in 1775, and the condenser by the same electrician in 1782. In 1786, Galvani made the discovery which led to the addition of the new branch to the science which bears his name, and which now far exceeds the older branch in extent and practical value. See GALVANISM. In 1787, Coulomb, by means of his torsion-balance, investigated the laws of electric attraction and repulsion. In 1837, Faraday published the first of his researches on induction. Armstrong, in 1840, designed his hydro-electric machine.

Fundamental Facts.—Non-conductors are capable of electrical excitation from friction, and are, in consequence, termed electrics, and conductors not so affected are called non-electrics. The *fundamental principles* of electricity are illustrated by the *electric pendulum*. A glass tube bent at right angles, so as to project horizontally, is placed on a convenient stand. On the hook in which its upper end terminates, a cocoon thread is hung, to the end of which a pith-ball is attached. The ball is thus doubly insulated by the glass and the silk thread. If a tube of glass be rubbed by a dry silk handkerchief, and brought near the ball, the ball is at first briskly attracted, and then as briskly repelled; and if the tube be then moved towards it, it moves off, keeping at the same distance from it. The ball being so affected, or charged, as it is called, a rod of shellac or of sealing-wax, after being rubbed with flannel, attracts it, if possible, more briskly than before, and again sends it off exactly as the glass had done. If the glass tube be now again taken up and rubbed a second time, if necessary, the ball will act towards it as it did towards the sealing-wax. The same series of attractions and repulsions would have taken place if we had begun with the sealing-wax instead of the glass tube. We interpret this experiment in the following way: When glass is rubbed with silk, and the silk removed, it is charged with what is called positive electricity. The ball is attracted by it, and becomes on contact also charged with positive electricity, and is then repelled. When sealing-wax is rubbed with flannel, and the flannel removed, it becomes charged with negative electricity, which is the counterpart of positive electricity, for it attracts the positively charged ball, and communicating its own electricity to it, finally repels it. From such an experiment as this, we conclude that *bodies electrified either positively or negatively, attract neutral bodies and bodies affected with electricity of an opposite name to their own, but repel those affected with electricity of the same name; and that electricity can be communicated from one body to another by contact*. For positive and negative (written also + and -), the terms vitreous and resinous are also employed, as glass and resin are the typical substances from which they may be obtained. Contact is not the only way in which electricity is communicated. We find, when we deal with larger bodies than the pith-ball of the experiment, and sometimes even with it, that the passage of a *spark* between two bodies without contact communicates the electricity of the one to the other. The part played by the rubbers in the above experiment must not be overlooked. The silk handkerchief employed to rub the glass assumes the resinous or - electrical state, and the flannel rubber of the sealing-wax the vitreous or +. This cannot, however, be clearly shown, as the experiment is performed, for the rubbers are in each case tightly embraced by the hand, which neutralizes their peculiar electricity. We can perform our fundamental experiment in a way clearly to show this. Let us take for our rubbing and rubbed surfaces two india-rubber balloons inflated with air (such as children play with), and hold them tightly one in each hand. They may be in all respects perfectly alike. Let us then rub them briskly on each other, and then hold the rubbed sides closely together. On bringing the two in contact near the pith-ball, it remains indifferent to them; but if we pull them apart, and put one on each side of the pith-ball, the ball plays actively between them, being attracted and repelled by each in turn. The fact of no attraction occurring when the balloons are together, shows that in the rubbing both electricities are generated in equal quantities, for they neutralize each other when brought near; and the fact that the balloons must be separated proves that all electric phenomena take place in an electric field, with positive electricity at its one termination, and negative electricity at its other. The non-conducting nature of the india-rubber prevents the electricities finally neutralizing in contact, and disappearing by the hands when apart. It is also instructive that as force is exerted and work is done in pulling them apart, we have the equivalent of that work in the form of an electric field capable of doing work. The motion of the pith-ball, and the heating caused by the tiny sparks which charge it, are evidences of the truth of the statement. It is again worthy of note that both balloons

appear exactly alike, and yet they assume opposite electricities. That there must be some difference may be drawn from the next paragraph.

In most cases of friction, the nature of the rubbing and rubbed surfaces determines the kind of electricity which each assumes. Thus, if glass be rubbed by a cat's fur instead of silk, its electricity is — instead of +. In the following list, each body, when rubbed by any one preceding it, is negatively electrified; by any one succeeding it, positively; cat's fur, smooth glass, linen, feathers, wood, paper, silk, shellac, ground glass. When two pieces of the same material are rubbed together, the colder or smoother becomes positively excited. Metal filings rubbing against a plate of the same metal determine — electricity in themselves and + electricity in the plate. When a white silk ribbon is rubbed by a black one of the same texture, the white one becomes +. A plate of glass becomes + when a stream of air is directed against it from a pair of bellows. The friction caused by steam of high tension issuing from a narrow pipe develops electricities in the steam and pipe which depend on the material of the latter. This fact has been turned to advantage by Armstrong in the construction of a boiler electrical machine of immense power.

Induction.—Free electricity has the power of inducing the bodies in its neighborhood to assume a peculiar electrical condition; this is exhibited in the following simple way: A brass cylinder, rounded at both ends, is insulated on a glass pillar. Two pith-balls, hung by cotton threads, are attached at either extremity. When a glass tube is briskly rubbed, and placed within a few inches of the end of the cylinder, the balls at each end diverge, showing that each pair is charged with similar electricities. When the glass tube is withdrawn, the balls hang down as before, so that the electrical excitement of the cylinder is merely temporary and dependent on the proximity of the excited tube. If, while the balls are apart, a *proof plane*, consisting of a small disk of gilt paper insulated at the end of a glass rod, be made to touch the end next the tube, and then transferred to an electrometer, the electricity is found to be —; if the same be done at the other end, it is +. The nearer end of the cylinder is thus induced by the + electricity of the glass to assume the negative electric state; and as no — electricity can be excited without as much + electricity, we find the other end positively electrified to the same extent. It appears, besides, from the positions taken up by them, that *both electricities observe the same attractions and repulsions as the bodies affected by them*. This action of the electricity of the tube inducing in the cylinder this peculiar electrical condition, is called induction; and the cylinder in this state is said to be *polarized*—that is, to have its poles or ends like a magnet, each having its similar, but relatively opposite force. If the hand touch the cylinder, the balls next the tube diverge further than before, and the other two cease to be affected. In this case, electrically speaking, the cylinder is a portion of the ground, for the hand and body are conductors; the ground is thus brought nearer, more — electricity appears, and the + electricity is lost in the spark with the hand. The — electricity is kept fixed in the part of the cylinder opposite the tube by the + electricity of the latter; and when the hand is first removed, and then the tube, it causes the balls at both ends to diverge permanently. We thus see that electricity can be produced and insulated in conductors by the action of free electricity on them. The + electricity of the further half of the cylinder is as free and insulated as if no — electricity existed within it. This is shown by placing a cylinder near the first, forming a continuation of it, as it were, without touching, when the second cylinder, under the induction of the + electricity of the first, is thrown into the same state as the first. This second can induce the same state in a third, and so on. As the excited tube is withdrawn, the whole series return to their natural condition without being in any way permanently affected. The moment, however, it is again brought near, there is manifested at the further termination of the last a + electricity which exerts the same influence there as if a portion of the electricity of the tube had been actually communicated or transferred to it.

The air intervening between the tube and the cylinder is termed the *dielectric*, for it is through it that the electric action is propagated. In proof of this, we have only to place a cake of shellac between the tube and cylinder, when the polarity of the cylinder will rise higher than before, as would be shown by the further divergence of the balls; and if this or a similar experiment be conducted with sufficient care, we find that the inductive action varies in amount for each non-conductor. Induction, therefore, we have reason to conclude, is not the direct action of one body on another, but an action transmitted through, or possibly residing in the medium between them. In further proof of this, Faraday, who was the first to examine the function of the dielectric in induction, has shown that the action takes place through air in curved as well as in straight lines, which implies the action of an intervening medium. The relative powers of different substances in facilitating induction, are termed by this philosopher *their specific inductive capacities*. The following table by sir W. S. Harris gives the specific inductive capacities of the more important non-conducting substances, taking that of air as unity: Air, 1.00; resin, 1.77; pitch, 1.80; beeswax, 1.86; glass, 1.90; sulphur, 1.93; shellac, 1.95; india-rubber, 2.8. All gases, whether simple or compound, have the same inductive capacity, and this is not affected by temperature or density. If a large plate of metal be placed between the glass tube and the cylinder, the polarization of the cylinder instantly vanishes, for the induction is diverted by it into the ground.

Theory of Induction.—Faraday, taking for granted that the dielectric is the essential

medium of induction, suggests that the molecules of air and other dielectrics are conducting, but that they are insulated from each other. We have already seen that by induction, part of the electricity of an insulated body can be in effect transferred to a surface at some distance from it, without any loss experienced by the exciting body. If, now, we could imagine a series of insulated cylinders diverging in all directions from the glass tube, we have reason to expect that the whole of the electricity of the tube would be in effect transferred to their outer extremities without loss of electricity to the tube. To prove that such would be the case, Faraday took a pewter ice-pail, $10\frac{1}{2}$ in. high, and 7 in. in diameter, and insulated it, placing the outside of it in conducting connection with the knob of a gold-leaf electroscope. An insulated ball, charged with + electricity, was then introduced into it without touching. The pail was thus subjected to polarization, the - electricity being on the inner, and the + electricity on the outer surface. The divergence of the leaves increased as the ball was lowered, until it sunk 3 in. below the opening, when they remained steadily at the same points. The ball was lowered till it touched the bottom and communicated its charge to the pail, when the leaves remained in the same state as before, showing that the + electricity developed by induction on the outer surface was exactly the same in amount as that of the ball itself. He then altered the experiment so as to have four insulated pails inside each other, and the effect on the outmost pail was in no way altered. Here the action of the air between the pails was in effect the same as that of the pails themselves, and if the molecules of air were insulated-conductors like these, they would have acted in no way different from what they did. The action of the molecules of air, in certain circumstances, appears to favor the idea that they are individually conducting. The discharge of electricity by spark through the air, shows that they can be forced to act as conductors; and the currents which proceed from points highly charged with electricity, appear to indicate that they can be attracted and repelled like the pith-balls of our first experiment.

Conductors, according to this theory, are bodies whose molecules have the power of communicating their electricities to each other with great ease, whilst non-conductors are those whose molecules only acquire this power under great force. Wheatstone has shown, as we shall afterwards see, that facility of discharge is not perfect even in the best conductors, as time is needed for its propagation, and it has been found that the terminal laminae of non-conductors between two charged plates become penetrated with opposite electricities, which indicates the slow progress of conduction. The molecules of conductors and non-conductors, therefore, have the same power of mutual discharge, but in very different degrees, so that a good non-conductor may be regarded as an excessively slow conductor.

Potential, Density, Tension, Capacity.—Some idea of the meaning of the word *potential* may be got from the following comparison. Suppose we have a supply of water with a certain head, to fill an elastic bag: when the water is admitted, the bag will swell till the elasticity of the bag is equal to the head of water, and then the flow will cease. The potential is the head of water or elasticity of the bag, so many feet high, or so many pounds per square inch. The capacity of the bag is usually the amount it holds, but capacity in an elastic bag is a shifting quantity, and we must use the term in this way if we wish to compare the capacity of two elastic bags—viz., the ratio of the water it holds to the head that filled it. Thus, a bag holding 10 galls., with a head 1 ft., would have a 10 times greater capacity than a bag holding 10 galls. with a head 10 ft.; for if the first were pressed by a head of 10 ft., it would hold 100 galls., the resistance of the bag being supposed to increase with its contents. Now, let us take a somewhat similar electric problem. An insulated ball is connected with a magazine of energy, ready to make electricity flow when occasion offers, such as a galvanic battery. Let the + pole of a gigantic battery be connected with the ball, and the other pole with the ground, electricity will flow to the ball till the air between the ball and the ground presents an electric reaction equal to the potential of the battery. The charge of the ball taken with reference to this potential gives the capacity of the ball. So much, then, for a popular view of these two words. The potential of a body, or any point in the field, is defined thus—viz., *the amount of work that would be expended in bringing a small quantity, a unit of + electricity, from an infinite distance to the body or point.* If the body is positive, the work would be expended; if negative, the work would be done on the body and the potential -. The said unit of + electricity will always move from a point where the potential is high to one where it is lower; in other words, electricity will always flow between two points where there is a difference of potential, and will cease to flow when that difference ceases. If E be charge, V the potential, C the capacity, then $C = E \div V$. From the definition of potential just given, what we have called the potential of the battery in the preceding illustration is in reality its *electro-motive force*, or the difference of potentials of its poles. As these are alike in power, but different in sign, and as the difference of two quantities of unlike sign is their sum, the electro-motive force is twice the potential of one pole. If the charging line be withdrawn, the ball will be in all respects as if charged by an electric machine. The battery having, so long as it acts, an unlimited supply of electricity, its electro-motive force remains the same; but when balls charge one another, the potential falls just as when a limited supply of water has its head reduced when made to run into another vessel. Potential, then, must be estimated by the resistance of the field, or the work value of the unit of charge. The charge being the same, the potential

risks with the smallness of the body, or the thickness of the dielectric. Density is the quantity of electricity on a unit of surface, and *tension* is the strain which Faraday supposes to exist in the molecules of a dielectric when charged. Tension is commonly used in Gt. Britain and abroad for potential, though our best writers never use it now in this sense.

Distribution of Electricity.—We might take it almost as a self-evident truth, that the greater the surface over which electricity is diffused, the less is its electric potential at any particular point, and so we are taught by experiment. When two equal balls are insulated, and a charge is given to one of them, and then communicated to the other by contact with the first, it is found that both equally divide the charge, but that the potential of the electricity of each is one half of that of the originally charged ball. When a watch guard-chain is charged and laid on the plate of an electroscope by means of a glass rod, the gold leaves diverge most when the chain lies in a heap on the plate; and as it is lifted up, the leaves approach each other, showing that as the exposed surface of the chain increases, the electric potential of each part diminishes. The reason of this is obvious. Let us begin with one ball with a certain charge, then take another equal ball and impart half the charge to it by making the two touch. A spark will be seen at the charge of the second ball. The quantity in both is still the same, but energy has been lost by the spark, and the heat generated by the spark is the measure of the loss. If we continue to add ball after ball until we have a very large surface, the quantity is the same as at first, but energy has been squandered in the sparks of each additional ball, and so the potential is lowered.

Experiment teaches us, that electricity is exhibited only on the surfaces of conductors. A brass ball is suspended by a silk thread and covered with two hemispheres, which can be held by insulating handles, and which exactly fit it. A charge is then communicated to the ball so compounded. When the hemispheres are withdrawn, they are found to take away all the electricity with them, not the slightest charge being left in the ball. The same fact is exhibited by a hollow ball placed on a glass pillar, with a hole in the top large enough to admit a proof plane to the inside. When charged, not the faintest evidence of electricity is found on the inner surface, however thin the material of the ball may be. The thinnest metal plate, when under induction, shows opposite electricities on its two faces. We learn from these and numerous other experiments, that *electricity is only found on the outer surfaces of conductors in an envelope of inappreciable thickness*. This fact is quite in keeping with Faraday's theory of the action of dielectrics. Within a conducting body we cannot expect electricity, for the moment it appears in it, the particles communicate their electricities to each other, and the electric state ceases. In a dielectric they cannot communicate, and the charge remains. Hence the charge at the conductor only appears at the junction of a conductor and dielectric.

We are also taught by experiment that the distribution of electricity on the surface of insulated conductors is influenced materially by their form. An electrified ball, for example, exhibits the same density all round, for the resistance is sensibly the same on all sides of it. When, however, a conducting body is made to approach near enough to it, the density of the electricity is found to be greater on the side on which the approach is made. This is proved by the aid of a proof plane and an electrometer. When work is done in drawing away the proof planes from the charged body, its potential, as tested by the electrometer, is proportional to the density of the charge at the point where it touched. The reason of this unequal distribution is obvious, from the fact that the potential of the ball must be the same at every point. If, therefore, the resistance at one side be less than at another, the density there must be greater to maintain equality of potential. The disturbance of equal distribution here spoken of holds true only for short distances; the disturbing body, for instance, in the case under consideration, has to be brought very near before any inequality in the distribution of electricity on the ball becomes manifest. It is to this concentration of electricity on the side of the approaching conductor that we owe the electric spark; and it is as we near the striking or sparking distance that this disturbance is revealed. The concentration or fixing of electricity on the side of the thinnest and best dielectric, is particularly illustrated in the condenser (q.v.) and Leyden jar, whose action depends upon it; but in these the dielectric must be very thin to secure decided effect. When a conductor somewhat in the form of a prolate spheroid is charged, and the electric density of the several parts tested by the proof plane, it is found to be least at the thickest part, and to increase towards either end; and the difference is found to be all the greater as each end becomes more and more pointed. It is found likewise that the electric density on a point is so great with a considerable charge as to destroy the dielectric condition of the air, the particles of which become electrified and carry by convection the charge of the point to surrounding conductors. We therefore learn that *electricity concentrates on points and projections*. A similar reasoning with regard to the relations of potential resistance and consequent density bears here as in the previous case. It may be here remarked that the density of charge at any point regulates the amount of tension at that point on the molecules of the dielectric. The constraint which they experience in being charged, and which Faraday calls tension, can only be carried to a certain limit. When that is reached, the molecules are forced to be conducting, and the tension ceases.

Static electricity for experimental purposes is now obtained from machines which ap-

ply friction to suitable substances, such as glass, rubber, etc. In a tube of glass and silk rubber we have the embryo of the electric machine, viz., a body which, when rubbed, is positively electrified, and its rubber negatively. The first requisite we should expect in a machine of this nature is a large surface, to give a great amount of electricity. But there is another already casually referred to; glass being a non-conductor, the electricity formed on its surface has not a combined action, so that some arrangement is necessary to collect it, and render it available—to act, in fact, as its conducting reservoir. This portion of the machine is denominated the *prime conductor*. The rubbed surface of the electric machines is either a cylinder or plate of glass; hence we distinguish them into cylinder machines and plate machines. The former, from their more compact form, are the more manageable; and the latter, from both sides of the glass plate being rubbed, are the more powerful forms of the instrument. The description of Winter's plate machine (fig. 1) will be quite sufficient to show the general requirements and construction of electric machines. It is one of the best existing forms of the machine. The glass plate is turned on the axis *ab* by means of the handle *c*. The longer end of this axis, consisting of a glass rod, moves in the wooden pillar *d*, and the other rests in the wooden head of the glass pillar *e*. The plate is thus completely insulated, and little loss of electricity takes place through its supports. The two rubbers are triangular pieces of wood, covered with a padding of one or two layers of flannel enclosed in leather, and they present a flat, hard surface to the glass, so that friction between it and them takes place in every part. They are placed in a wooden frame on each side of the plate, and the pressure is regulated by metal springs fixed to the outside between them and the frame. Before use they are covered with an amalgam of mercury, zinc, and tin, which is made to adhere with the aid of a little grease, and which increases immensely the production of electricity. The surfaces of the rubbers are therefore conducting, and are made to communicate by strips of tin-foil with the *negative conductor*, *f* (fig. 1). To limit the electric field in the neighborhood of the negative conductor, or, which is the same thing, to keep the potential of the glass from rising too high, so as to cause a discharge back into the rubbers, each rubber has a non-conducting wing fastened to it, which is made of several sheets of oiled silk, kept together by shellac varnish, beginning at the rubber with several, and ending with one or two sheets. When the machine is in action, electrical attraction makes them adhere to the plate; but when it is out of action, they may be kept up by a split pin *g*. As the plate turns, the rubbers are kept in the frame by their ledges *h*. The whole framework of the rubbers and negative conductor is supported by the short glass pillar *i*, so that it can be insulated when required. The prime conductor, *k*, is a brass ball insulated on the long glass pillar, *l*, and to prevent the edges of the ball at the junction dissipating the electricity, the pillar enters the ball by a trumpet-shaped opening. The collection of the electricity from the glass is made by a row of points placed in the grooves, inside of two wooden rings, *m, m*, which are attached on each side of the plate to a piece of brass projecting horizontally from the ball of the conductor. The grooves are covered with tin-foil, which conveys the collected electricity to the ball, and the points are kept out of the way of injury by not projecting beyond the grooves.

FIG. 1. Electric Machine.

Electrometers and Electroscopes.—These words are generally taken as synonymous; electroscopes, however, should be applied to the instruments which give evidence of electrical potential without giving the exact measure of it; and electrometers to such as show both. Of late years, immense progress has been made in the construction of delicate electrometers, chiefly to meet the demands for such in the working or testing of submarine cables. Sir William Thomson's quadrant electrometer and his absolute electrometer, in point of exactness and delicacy, are a hundredfold in advance of previous instruments. We shall here, meanwhile, describe the common forms of electric indicators. The *quadrant electrometer* consists of a conducting-rod, generally of box-wood or brass, with a graduated semicircle attached above, in the center of which is a pivot for the rotation of a straw carrying a pith-ball at its outer end. It is used for a charge of high potential, such as that of the electric machine. When placed on the prime conductor of the machine, the whole becomes charged with + electricity; the ball is repelled first by the electricity of the rod, then by that of the prime conductor, the height to which it rises being seen on the semicircle. This is not an electrometer in the strict sense of the word, for although it tells us, by the straw rising and falling, when one potential is greater or less than another, it does not tell us by how much, the conditions of its repulsion being too complicated for simple mathematical expression. It can show us, however, by the indicator standing at the same point, when the electric potential of the machine is the same at one time as another.

Leyden Jar. —This is a glass jar, with a coating of tin-foil pasted carefully inside and out, extending to within a few inches of the mouth. This last is generally closed by a wooden stopper, through which passes the stalk of a brass knob or ball surmounting the whole. The connection between the inside coating and the ball is completed by a chain extending from the stalk to the bottom of the jar. If this jar be put on an insulating stool, so that sparks can pass from the prime conductor of a machine to the knob, when the jar is thus insulated, one or two sparks pass, and then the charge seems complete, for no more sparks will follow, though the action of the machine is continued; or, if they do, they are immediately dissipated from the knob in a brush discharge. If, then, however, the knuckle of the experimenter be brought near the outer coating, sparks begin again to pass freely; and for every spark of $+$ electricity that passes between the machine and the knob, a corresponding spark of the same name passes between the knuckle and outer coating. This continues for some time, and then the jar appears to be again saturated. It is now said to be fully charged. The outside of the jar can, in this state, be handled freely, and if it be still on the insulating stool, so may also the knob, although, when the hand first approaches, it receives a slight spark. But if, when the experimenter has one hand on the outer coating, he bring the other hand to the knob, before it can reach it, a straight, highly brilliant spark passes between the knob and his hand, and he experiences a shock of great violence. If he try the same thing again, a feeble spark and shock again ensue, and the jar is now thoroughly discharged. As it is highly inconvenient, if not dangerous, to discharge the jar through the body, *discharging tongs* are used for that purpose, which consist of two brass arms ending in balls, and moved on a hinge by glass handles.

The velocity of electrical discharge is found to be about 192,000 m. per second.

ELECTRICITY, STORAGE OF. A storage of energy which is able to directly produce an electric current. The term is a misnomer, as electricity itself cannot be stored. A so-called storage battery or accumulator when acted upon by a current undergoes a certain chemical change. The chemicals which are thus separated recombine again when the circuit of the battery is closed, and in uniting give off a current of electricity about equal to that by which they were decomposed. Lead is the metal most commonly used in accumulators, the positive plate having a coating of lead peroxide, PbO_2 , and the negative plate a surface of spongy lead.

The idea of electrical storage may be traced back to 1801, at which time Gautherot showed that platinum wires used in the electrolysis of saline solutions developed secondary currents. Later, Ritter constructed a secondary pile of copper discs separated by cloths moistened with a solution of sal ammoniac. By charging this a few moments with a powerful galvanic battery, the pile gave a strong shock. Volta, Becquerel and others discovered that other metals, as gold, silver, and platinum, gave secondary electric currents when subjected to electrolytic action in certain solutions. In 1842, Grove produced his celebrated gas battery, which gave a current by means of the difference in polarity of oxygen and hydrogen, the constituents of water. With a battery of 50 gas cells Grove produced arc lights, electrolysis, and many well-known effects. In Faraday's "Researches" he mentions the high conductivity of peroxide of lead and its power of giving up its oxygen. He also discovered, in electrolysing a solution of acetate of lead, that peroxide of lead was produced at the positive, and spongy metallic lead at the negative pole. Gaston Planté was the first to apply this principle to a secondary cell, which was afterwards developed and modified by Faure and others.

A great deal of attention has been given to the nature of the chemical reactions in the lead-sulphuric acid cell, and it cannot be said that these chemical changes are well understood yet. In a general way, however, they are sufficiently well known to enable manufacturers to produce cells of any desired capacity and rate of discharge. Storage batteries may be divided into two general classes: Those in which the active material (peroxide of lead) is formed on the surface of the plates by chemical or electro-chemical action, and those in which some easily reducible salt of lead is applied mechanically. The former are known as the Planté type, and the latter as the "pasted" or Faure type.

The Planté cell is the simplest form of storage battery. The earliest cells were formed of two lead plates immersed in a dilute solution of sulphuric acid in water. The solution should have a specific gravity of 1.17 before charging, and as the charge proceeds the specific gravity increases to 1.195 at full charge. At each successive charge the peroxide formed on the positive plate sinks deeper into the metal, and this action continues until the metal is covered to a sufficient thickness to protect the lead from electrolytic action. There is no difficulty in forming the positive plate in a Planté cell, but with the negative plate the action is very slow. The latter is the great difficulty with all Planté cells. The usual method of forming the spongy lead is to charge the cell, allow it to rest, then reverse the charge through the cell. At each reversal of current the peroxide is liberated at the surface, leaving metallic lead in a very finely divided state. The voltage of a lead-sulphuric acid cell is about 2 volts. The above description is applicable in a general way to all cells of the Planté type, of which there are a great many varieties. Most of the modifications introduced by different manufacturers are mechanical changes with a view to exposing more surface of lead to the action of the electrolyte. Many of these plates are corrugated, built up of very thin sheets slightly separated, grooved, etc., and are too numerous to describe in detail. The Planté accumulator is a very efficient

cell when once formed, but the great amount of time it requires for forming is its chief drawback.

Pasted cells of the Faure type are now the most important and generally used cells. To avoid the great loss of time used in forming the Planté cells, Faure devised the method of pasting a layer of chemically prepared oxide of lead to the surface of the plates. This was done by spreading the plates with minimum, or litharge, made into a thick paste by the addition of acidulated water. After drying, these plates were placed in a bath of dilute sulphuric acid, and then subjected to an electric current. A piece of felt was placed between the plates to prevent the lead salts from disintegrating. After charging, the salt on positive plate is reduced to peroxide of lead, while that on the negative plate is converted into porous lead. The chief fault of the early Faure cells was the disintegration of the active material, which would drop away from the plate. Many methods have been devised for holding the active material on the plates, the most common of which is to cast a grid, or plate with cells or perforations, into which the active material is pressed. All of the modern cells are made with perforated plates of this description. Besides these two types of accumulators, which are the most important ones, there are a number of others, in which the elements are composed of lead-zinc, copper, etc., none of which are in very extensive use.

The use of the storage battery has grown considerably in recent years, and yet it is still very far from being a satisfactory article. Its efficiency varies from 60 to 75 per cent., and its depreciation may be very rapid if it is not operated with great care. Its use in electric light stations to take extra loads and light all-night loads, has been found advantageous, and most of the large central stations have auxiliary storage plants. It is very important not to discharge accumulators faster than the rate for which they are built, as it results in the speedy destruction of the plates. They are not well adapted to traction purposes, as the motion of the car jars out the active material from the plates, and in starting the car a high rate of discharge is required. The weight and bulk of accumulators is also against their use on cars.

ELECTRIC LIGHTING. The first practical application of electricity was as a means of furnishing artificial light, and this has been the most extensively developed of its uses. The first electric light was that made by sir Humphry Davy in 1809, at the Royal institution in London, when on separating the ends of the wires leading from a battery of two thousand cells, which was the largest battery that had ever been constructed, a brilliant light was seen. This was due to the heating of the ends of the wire

FIG. 1.

FIG. 2.

by the passing current. A few lamps were made to give light in this way, with a simple apparatus illustrated in fig. 1, but electricity was too expensive to allow lights so produced to be used to any extent until the invention of dynamo generators of electricity, about 1870. Then Jablochkoff introduced his electric candle, which was seen by all the world

in Paris in 1870. And although it did not furnish a means of producing an economical light, it did a great deal to awaken public interest in the new means of illumination. The Jablochkoff candle was immediately followed by a number of other lamps of greater simplicity, and consequently of great commercial value. These improvements in the lamp, together with the improvements in dynamos, have advanced the art of electric lighting to a position of successful competition, with all other methods of artificial illumination. The early forms of arc lamps possessed very bad features of regulation, that is, the method of feeding the carbons so that the arc is maintained constant as the carbon burns away. Lamps are generally made with the lower carbon stationary and the upper one to feed downwards. The feeding is operated either by a train of wheel-work, electrical or mechanical motors, gravity, or the action of a solenoid. When the lamp is not in operation, the upper carbon falls and rests upon the lower one,

but when the current is passed through them they are separated the required distance by means of an electro-magnet whose coils are traversed by the whole current of the lamp. In order to maintain the carbons the proper distance apart, the upper carbon is held by a clutch or other device whose position is controlled by an electro-magnet. The coils of this electro-magnet are a shunt or branch off the main circuit, of high resistance. When the carbons are at their normal distance apart, the current of the shunt circuit is not of sufficient strength to move the clutch from the position in which it prevents the downward motion of the carbon rod, but when the carbon has sufficiently burned away to increase the resistance of the arc to a determined extent, the increased current which is thereby produced through the shunt circuit is then sufficiently strong to release the clutch and permit the carbon to feed downward. In a well regulated lamp this feeding occurs so gradually that it produces no perceptible effect on the steadiness of the light. Arc lamps require a pressure of about 45 volts to maintain the arc across the separated carbons. Formerly arc lamps were always used in series, that is, the current entered the first lamp, passed successively through each following lamp, and from the last lamp returned to the generator. As each lamp requires 45 volts, and often 100 or 125 lamps are used in series, the voltage of the current will be the sum of the voltages of all the lamps in one series. The lamps as made at the present day require a current of from 8 to 10 amperes. The above description applies to lamps for a direct current. Lamps are also made for alternating currents, but are not so efficient as those described, and are comparatively little used. Another style of lamp which has come into extensive use is adapted to burn on an incandescent light circuit. These circuits are about 100 volts in pressure, and the lamps are run two in series. Each series of two lamps is connected between the conductors leading from the positive and negative pole, or in other words, each pair of lamps is connected in multiple. It is apparent that if in a series circuit any one lamp breaks the circuit no current will pass through any of the lamps. To obviate this trouble each lamp is provided with an automatic cut-out. This consists essentially of an electro-magnet in a shunt circuit, arranged so that if the resistance of the lamp gets too high the current around the magnet increases up to a point at which the magnet moves an armature, which closes a by-path for the main current around the lamp, thus cutting it out of the series. Double carbon lamps were introduced to increase the length of time the lamps would burn without renewing the carbons. In these lamps one pair of carbons are consumed before the other pair come into use. Another lamp designed for longer life of the carbons is known as the incandescent arc lamp. The ordinary arc lamp requires trimming every night, and some of them twice a night. The carbons in the incandescent arc light will burn about a week, or from 80 to 100 hours. This is effected by enclosing the arc in a globe or chamber made as nearly air-tight as possible, consistent with allowing the carbon to feed through the top of it. A small valve opening outwards is connected with the chamber. When the lamp is lighted, the intense heat of the arc expands the air in the chamber and forces out a part of it through the valve, which also prevents the admission of outside air to the chamber. The carbons then burn in a rarefied atmosphere, and the leakage of air into the chamber is so slow that the carbons are oxidized but very slowly. This class of lamps has been perfected within two or three years, and its use especially for interior lighting has grown considerably.

Incandescent electric lighting was introduced by Edison in 1880. Previous to that date many attempts to "subdivide the electric light," as the problem was then called, had failed for want of a suitable substance for the filament of the incandescent lamp. Outside of some of the metals which proved failures, carbon is the only substance yet known which is a conductor of electricity and will stand a sufficiently high temperature for use as incandescent lamp filaments. The carbon strip or filament is bent into the shape of a horse shoe or loop and placed inside of a glass bulb called the lamp chamber. The lamp chamber is exhausted by means of a mercury pump (See AIR PUMP) after which it is hermetically sealed. The exhaustion of the bulb should be as perfect as possible, and in order to insure the complete removal of all the air in the bulb, and the occluded gases in the carbon filament, both the bulb and filament are heated to a high temperature during the latter part of the process of exhaustion. Both the exhaustion and the heating of the lamp must be continued up to the moment that it is sealed. The ends of the filament are attached to platinum wires passing through one end of the glass bulb, and are called leading-in wires. These must be of platinum because this metal expands with the heat in nearly the same proportion as glass, and in the case of any other metal the expansion would either crack the glass or allow air to be admitted at the joint. Filaments are prepared from numerous substances, such as silk, hair, wood fibre, cotton, cellulose, &c. These substances require baking at high temperatures in order to reduce them to pure carbon, their other constituents being driven off by the heat. In some processes of making filaments no treatment is required after the baking, as the filament is then turned out perfectly even in cross section throughout its length. Most filaments are not perfectly even in diameter over their whole length, and any unevenness makes either bright or dull spots when lighted. To correct this the filament is burned for a few moments in a hydro-carbon vapor. The spots which burn brightest on the filament are those of smallest diameter, and they have a higher temperature than the rest of the filament. Now carbon is deposited from the hydro-carbon on to the filament when a certain temperature is reached, and the higher the temperature the faster the deposit. The spots of higher temperature will take on the deposit of carbon
